6.494 decaf::lang::exceptions::NoSuchElementException Class Reference

`#include <src/main/decaf/lang/exceptions/NoSuchElementException.h>`Inheritance diagram for decaf::lang::exceptions::NoSuchElementException:

Public Member Functions

- **NoSuchElementException** () throw ()
  Default Constructor.
- **NoSuchElementException** (const **Exception** &ex) throw ()
  Conversion Constructor from some other ***Exception*** *(p. 1574).*
- **NoSuchElementException** (const **NoSuchElementException** &ex) throw ()
  Copy Constructor.
- **NoSuchElementException** (const char *file, const int lineNumber, const std::exception ***cause**, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- **NoSuchElementException** (const std::exception ***cause**) throw ()
  Constructor.
- **NoSuchElementException** (const char *file, const int lineNumber, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occured.
- virtual **NoSuchElementException** * **clone** () const
  Clones this exception.
- virtual ~**NoSuchElementException** () throw ()

6.494.1 Constructor & Destructor Documentation

6.494.1.1 decaf::lang::exceptions::NoSuchElementException::NoSuchElementException () throw () `[inline]`

Default Constructor.

6.494.1.2 decaf::lang::exceptions::NoSuchElementException::NoSuchElementException (const Exception & *ex*) throw () `[inline]`

Conversion Constructor from some other **Exception** (p. 1574).

Parameters:

ex The **Exception** (p. 1574) whose data is to be copied into this one.

6.494.1.3 decaf::lang::exceptions::NoSuchElementException::NoSuchElementException (const NoSuchElementException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex The **Exception** (p. 1574) whose data is to be copied into this one.

6.494.1.4 decaf::lang::exceptions::NoSuchElementException::NoSuchElementException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.494.1.5 decaf::lang::exceptions::NoSuchElementException::NoSuchElementException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause **Pointer** (p. 2497) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.494.1.6 decaf::lang::exceptions::NoSuchElementException::NoSuchElementException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occured. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.494.1.7 virtual decaf::lang::exceptions::NoSuchElementException::~NoSuchElementException () throw () [inline, virtual]

6.494.2 Member Function Documentation

6.494.2.1 virtual NoSuchElementException* decaf::lang::exceptions::NoSuchElementException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1574) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1577).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**NoSuchElementException.h**

6.495 decaf::security::NoSuchProviderException Class Reference

`#include <src/main/decaf/security/NoSuchProviderException.h>`Inheritance diagram for decaf::security::NoSuchProviderException:

Public Member Functions

- **NoSuchProviderException** () throw ()
  Default Constructor.
- **NoSuchProviderException** (const Exception &ex) throw ()
  Conversion Constructor from some other Exception.
- **NoSuchProviderException** (const **NoSuchProviderException** &ex) throw ()
  Copy Constructor.
- **NoSuchProviderException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- **NoSuchProviderException** (const std::exception *cause) throw ()
  Constructor.
- **NoSuchProviderException** (const char *file, const int lineNumber, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occured.
- virtual **NoSuchProviderException** * **clone** () const
  Clones this exception.
- virtual ~**NoSuchProviderException** () throw ()

6.495.1 Constructor & Destructor Documentation

6.495.1.1 decaf::security::NoSuchProviderException::NoSuchProviderException () throw () [inline]

Default Constructor.

6.495.1.2 decaf::security::NoSuchProviderException::NoSuchProviderException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.495.1.3 decaf::security::NoSuchProviderException::NoSuchProviderException (const NoSuchProviderException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.495.1.4 decaf::security::NoSuchProviderException::NoSuchProviderException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.495.1.5 decaf::security::NoSuchProviderException::NoSuchProviderException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.495.1.6 decaf::security::NoSuchProviderException::NoSuchProviderException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occured. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.495.1.7 virtual decaf::security::NoSuchProviderException::~NoSuchProviderException () throw () [inline, virtual]

6.495.2 Member Function Documentation

6.495.2.1 virtual NoSuchProviderException* decaf::security::NoSuchProviderException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented from **decaf::security::GeneralSecurityException** (p. 1708).

The documentation for this class was generated from the following file:

- src/main/decaf/security/**NoSuchProviderException.h**

6.496 decaf::lang::exceptions::NullPointerException Class Reference

`#include <src/main/decaf/lang/exceptions/NullPointerException.h>`Inheritance diagram for decaf::lang::exceptions::NullPointerException:

Public Member Functions

- **NullPointerException** () throw ()
  Default Constructor.
- **NullPointerException** (const **Exception** &ex) throw ()
  *Conversion Constructor from some other **Exception** (p. 1574).*
- **NullPointerException** (const **NullPointerException** &ex) throw ()
  Copy Constructor.
- **NullPointerException** (const char *file, const int lineNumber, const std::exception ***cause**, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- **NullPointerException** (const std::exception ***cause**) throw ()
  Constructor.
- **NullPointerException** (const char *file, const int lineNumber, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occured.
- virtual **NullPointerException** * **clone** () const
  Clones this exception.
- virtual ~**NullPointerException** () throw ()

6.496.1 Constructor & Destructor Documentation

6.496.1.1 decaf::lang::exceptions::NullPointerException::NullPointerException () throw () [inline]

Default Constructor.

6.496.1.2 decaf::lang::exceptions::NullPointerException::NullPointerException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1574).

Parameters:

ex The **Exception** (p. 1574) whose data is to be copied into this one.

6.496.1.3 decaf::lang::exceptions::NullPointerException::NullPointerException (const NullPointerException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex The **Exception** (p. 1574) whose data is to be copied into this one.

6.496.1.4 decaf::lang::exceptions::NullPointerException::NullPointerException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.496.1.5 decaf::lang::exceptions::NullPointerException::NullPointerException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause **Pointer** (p. 2497) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.496.1.6 decaf::lang::exceptions::NullPointerException::NullPointerException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occured. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.496.1.7 virtual decaf::lang::exceptions::NullPointerException::~NullPointerException () throw () [inline, virtual]

6.496.2 Member Function Documentation

6.496.2.1 virtual NullPointerException* decaf::lang::exceptions::NullPointerException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1574) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1577).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**NullPointerException.h**

6.497 decaf::lang::Number Class Reference

The abstract class **Number** (p. 2432) is the superclass of classes **Byte** (p. 840), **Double** (p. 1537), **Float** (p. 1647), **Integer** (p. 1762), **Long** (p. 2057), and **Short** (p. 2906).

`#include <src/main/decaf/lang/Number.h>`Inheritance diagram for decaf::lang::Number:

Public Member Functions

- virtual ~**Number** ()
- virtual unsigned char **byteValue** () const

  Answers the byte value which the receiver represents.

- virtual double **doubleValue** () const =0

  Answers the double value which the receiver represents.

- virtual float **floatValue** () const =0

  Answers the float value which the receiver represents.

- virtual int **intValue** () const =0

  Answers the int value which the receiver represents.

- virtual long long **longValue** () const =0

  Answers the long value which the receiver represents.

- virtual short **shortValue** () const

  Answers the short value which the receiver represents.

6.497.1 Detailed Description

The abstract class **Number** (p. 2432) is the superclass of classes **Byte** (p. 840), **Double** (p. 1537), **Float** (p. 1647), **Integer** (p. 1762), **Long** (p. 2057), and **Short** (p. 2906). Subclasses of **Number** (p. 2432) must provide methods to convert the represented numeric value to byte, double, float, int, long, and short.

6.497.2 Constructor & Destructor Documentation

6.497.2.1 virtual decaf::lang::Number::~Number () [inline, virtual]

6.497.3 Member Function Documentation

6.497.3.1 virtual unsigned char decaf::lang::Number::byteValue () const [inline, virtual]

Answers the byte value which the receiver represents.

Returns:

byte the value of the receiver.

Reimplemented in **decaf::lang::Byte** (p. 842), **decaf::lang::Character** (p. 984), **decaf::lang::Double** (p. 1539), **decaf::lang::Float** (p. 1649), **decaf::lang::Integer** (p. 1765), **decaf::lang::Long** (p. 2060), and **decaf::lang::Short** (p. 2908).

6.497.3.2 virtual double decaf::lang::Number::doubleValue () const [pure virtual]

Answers the double value which the receiver represents.

Returns:

double the value of the receiver.

Implemented in **decaf::lang::Byte** (p. 843), **decaf::lang::Character** (p. 985), **decaf::lang::Double** (p. 1541), **decaf::lang::Float** (p. 1650), **decaf::lang::Integer** (p. 1766), **decaf::lang::Long** (p. 2061), **decaf::lang::Short** (p. 2909), and **decaf::util::concurrent::atomic::AtomicInteger** (p. 635).

6.497.3.3 virtual float decaf::lang::Number::floatValue () const [pure virtual]

Answers the float value which the receiver represents.

Returns:

float the value of the receiver.

Implemented in **decaf::lang::Byte** (p. 844), **decaf::lang::Character** (p. 985), **decaf::lang::Double** (p. 1542), **decaf::lang::Float** (p. 1652), **decaf::lang::Integer** (p. 1767), **decaf::lang::Long** (p. 2062), **decaf::lang::Short** (p. 2910), and **decaf::util::concurrent::atomic::AtomicInteger** (p. 635).

6.497.3.4 virtual int decaf::lang::Number::intValue () const [pure virtual]

Answers the int value which the receiver represents.

Returns:

int the value of the receiver.

Implemented in **decaf::lang::Byte** (p. 844), **decaf::lang::Character** (p. 986), **decaf::lang::Double** (p. 1542), **decaf::lang::Float** (p. 1653), **decaf::lang::Integer** (p. 1767), **decaf::lang::Long** (p. 2062), **decaf::lang::Short** (p. 2910), and **decaf::util::concurrent::atomic::AtomicInteger** (p. 637).

6.497.3.5 virtual long long decaf::lang::Number::longValue () const [pure virtual]

Answers the long value which the receiver represents.

Returns:

long long the value of the receiver.

Implemented in **decaf::lang::Byte** (p. 844), **decaf::lang::Character** (p. 987), **decaf::lang::Double** (p. 1543), **decaf::lang::Float** (p. 1653), **decaf::lang::Integer** (p. 1768), **decaf::lang::Long** (p. 2063), **decaf::lang::Short** (p. 2910), and **decaf::util::concurrent::atomic::AtomicInteger** (p. 637).

6.497.3.6 virtual short decaf::lang::Number::shortValue () const [inline, virtual]

Answers the short value which the receiver represents.

Returns:

short the value of the receiver.

Reimplemented in **decaf::lang::Byte** (p. 846), **decaf::lang::Character** (p. 988), **decaf::lang::Double** (p. 1545), **decaf::lang::Float** (p. 1655), **decaf::lang::Integer** (p. 1772), **decaf::lang::Long** (p. 2067), and **decaf::lang::Short** (p. 2912).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Number.h**

6.498 decaf::lang::exceptions::NumberFormatException Class Reference

`#include <src/main/decaf/lang/exceptions/NumberFormatException.h>`Inheritance diagram for decaf::lang::exceptions::NumberFormatException:

Public Member Functions

- **NumberFormatException** ()

  Default Constructor.

- **NumberFormatException** (const **Exception** &ex) throw ()

  Conversion Constructor from some other ***Exception*** *(p. 1574).*

- **NumberFormatException** (const **NumberFormatException** &ex) throw ()

  Copy Constructor.

- **NumberFormatException** (const char *file, const int lineNumber, const std::exception *__cause__, const char *msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.

- **NumberFormatException** (const std::exception *__cause__) throw ()

  Constructor.

- **NumberFormatException** (const char *file, const int lineNumber, const char *msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occured.

- virtual **NumberFormatException** * **clone** () const

  Clones this exception.

- virtual ~**NumberFormatException** () throw ()

6.498.1 Constructor & Destructor Documentation

6.498.1.1 decaf::lang::exceptions::NumberFormatException::NumberFormatException () [inline]

Default Constructor.

Referenced by clone().

6.498.1.2 decaf::lang::exceptions::NumberFormatException::NumberFormatException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1574).

Parameters:

ex The **Exception** (p. 1574) whose data is to be copied into this one.

6.498.1.3 decaf::lang::exceptions::NumberFormatException::NumberFormatException (const NumberFormatException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex The **Exception** (p. 1574) whose data is to be copied into this one.

6.498.1.4 decaf::lang::exceptions::NumberFormatException::NumberFormatException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

References decaf::lang::Exception::buildMessage(), and decaf::lang::Exception::setMark().

6.498.1.5 decaf::lang::exceptions::NumberFormatException::NumberFormatException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause **Pointer** (p. 2497) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.498.1.6 decaf::lang::exceptions::NumberFormatException::NumberFormatException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occured. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

References decaf::lang::Exception::buildMessage(), and decaf::lang::Exception::setMark().

6.498.1.7 virtual decaf::lang::exceptions::NumberFormatException::~NumberFormatException () throw () [inline, virtual]

6.498.2 Member Function Documentation

6.498.2.1 virtual NumberFormatException* decaf::lang::exceptions::NumberFormatException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1574) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1577).

References NumberFormatException().

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**NumberFormatException.h**

6.499 cms::ObjectMessage Class Reference

Place holder for interaction with JMS systems that support Java, the C++ client is not responsible for deserializing the contained Object.

`#include <src/main/cms/ObjectMessage.h>`Inheritance diagram for cms::ObjectMessage:

Public Member Functions

- virtual ~**ObjectMessage** ()

6.499.1 Detailed Description

Place holder for interaction with JMS systems that support Java, the C++ client is not responsible for deserializing the contained Object. serialized `ObjectMessage` (p. 2438)s.

Since:

1.0

6.499.2 Constructor & Destructor Documentation

6.499.2.1 virtual cms::ObjectMessage::~ObjectMessage () [inline, virtual]

The documentation for this class was generated from the following file:

- src/main/cms/**ObjectMessage.h**

6.500 decaf::security_provider::unix::openssl::OpenSSLX500Principal Class Reference

The `OpenSSLX500Principal` (p. 2439) wraps around an OpenSSL `X509_NAME` structure.

`#include <src/main/decaf/security_provider/unix/openssl/OpenSSLX500Principal.h>`

Public Member Functions

- **OpenSSLX500Principal** (X509_NAME *name)
  Constructor.
- virtual ~**OpenSSLX500Principal** ()
  Destructor.
- virtual X509_NAME * **getX509Name** ()
  Accessor to the underlying X509 name structure.
- virtual bool **equals** (const Principal &another) const
  Compares two principals to see if they are the same.
- virtual std::string **getName** () const
  Returns the distinguished name string using the RFC2253 formatting.
- virtual void **getEncoded** (std::vector< unsigned char > &output) const
  Serializes the distinguished name to its ASN.1 DER encoded form.

Static Public Member Functions

- static void **getEncoded** (X509_NAME *name, std::vector< unsigned char > &output)
  Serializes the given distinguished name to its ASN.1 DER encoded form.
- static std::string **toString** (X509_NAME *name) const
  Converts the given name to a string using the RFC2253 formatting.

6.500.1 Detailed Description

The `OpenSSLX500Principal` (p. 2439) wraps around an OpenSSL `X509_NAME` structure. It does not, however, control the lifetime of the structure.

6.500.2 Constructor & Destructor Documentation

6.500.2.1 decaf::security_provider::unix::openssl::OpenSSLX500Principal::OpenSSLX500Principal (X509_NAME * *name*)

Constructor. Saves the internal X509 name and caches the string representation of the name.

Parameters:

name The underlying X509 name structure.

6.500.2.2 virtual decaf::security_-provider::unix::openssl::OpenSSLX500Principal::~OpenSSLX500Principal () [inline, virtual]

Destructor. Does nothing.

6.500.3 Member Function Documentation

6.500.3.1 virtual bool decaf::security_-provider::unix::openssl::OpenSSLX500Principal::equals (const Principal & *another*) const [virtual]

Compares two principals to see if they are the same.

Parameters:

another A principal to be tested for equality to this one.

Returns:

true if the given principal is equivalent to this one.

6.500.3.2 static void decaf::security_-provider::unix::openssl::OpenSSLX500Principal::getEncoded (X509_NAME * *name*, std::vector< unsigned char > & *output*) [static]

Serializes the given distinguished name to its ASN.1 DER encoded form.

Parameters:

name the X509 name structure to be encoded.

output Receives the distinguished name in ASN.1 DER encoded form.

6.500.3.3 virtual void decaf::security_-provider::unix::openssl::OpenSSLX500Principal::getEncoded (std::vector< unsigned char > & *output*) const [inline, virtual]

Serializes the distinguished name to its ASN.1 DER encoded form.

Parameters:

output Receives the distinguished name in ASN.1 DER encoded form.

6.500.3.4 virtual std::string decaf::security_provider::unix::openssl::OpenSSLX500Principal::getName () const [inline, virtual]

Returns the distinguished name string using the RFC2253 formatting.

Returns:

the RFC2253 formatted distinguished name string.

References toString().

6.500.3.5 virtual X509_NAME* decaf::security_provider::unix::openssl::OpenSSLX500Principal::getX509Name () [inline, virtual]

Accessor to the underlying X509 name structure.

6.500.3.6 static std::string decaf::security_provider::unix::openssl::OpenSSLX500Principal::toString (X509_NAME * *name*) const [static]

Converts the given name to a string using the RFC2253 formatting.

Parameters:

name the X509 name structure to be formatted.

Returns:

the RFC2253 formatted name string.

Referenced by getName().

The documentation for this class was generated from the following file:

6.501.1 Constructor & Destructor Documentation

6.501.1.1 virtual decaf::security_provider::unix::openssl::OpenSSLX509Certificate::~OpenSSLX509Certificate () [virtual]

6.501.2 Member Function Documentation

6.501.2.1 virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::checkValidity (const decaf::util::Date & *date*) const throw (CertificateExpiredException, CertificateNotYetValidException) [pure virtual]

Implements **decaf::security::cert::X509Certificate** (p. 3407).

6.501.2.2 virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::checkValidity () const throw (CertificateExpiredException, CertificateNotYetValidException) [pure virtual]

Implements **decaf::security::cert::X509Certificate** (p. 3408).

6.501.2.3 virtual bool decaf::security_provider::unix::openssl::OpenSSLX509Certificate::equals (const Certificate & *cert*) const [pure virtual]

Compares the encoded form of the two certificates.

Parameters:

cert The certificate to be tested for equality with this certificate.

Returns:

true if the given certificate is equal to this certificate.

6.501.2.4 virtual int decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getBasicConstraints () const [pure virtual]

Implements **decaf::security::cert::X509Certificate** (p. 3408).

6.501.2.5 virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getEncoded (std::vector< unsigned char > & *output*) const throw (CertificateEncodingException) [pure virtual]

Provides the encoded form of this certificate.

Parameters:

output Receives the encoded form of this certificate.

Exceptions:

CertificateEncodingException if an encoding error occurs

Implements **decaf::security::cert::Certificate** (p. 969).

6.501.2.6 virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getIssuerUniqueID (std::vector< bool > & *output*) const [pure virtual]

Implements **decaf::security::cert::X509Certificate** (p. 3408).

6.501.2.7 virtual const X500Principal* decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getIssuerX500Principal () const [pure virtual]

Implements **decaf::security::cert::X509Certificate** (p. 3408).

6.501.2.8 virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getKeyUsage (std::vector< unsigned char > & *output*) const [pure virtual]

Implements **decaf::security::cert::X509Certificate** (p. 3408).

6.501.2.9 virtual Date decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getNotAfter () const [pure virtual]

Implements **decaf::security::cert::X509Certificate** (p. 3408).

6.501.2.10 virtual Date decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getNotBefore () const [pure virtual]

Implements **decaf::security::cert::X509Certificate** (p. 3408).

6.501.2.11 virtual const PublicKey* decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getPublicKey () const [pure virtual]

Gets the public key of this certificate.

Returns:

the public key

Implements **decaf::security::cert::Certificate** (p. 969).

6.501.2.12 virtual PublicKey* decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getPublicKey () [pure virtual]

Gets the public key of this certificate.

Returns:

the public key

Implements **decaf::security::cert::Certificate** (p. 969).

6.501.2.13 virtual std::string decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getSigAlgName () const [pure virtual]

Implements **decaf::security::cert::X509Certificate** (p. 3408).

6.501.2.14 virtual std::string decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getSigAlgOID () const [pure virtual]

Implements **decaf::security::cert::X509Certificate** (p. 3409).

6.501.2.15 virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getSigAlgParams (std::vector< unsigned char > & *output*) const [pure virtual]

Implements **decaf::security::cert::X509Certificate** (p. 3409).

6.501.2.16 virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getSignature (std::vector< unsigned char > & *output*) const [pure virtual]

Implements **decaf::security::cert::X509Certificate** (p. 3409).

6.501.2.17 virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getSubjectUniqueID (std::vector< bool > & *output*) const [pure virtual]

Implements **decaf::security::cert::X509Certificate** (p. 3409).

6.501.2.18 virtual const X500Principal* decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getSubjectX500Principal () const [pure virtual]

Implements **decaf::security::cert::X509Certificate** (p. 3409).

6.501.2.19 virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getTBSCertificate (std::vector< unsigned char > & *output*) const throw (CertificateEncodingException) [pure virtual]

Implements **decaf::security::cert::X509Certificate** (p. 3409).

6.501.2.20 virtual std::string decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getType () const [pure virtual]

Returns the type of this certificate.

Returns:

the type of this certificate

Implements **decaf::security::cert::Certificate** (p. 970).

6.501.2.21 virtual int decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getVersion () const [pure virtual]

Implements **decaf::security::cert::X509Certificate** (p. 3409).

6.501.2.22 virtual std::string decaf::security_provider::unix::openssl::OpenSSLX509Certificate::toString () const [pure virtual]

Returns a string representation of this certificate.

Returns:

a string representation of this certificate

Implements **decaf::security::cert::Certificate** (p. 970).

6.501.2.23 virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::verify (const PublicKey & *publicKey*, const std::string & *sigProvider*) const throw (NoSuchAlgorithmException, InvalidKeyException, NoSuchProviderException, SignatureException, CertificateException) [pure virtual]

Verifies that this certificate was signed with the private key that corresponds to the specified public key. Uses the verification engine of the specified provider.

Parameters:

publicKey The public key used to carry out the validation.

sigProvider The name of the signature provider

Exceptions:

NoSuchAlgorithmException - on unsupported signature algorithms.

InvalidKeyException - on incorrect key.

NoSuchProviderException - if there's no default provider.

SignatureException - on signature errors.

CertificateException - on encoding errors.

6.501.2.24 virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::verify (const PublicKey & *publicKey*) const throw (NoSuchAlgorithmException, InvalidKeyException, NoSuchProviderException, SignatureException, CertificateException) [pure virtual]

Verifies that this certificate was signed with the private key that corresponds to the specified public key.

Parameters:

publicKey The public key used to carry out the validation.

Exceptions:

NoSuchAlgorithmException - on unsupported signature algorithms.

InvalidKeyException - on incorrect key.

NoSuchProviderException - if there's no default provider.

SignatureException - on signature errors.

CertificateException - on encoding errors.

The documentation for this class was generated from the following file:

6.502 activemq::wireformat::openwire::OpenWireFormat Class Reference

`#include <src/main/activemq/wireformat/openwire/OpenWireFormat.h>`Inheritance diagram for activemq::wireformat::openwire::OpenWireFormat:

Public Member Functions

- **OpenWireFormat** (const **decaf::util::Properties** &properties)

  *Constructs a new **OpenWireFormat** (p. 2448) object.*

- virtual ~**OpenWireFormat** ()
- virtual bool **hasNegotiator** () const

  *Returns true if this **WireFormat** (p. 3363) has a Negotiator that needs to wrap the Transport that uses it.*

- virtual **Pointer**< **transport::Transport** > **createNegotiator** (const **Pointer**< **transport::Transport** > &transport) throw (decaf::lang::exceptions::UnsupportedOperationException)

  If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.

- void **addMarshaller** (**marshal::DataStreamMarshaller** *marshaler)

  Allows an external source to add marshalers to this object for types that may be marshaled or unmarhsaled.

- virtual void **marshal** (const **Pointer**< **commands::Command** > &command, const **activemq::transport::Transport** *transport, **decaf::io::DataOutputStream** *out) throw (decaf::io::IOException)

  Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

- virtual **Pointer**< **commands::Command** > **unmarshal** (const **activemq::transport::Transport** *transport, **decaf::io::DataInputStream** *in) throw (decaf::io::IOException)

  Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and un-marshaled into the correct form.

- virtual int **tightMarshalNestedObject1** (**commands::DataStructure** *object, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Utility method for Tight Marshaling the given object to the boolean stream passed.

- void **tightMarshalNestedObject2** (**commands::DataStructure** *o, **decaf::io::DataOutputStream** *ds, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Utility method that will Tight marshal some internally nested object that implements the DataStructure interface.

- **commands::DataStructure** * **tightUnmarshalNestedObject** (**decaf::io::DataInputStream** *dis, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Utility method used to Unmarshal a Nested DataStructure type object from the given DataInputStream.

- **commands::DataStructure** * **looseUnmarshalNestedObject** (**decaf::io::DataInputStream** *dis) throw (decaf::io::IOException)

  Utility method to unmarshal an DataStructure object from an DataInputStream using the Loose Unmarshaling format.

- void **looseMarshalNestedObject** (**commands::DataStructure** *o, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Utility method to loosely Marshal an object that is derived from the DataStrucutre interface.

- void **renegotiateWireFormat** (const **commands::WireFormatInfo** &info) throw (decaf::lang::exceptions::IllegalStateException)

  Called to re-negotiate the settings for the WireFormatInfo, these determine how the client and broker communicate.

- virtual void **setPreferedWireFormatInfo** (const **Pointer< commands::WireFormatInfo >** &info) throw (decaf::lang::exceptions::IllegalStateException)

  Configures this object using the provided WireformatInfo object.

- virtual const **Pointer< commands::WireFormatInfo >** & **getPreferedWireFormatInfo** () const

  Gets the Preferred WireFormatInfo object that this class holds.

- bool **isStackTraceEnabled** () const

  Checks if the stackTraceEnabled flag is on.

- void **setStackTraceEnabled** (bool stackTraceEnabled)

  Sets if the stackTraceEnabled flag is on.

- bool **isTcpNoDelayEnabled** () const

  Checks if the tcpNoDelayEnabled flag is on.

- void **setTcpNoDelayEnabled** (bool tcpNoDelayEnabled)

  Sets if the tcpNoDelayEnabled flag is on.

- int **getVersion** () const

  Get the current Wireformat Version.

- void **setVersion** (int version) throw (decaf::lang::exceptions::IllegalArgumentException)

  Set the current Wireformat Version.

- virtual bool **inReceive** () const

  Is there a Message being unmarshaled?

- bool **isCacheEnabled** () const

Checks if the cacheEnabled flag is on.

- void **setCacheEnabled** (bool cacheEnabled)
  Sets if the cacheEnabled flag is on.
- int **getCacheSize** () const
  Returns the currently set Cache size.
- void **setCacheSize** (int value)
  Sets the current Cache size.
- bool **isTightEncodingEnabled** () const
  Checks if the tightEncodingEnabled flag is on.
- void **setTightEncodingEnabled** (bool tightEncodingEnabled)
  Sets if the tightEncodingEnabled flag is on.
- bool **isSizePrefixDisabled** () const
  Checks if the sizePrefixDisabled flag is on.
- void **setSizePrefixDisabled** (bool sizePrefixDisabled)
  Sets if the sizePrefixDisabled flag is on.
- long long **getMaxInactivityDuration** () const
  Gets the MaxInactivityDuration setting.
- void **setMaxInactivityDuration** (long long value)
  Sets the MaxInactivityDuration setting.
- long long **getMaxInactivityDurationInitialDelay** () const
  Gets the MaxInactivityDurationInitialDelay setting.
- void **setMaxInactivityDurationInitialDelay** (long long value)
  Sets the MaxInactivityDurationInitialDelay setting.

Protected Member Functions

- **commands::DataStructure** * **doUnmarshal** (**decaf::io::DataInputStream** *dis) throw (decaf::io::IOException)
  Perform the actual unmarshal of data from the given DataInputStream return the unmarshalled DataStrucutre object once done, caller takes ownership of this object.
- void **destroyMarshalers** ()
  Cleans up all registered Marshallers and empties the dataMarshallers vector.

Static Protected Attributes

- static const unsigned char **NULL_TYPE**
- static const int **DEFAULT_VERSION** = 1

6.502.1 Constructor & Destructor Documentation

6.502.1.1 activemq::wireformat::openwire::OpenWireFormat::OpenWireFormat (const decaf::util::Properties & *properties*)

Constructs a new **OpenWireFormat** (p. 2448) object.

Parameters:

properties - can contain optional config params.

6.502.1.2 virtual activemq::wireformat::openwire::OpenWireFormat::~OpenWireFormat () [virtual]

6.502.2 Member Function Documentation

6.502.2.1 void activemq::wireformat::openwire::OpenWireFormat::addMarshaller (marshal::DataStreamMarshaller * *marshaler*)

Allows an external source to add marshalers to this object for types that may be marshaled or unmarhsaled.

Parameters:

marshaler - the Marshaler to add to the collection.

6.502.2.2 virtual Pointer<transport::Transport> activemq::wireformat::openwire::OpenWireFormat::createNegotiator (const Pointer< transport::Transport > & *transport*) throw (decaf::lang::exceptions::UnsupportedOperationException) [virtual]

If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.

Returns:

new instance of a **WireFormatNegotiator** (p. 3399).

Implements **activemq::wireformat::WireFormat** (p. 3364).

6.502.2.3 void activemq::wireformat::openwire::OpenWireFormat::destroyMarshalers () [protected]

Cleans up all registered Marshallers and empties the dataMarshallers vector. This should be called before a reconfiguration of the version marshallers, or on destruction of this object

6.502.2.4 commands::DataStructure* activemq::wireformat::openwire::OpenWireFormat::doUnmarshal (decaf::io::DataInputStream * *dis*) throw (decaf::io::IOException) [protected]

Perform the actual unmarshal of data from the given DataInputStream return the unmarshalled DataStrucutre object once done, caller takes ownership of this object. This method can return null if the type of the object to unmarshal is NULL, empty data.

Parameters:

dis - DataInputStream to read from

Returns:

new DataStructure* that the caller owns

Exceptions:

IOException if an error occurs during the unmarshal

6.502.2.5 int activemq::wireformat::openwire::OpenWireFormat::getCacheSize () const [inline]

Returns the currently set Cache size.

Returns:

the current value of the broker's cache size.

6.502.2.6 long long activemq::wireformat::openwire::OpenWireFormat::getMaxInactivityDuration () const [inline]

Gets the MaxInactivityDuration setting.

Returns:

maximum inactivity duration value in milliseconds.

6.502.2.7 long long activemq::wireformat::openwire::OpenWireFormat::getMaxInactivityDurationInitialDelay () const [inline]

Gets the MaxInactivityDurationInitialDelay setting.

Returns:

maximum inactivity duration initial delay value in milliseconds.

6.502.2.8 virtual const Pointer<commands::WireFormatInfo>& activemq::wireformat::openwire::OpenWireFormat::getPreferedWireFormatInfo () const [inline, virtual]

Gets the Preferred WireFormatInfo object that this class holds.

Returns:

pointer to a preferred WireFormatInfo object

6.502.2.9 int activemq::wireformat::openwire::OpenWireFormat::getVersion () const [inline, virtual]

Get the current Wireformat Version.

Returns:

int that identifies the version

Implements **activemq::wireformat::WireFormat** (p. 3364).

6.502.2.10 virtual bool activemq::wireformat::openwire::OpenWireFormat::hasNegotiator () const [inline, virtual]

Returns true if this **WireFormat** (p. 3363) has a Negotiator that needs to wrap the Transport that uses it.

Returns:

true if the **WireFormat** (p. 3363) provides a Negotiator.

Implements **activemq::wireformat::WireFormat** (p. 3364).

6.502.2.11 virtual bool activemq::wireformat::openwire::OpenWireFormat::inReceive () const [inline, virtual]

Is there a Message being unmarshaled?

Returns:

true while in the doUnmarshal method.

Implements **activemq::wireformat::WireFormat** (p. 3365).

6.502.2.12 bool activemq::wireformat::openwire::OpenWireFormat::isCacheEnabled () const [inline]

Checks if the cacheEnabled flag is on.

Returns:

true if the flag is on.

6.502.2.13 bool activemq::wireformat::openwire::OpenWireFormat::isSizePrefixDisabled () const [inline]

Checks if the sizePrefixDisabled flag is on.

Returns:

true if the flag is on.

6.502.2.14 bool activemq::wireformat::openwire::OpenWireFormat::isStackTraceEnabled () const [inline]

Checks if the stackTraceEnabled flag is on.

Returns:

true if the flag is on.

6.502.2.15 bool activemq::wireformat::openwire::OpenWireFormat::isTcpNoDelayEnabled () const [inline]

Checks if the tcpNoDelayEnabled flag is on.

Returns:

true if the flag is on.

6.502.2.16 bool activemq::wireformat::openwire::OpenWireFormat::isTightEncodingEnabled () const [inline]

Checks if the tightEncodingEnabled flag is on.

Returns:

true if the flag is on.

6.502.2.17 void activemq::wireformat::openwire::OpenWireFormat::looseMarshalNestedObject (commands::DataStructure * *o*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException)

Utility method to loosely Marshal an object that is derived from the DataStrucutre interface. The marshaled data is written to the passed in DataOutputStream.

Parameters:

o - DataStructure derived Object to Marshal

dataOut - DataOutputStream to write the data to

Exceptions:

IOException if an error occurs.

6.502.2.18 commands::DataStructure* activemq::wireformat::openwire::OpenWireFormat::looseUnmarshalNestedObject (decaf::io::DataInputStream * *dis*) throw (decaf::io::IOException)

Utility method to unmarshal an DataStructure object from an DataInputStream using the Loose Unmarshaling format. Will read the Data and construct a new DataStructure based Object, the pointer to the Object returned is now owned by the caller.

Parameters:

dis - the DataInputStream to read the data from

Returns:

a new DataStructure derived Object pointer

Exceptions:

IOException if an error occurs.

6.502.2.19 virtual void activemq::wireformat::openwire::OpenWireFormat::marshal (const Pointer< commands::Command > & *command*, const activemq::transport::Transport * *transport*, decaf::io::DataOutputStream * *out*) throw (decaf::io::IOException) [virtual]

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

Parameters:

command The Command to Marshal.

transport The Transport instance that called this method.

out The output stream to write the command to.

Exceptions:

IOException

Implements **activemq::wireformat::WireFormat** (p. 3365).

6.502.2.20 void activemq::wireformat::openwire::OpenWireFormat::renegotiateWireFormat (const commands::WireFormatInfo & *info*) throw (decaf::lang::exceptions::IllegalStateException)

Called to re-negotiate the settings for the WireFormatInfo, these determine how the client and broker communicate.

Parameters:

info - The new Wireformat Info settings

Exceptions:

IllegalStateException is wire format can't be negotiated.

6.502.2.21 void activemq::wireformat::openwire::OpenWireFormat::setCacheEnabled (bool *cacheEnabled*) [inline]

Sets if the cacheEnabled flag is on.

Parameters:

cacheEnabled - true to turn flag is on

6.502.2.22 void activemq::wireformat::openwire::OpenWireFormat::setCacheSize (int *value*) [inline]

Sets the current Cache size.

Parameters:

value - the value to send as the broker's cache size.

6.502.2.23 void activemq::wireformat::openwire::OpenWireFormat::setMaxInactivityDuration (long long *value*) [inline]

Sets the MaxInactivityDuration setting.

Parameters:

value - the Max inactivity duration value in milliseconds.

6.502.2.24 void activemq::wireformat::openwire::OpenWireFormat::setMaxInactivityDurationInitialDelay (long long *value*) [inline]

Sets the MaxInactivityDurationInitialDelay setting.

Parameters:

value - the Max inactivity Initial Delay duration value in milliseconds.

6.502.2.25 virtual void activemq::wireformat::openwire::OpenWireFormat::setPreferedWireFormatInfo (const Pointer< commands::WireFormatInfo > & *info*) throw (decaf::lang::exceptions::IllegalStateException) [virtual]

Configures this object using the provided WireformatInfo object.

Parameters:

info - a WireFormatInfo object, takes ownership.

6.502.2.26 void activemq::wireformat::openwire::OpenWireFormat::setSizePrefixDisabled (bool *sizePrefixDisabled*) [inline]

Sets if the sizePrefixDisabled flag is on.

Parameters:

sizePrefixDisabled - true to turn flag is on

6.502.2.27 void activemq::wireformat::openwire::OpenWireFormat::setStackTraceEnabled (bool *stackTraceEnabled*) [inline]

Sets if the stackTraceEnabled flag is on.

Parameters:

stackTraceEnabled - true to turn flag is on

6.502.2.28 void activemq::wireformat::openwire::OpenWireFormat::setTcpNoDelayEnabled (bool *tcpNoDelayEnabled*) [inline]

Sets if the tcpNoDelayEnabled flag is on.

Parameters:

tcpNoDelayEnabled - true to turn flag is on

6.502.2.29 void activemq::wireformat::openwire::OpenWireFormat::setTightEncodingEnabled (bool *tightEncodingEnabled*) [inline]

Sets if the tightEncodingEnabled flag is on.

Parameters:

tightEncodingEnabled - true to turn flag is on

6.502.2.30 void activemq::wireformat::openwire::OpenWireFormat::setVersion (int *version*) throw (decaf::lang::exceptions::IllegalArgumentException) [virtual]

Set the current Wireformat Version.

Parameters:

version - int that identifies the version

Implements **activemq::wireformat::WireFormat** (p. 3365).

6.502.2.31 virtual int activemq::wireformat::openwire::OpenWireFormat::tightMarshalNestedObject1 (commands::DataStructure * *object*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Utility method for Tight Marshaling the given object to the boolean stream passed.

Parameters:

object - The DataStructure to marshal

bs - the BooleanStream to write to

Returns:

size of the data returned.

6.502.2.32 void activemq::wireformat::openwire::OpenWireFormat::tightMarshalNestedObject2 (commands::DataStructure * *o*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) throw (decaf::io::IOException)

Utility method that will Tight marshal some internally nested object that implements the DataStructure interface. Writes the data to the Data Output Stream provided.

Parameters:

o - DataStructure object

ds - DataOuputStream for writing

bs - BooleanStream

Exceptions:

IOException if an error occurs.

6.502.2.33 commands::DataStructure* activemq::wireformat::openwire::OpenWireFormat::tightUnmarshalNestedObject (decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) throw (decaf::io::IOException)

Utility method used to Unmarshal a Nested DataStructure type object from the given DataInputStream. The DataStructure instance that is returned is now the property of the caller.

Parameters:

dis - DataInputStream to read from

bs - BooleanStream to read from

Returns:

Newly allocated DataStructure Object

Exceptions:

IOException if an error occurs.

6.502.2.34 virtual Pointer<commands::Command> activemq::wireformat::openwire::OpenWireFormat::unmarshal (const activemq::transport::Transport * *transport*, decaf::io::DataInputStream * *in*) throw (decaf::io::IOException) [virtual]

Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and un-marshaled into the correct form. Returns a Pointer to the newly un-marshaled Command.

Parameters:

transport - Pointer to the transport that is making this request.

in - the input stream to read the command from.

Returns:

the newly marshaled Command, caller owns the pointer

Exceptions:

IOException

Implements **activemq::wireformat::WireFormat** (p. 3366).

6.502.3 Field Documentation

6.502.3.1 const int activemq::wireformat::openwire::OpenWireFormat::DEFAULT_VERSION = 1 [static, protected]

6.504 activemq::wireformat::openwire::OpenWireFormatNegotiator Class Reference

`#include <src/main/activemq/wireformat/openwire/OpenWireFormatNegotiator.h>`Inheritance diagram for activemq::wireformat::openwire::OpenWireFormatNegotiator:

Public Member Functions

- **OpenWireFormatNegotiator** (**OpenWireFormat** *wireFormat, const **Pointer< transport::Transport >** &**next**)

  Constructor - Initializes this object around another Transport.

- virtual ~**OpenWireFormatNegotiator** ()
- virtual void **oneway** (const **Pointer< commands::Command >** &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

  Sends a one-way command.

- virtual **Pointer< commands::Response >** **request** (const **Pointer< commands::Command >** &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

  Sends the given request to the server and waits for the response.

- virtual **Pointer< commands::Response >** **request** (const **Pointer< commands::Command >** &command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

  Sends the given request to the server and waits for the response.

- virtual void **onCommand** (const **Pointer< commands::Command >** &command)

  This is called in the context of the nested transport's reading thread.

- virtual void **onTransportException** (**transport::Transport** *source, const **decaf::lang::Exception** &ex)

  Event handler for an exception from a command transport.

- virtual void **start** () throw (decaf::io::IOException)

  Starts this transport object and creates the thread for polling on the input stream for commands.

- virtual void **close** () throw (decaf::io::IOException)

  Stops the polling thread and closes the streams.

6.504.1 Constructor & Destructor Documentation

6.504.1.1 activemq::wireformat::openwire::OpenWireFormatNegotiator::OpenWireFormatNegotiator (OpenWireFormat * *wireFormat*, const Pointer< transport::Transport > & *next*)

Constructor - Initializes this object around another Transport.

Parameters:

wireFormat - The **WireFormat** (p. 3363) object we use to negotiate

next - The next transport in the chain

6.504.1.2 virtual activemq::wireformat::openwire::OpenWireFormatNegotiator::~OpenWireFormatNegotiat () [virtual]

6.504.2 Member Function Documentation

6.504.2.1 virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::close () throw (decaf::io::IOException) [virtual]

Stops the polling thread and closes the streams. This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

Exceptions:

IOException if errors occur.

Reimplemented from **activemq::transport::TransportFilter** (p. 3283).

6.504.2.2 virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::onCommand (const Pointer< commands::Command > & *command*) [virtual]

This is called in the context of the nested transport's reading thread. In the case of a response object, updates the request map and notifies those waiting on the response. Non-response messages are just delegated to the command listener.

Parameters:

command the received from the nested transport.

Reimplemented from **activemq::transport::TransportFilter** (p. 3285).

6.504.2.3 virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::oneway (const Pointer< commands::Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends a one-way command. Does not wait for any response from the broker. First waits for the WireFormatInfo exchange to happen so that we know how to encode out-bound data.

Parameters:

command the command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Reimplemented from **activemq::transport::TransportFilter** (p. 3285).

6.504.2.4 virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::onTransportException (transport::Transport * *source*, const decaf::lang::Exception & *ex*) [virtual]

Event handler for an exception from a command transport.

Parameters:

source The source of the exception

ex The exception.

6.504.2.5 virtual Pointer<commands::Response> activemq::wireformat::openwire::OpenWireFormatNegotiator::request (const Pointer< commands::Command > & *command*, unsigned int *timeout*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends the given request to the server and waits for the response. First waits for the WireFormatInfo exchange to happen so that we know how to encode out-bound data.

Parameters:

command The request to send.

timeout The time to wait for the response.

Returns:

the response from the server.

Exceptions:

IOException if an error occurs with the request.

Reimplemented from **activemq::transport::TransportFilter** (p. 3286).

6.504.2.6 virtual Pointer<commands::Response> activemq::wireformat::openwire::OpenWireFormatNegotiator::request (const Pointer< commands::Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends the given request to the server and waits for the response. First waits for the WireFormatInfo exchange to happen so that we know how to encode out-bound data.

Parameters:

command The request to send.

Returns:

the response from the server.

Exceptions:

IOException if an error occurs with the request.

Reimplemented from **activemq::transport::TransportFilter** (p. 3287).

6.504.2.7 virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::start () throw (decaf::io::IOException) [virtual]

Starts this transport object and creates the thread for polling on the input stream for commands. If this object has been closed, throws an exception. Before calling start, the caller must set the IO streams and the reader and writer objects.

Exceptions:

IOException if an error occurs or if this transport has already been closed.

Reimplemented from **activemq::transport::TransportFilter** (p. 3287).

The documentation for this class was generated from the following file:

6.505 activemq::wireformat::openwire::OpenWireResponseBuilder Class Reference

`#include <src/main/activemq/wireformat/openwire/OpenWireResponseBuilder.h>`Inheritance diagram for activemq::wireformat::openwire::OpenWireResponseBuilder:

Public Member Functions

- **OpenWireResponseBuilder** ()
- virtual ~**OpenWireResponseBuilder** ()
- virtual **Pointer< commands::Response > buildResponse** (const **Pointer< commands::Command >** &command)

  Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.

- virtual void **buildIncomingCommands** (const **Pointer< commands::Command >** &command, **decaf::util::StlQueue< Pointer< commands::Command > >** &queue)

  When called the ResponseBuilder must construct all the Responses or Asynchronous commands that would be sent to this client by the Broker upon receipt of the passed command.

6.505.1 Constructor & Destructor Documentation

6.505.1.1 activemq::wireformat::openwire::OpenWireResponseBuilder::OpenWireResponseBuilder () [inline]

6.505.1.2 virtual activemq::wireformat::openwire::OpenWireResponseBuilder::~OpenWireResponseBuilder () [inline, virtual]

6.505.2 Member Function Documentation

6.505.2.1 virtual void activemq::wireformat::openwire::OpenWireResponseBuilder::buildIncomingCommands (const Pointer< commands::Command > & *command*, decaf::util::StlQueue< Pointer< commands::Command > > & *queue*) [virtual]

When called the ResponseBuilder must construct all the Responses or Asynchronous commands that would be sent to this client by the Broker upon receipt of the passed command.

Parameters:

command - The Command being sent to the Broker.

queue - Queue of Command sent back from the broker.

Implements **activemq::transport::mock::ResponseBuilder** (p. 2785).

6.505.2.2 virtual Pointer<commands::Response> activemq::wireformat::openwire::OpenWireResponseBuilder::buildResponse (const Pointer< commands::Command > & *command*) [virtual]

Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.

Parameters:

command - The command to build a response for

Returns:

A Response object pointer, or NULL if no response.

Implements **activemq::transport::mock::ResponseBuilder** (p. 2786).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/**OpenWireResponseBuilder.h**

6.506 activemq::wireformat::openwire::utils::OpenwireStringSupport Class Reference

`#include <src/main/activemq/wireformat/openwire/utils/OpenwireStringSupport.h>`

Static Public Member Functions

- static std::string **readString** (**decaf::io::DataInputStream** &dataIn) throw (decaf::io::IOException)

  Static method used for reading a string that uses the Openwire format from a DataInputStream, this can throw an IOException for the same reason as a DataInputStream.readUTF might, as well as if the string that is received doesn't conform to the supported character encoding.

- static void **writeString** (**decaf::io::DataOutputStream** &dataOut, const std::string *str) throw (decaf::io::IOException)

  Static method used for writing a string that uses the Openwire format from a DataOutputStream, this can throw an IOException for the same reason as a DataOutputStream.writeUTF might.

Protected Member Functions

- **OpenwireStringSupport** ()
- virtual ~**OpenwireStringSupport** ()

6.506.1 Constructor & Destructor Documentation

6.506.1.1 activemq::wireformat::openwire::utils::OpenwireStringSupport::OpenwireStringSupport () [inline, protected]

6.506.1.2 virtual activemq::wireformat::openwire::utils::OpenwireStringSupport::~OpenwireStringSupport () [inline, protected, virtual]

6.506.2 Member Function Documentation

6.506.2.1 static std::string activemq::wireformat::openwire::utils::OpenwireStringSupport::readString (decaf::io::DataInputStream & *dataIn*) throw (decaf::io::IOException) [static]

Static method used for reading a string that uses the Openwire format from a DataInputStream, this can throw an IOException for the same reason as a DataInputStream.readUTF might, as well as if the string that is received doesn't conform to the supported character encoding.

Parameters:

dataIn - DataInputStream to read from

Returns:

A string that has been read

Exceptions:

IOException on Error.

6.506.2.2 static void activemq::wireformat::openwire::utils::OpenwireStringSupport::writeString (decaf::io::DataOutputStream & *dataOut*, const std::string * *str*) throw (decaf::io::IOException) [static]

Static method used for writing a string that uses the Openwire format from a DataOutputStream, this can throw an IOException for the same reason as a DataOutputStream.writeUTF might.

Parameters:

dataOut - DataOutputStream to write to

str - A pointer to a string that should be written, NULL needs to be an option here as its written as -1.

Exceptions:

IOException on Error.

- src/main/activemq/wireformat/openwire/utils/**OpenwireStringSupport.h**

6.507 decaf::io::OutputStream Class Reference

Base interface for an output stream.

`#include <src/main/decaf/io/OutputStream.h>`Inheritance diagram for decaf::io::OutputStream:

Public Member Functions

- virtual ~**OutputStream** ()
- virtual void **write** (unsigned char c)=0 throw (IOException)

  Writes a single byte to the output stream.

- virtual void **write** (const std::vector< unsigned char > &buffer)=0 throw (IOException)

  Writes an array of bytes to the output stream.

- virtual void **write** (const unsigned char *buffer, std::size_t offset, std::size_t len)=0 throw (IOException, lang::exceptions::NullPointerException)

  Writes an array of bytes to the output stream.

- virtual void **flush** ()=0 throw (IOException)

  Flushes any pending writes in this output stream.

6.507.1 Detailed Description

Base interface for an output stream.

6.507.2 Constructor & Destructor Documentation

6.507.2.1 virtual decaf::io::OutputStream::~OutputStream () `[inline, virtual]`

6.507.3 Member Function Documentation

6.507.3.1 virtual void decaf::io::OutputStream::flush () throw (IOException) `[pure virtual]`

Flushes any pending writes in this output stream.

Exceptions:

IOException *(*p. ***1820****)*

Implemented in **decaf::internal::io::StandardErrorOutputStream** (p. 2995), **decaf::internal::io::StandardOutputStream** (p. 3009), **decaf::io::BufferedOutputStream** (p. 815), **decaf::io::ByteArrayOutputStream** (p. 902), **decaf::io::FilterOutputStream** (p. 1642), and **decaf::net::SocketOutputStream** (p. 2985).

6.507.3.2 virtual void decaf::io::OutputStream::write (const unsigned char * *buffer*, std::size_t *offset*, std::size_t *len*) throw (IOException, lang::exceptions::NullPointerException) [pure virtual]

Writes an array of bytes to the output stream.

Parameters:

buffer The array of bytes to write.

offset the position to start writing in buffer.

len The number of bytes from the buffer to be written.

Exceptions:

IOException *(p. 1820)* thrown if an error occurs.

NullPointerException thrown if buffer is Null.

Implemented in **activemq::io::LoggingOutputStream** (p. 2040), **decaf::internal::io::StandardErrorOutputStream** (p. 2998), **decaf::internal::io::StandardOutputStream** (p. 3012), **decaf::io::BufferedOutputStream** (p. 815), **decaf::io::ByteArrayOutputStream** (p. 906), **decaf::io::DataOutputStream** (p. 1390), **decaf::io::FilterOutputStream** (p. 1645), and **decaf::net::SocketOutputStream** (p. 2988).

6.507.3.3 virtual void decaf::io::OutputStream::write (const std::vector< unsigned char > & *buffer*) throw (IOException) [pure virtual]

Writes an array of bytes to the output stream.

Parameters:

buffer The bytes to write.

Exceptions:

IOException *(p. 1820)* thrown if an error occurs.

Implemented in **decaf::internal::io::StandardErrorOutputStream** (p. 2999), **decaf::internal::io::StandardOutputStream** (p. 3012), **decaf::io::BufferedOutputStream** (p. 816), **decaf::io::ByteArrayOutputStream** (p. 906), **decaf::io::DataOutputStream** (p. 1390), **decaf::io::FilterOutputStream** (p. 1646), and **decaf::net::SocketOutputStream** (p. 2989).

6.507.3.4 virtual void decaf::io::OutputStream::write (unsigned char *c*) throw (IOException) [pure virtual]

Writes a single byte to the output stream.

Parameters:

c the byte.

Exceptions:

IOException *(p. 1820)* thrown if an error occurs.

Implemented in **activemq::io::LoggingOutputStream** (p. 2041), **decaf::internal::io::StandardErrorOutputStream** (p. 2999), **decaf::internal::io::StandardOutputStream** (p. 3013), **decaf::io::BufferedOutputStream** (p. 816), **decaf::io::ByteArrayOutputStream** (p. 907), **decaf::io::DataOutputStream** (p. 1390), **decaf::io::FilterOutputStream** (p. 1646), and **decaf::net::SocketOutputStream** (p. 2989).

The documentation for this class was generated from the following file:

- std::vector< unsigned char > **data**

6.508.1 Constructor & Destructor Documentation

6.508.1.1 activemq::commands::PartialCommand::PartialCommand (const PartialCommand &) [inline, protected]

6.508.1.2 activemq::commands::PartialCommand::PartialCommand ()

6.508.1.3 virtual activemq::commands::PartialCommand::~PartialCommand () [virtual]

6.508.2 Member Function Documentation

6.508.2.1 virtual PartialCommand* activemq::commands::PartialCommand::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 1959).

6.508.2.2 virtual void activemq::commands::PartialCommand::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Implements **activemq::commands::DataStructure** (p. 1462).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 1959).

6.508.2.3 virtual bool activemq::commands::PartialCommand::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1463).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 1959).

6.508.2.4 virtual int activemq::commands::PartialCommand::getCommandId () const [virtual]

6.508.2.5 virtual std::vector<unsigned char>& activemq::commands::PartialCommand::getData () [virtual]

6.508.2.7 virtual unsigned char activemq::commands::PartialCommand::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 1960).

6.508.2.8 PartialCommand& activemq::commands::PartialCommand::operator= (const PartialCommand &) [inline, protected]

6.508.2.9 virtual void activemq::commands::PartialCommand::setCommandId (int *commandId*) [virtual]

6.508.2.10 virtual void activemq::commands::PartialCommand::setData (const std::vector< unsigned char > & *data*) [virtual]

6.508.2.11 virtual std::string activemq::commands::PartialCommand::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 718).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 1960).

6.508.3 Field Documentation

6.508.3.1 int activemq::commands::PartialCommand::commandId [protected]

6.508.3.2 std::vector<unsigned char> activemq::commands::PartialCommand::data [protected]

6.508.3.3 const unsigned char activemq::commands::PartialCommand::ID_PARTIALCOMMAND = 60 [static]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**PartialCommand.h**

6.509 activemq::wireformat::openwire::marshal::v2::PartialCommandMa Class Reference

Marshaling code for Open Wire Format for **PartialCommandMarshaller** (p. 2477).

`#include <src/main/activemq/wireformat/openwire/marshal/v2/PartialCommandMarshaller.h>`Inheritance diagram for activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller:

Public Member Functions

- **PartialCommandMarshaller** ()
- virtual ~**PartialCommandMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.509.1 Detailed Description

Marshaling code for Open Wire Format for **PartialCommandMarshaller** (p. 2477). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.509.2 Constructor & Destructor Documentation

6.509.2.1 activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::PartialCommar () [inline]

6.509.2.2 virtual activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::~PartialComma () [inline, virtual]

6.509.3 Member Function Documentation

6.509.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 1962).

6.509.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::getDataStructure () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 1962).

6.509.3.3 virtual void activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 1962).

6.509.3.4 virtual void activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 1963).

6.509.3.5 virtual int activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 1963).

6.509.3.6 virtual void activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 1964).

6.509.3.7 virtual void activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 1964).

6.510.3 Member Function Documentation

6.510.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller** (p. 1970).

6.510.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::getDataStructure () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller** (p. 1970).

6.510.3.3 virtual void activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller** (p. 1970).

6.510.3.4 virtual void activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller** (p. 1971).

6.510.3.5 virtual int activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller** (p. 1971).

6.510.3.6 virtual void activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller** (p. 1972).

6.510.3.7 virtual void activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller** (p. 1972).

The documentation for this class was generated from the following file:

6.511.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller** (p. 1974).

6.511.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::getDataStructure () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller** (p. 1974).

6.511.3.3 virtual void activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller** (p. 1974).

6.511.3.4 virtual void activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller** (p. 1975).

6.511.3.5 virtual int activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller** (p. 1975).

6.511.3.6 virtual void activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller** (p. 1976).

6.511.3.7 virtual void activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v5/**PartialCommandMarshaller.h**

6.514 decaf::lang::Pointer< T, REFCOUNTER > Class Template Reference

Decaf's implementation of a Smart **Pointer** (p. 2497) that is a template on a Type and is Thread Safe if the default Reference Counter is used.

`#include <src/main/decaf/lang/Pointer.h>`

Public Types

- typedef T * **PointerType**
- typedef T & **ReferenceType**
- typedef REFCOUNTER **CounterType**

Public Member Functions

- **Pointer** ()

  Default Constructor.

- **Pointer** (const **PointerType** value)

  *Explicit Constructor, creates a **Pointer** (p. 2497) that contains value with a single reference.*

- **Pointer** (const **Pointer** &value) throw ()

  Copy constructor.

- template<typename T1 , typename R1 >
  Pointer (const **Pointer**< T1, R1 > &value) throw ()

  Copy constructor.

- template<typename T1 , typename R1 >
  Pointer (const **Pointer**< T1, R1 > &value, const **STATIC_CAST_TOKEN** &) throw ()

  Static Cast constructor.

- template<typename T1 , typename R1 >
  Pointer (const **Pointer**< T1, R1 > &value, const **DYNAMIC_CAST_TOKEN** &) throw (decaf::lang::exceptions::ClassCastException)

  Dynamic Cast constructor.

- virtual ~**Pointer** () throw ()
- void **reset** (T *value)

  *Resets the **Pointer** (p. 2497) to hold the new value.*

- T * **release** ()

  *Releases the **Pointer** (p. 2497) held and resets the internal pointer value to Null.*

- **PointerType get** () const

  *Gets the real pointer that is contained within this **Pointer** (p. 2497).*

- void **swap** (**Pointer** &value) throw ()

Exception *(p. 1574) Safe Swap Function.*

- **Pointer** & **operator**= (const **Pointer** &right) throw ()

  Assigns the value of right to this ***Pointer*** *(p. 2497) and increments the reference Count.*

- template<typename T1 , typename R1 >
  Pointer & **operator**= (const **Pointer**< T1, R1 > &right) throw ()
- **ReferenceType operator*** ()

  Dereference Operator, returns a reference to the Contained value.

- **ReferenceType operator*** () const
- **PointerType operator->** ()

  Indirection Operator, returns a pointer to the Contained value.

- **PointerType operator->** () const
- bool **operator!** () const
- template<typename T1 , typename R1 >
  bool **operator==** (const **Pointer**< T1, R1 > &right) const
- template<typename T1 , typename R1 >

6.514.1 Detailed Description

template<typename T, typename REFCOUNTER = AtomicRefCounter> class decaf::lang::Pointer< T, REFCOUNTER >

Decaf's implementation of a Smart **Pointer** (p. 2497) that is a template on a Type and is Thread Safe if the default Reference Counter is used. This **Pointer** (p. 2497) type allows for the substitution of different Reference Counter implementations which provide a means of using invasive reference counting if desired using a custom implementation of `ReferenceCounter`.

The Decaf smart pointer provide comparison operators for comparing **Pointer** (p. 2497) instances in the same manner as normal pointer, except that it does not provide an overload of operators (<, <=, >, >=). To allow use of a **Pointer** (p. 2497) in a STL container that requires it, **Pointer** (p. 2497) provides an implementation of std::less.

Since:

1.0

6.514.2 Member Typedef Documentation

6.514.2.1 template<typename T, typename REFCOUNTER = AtomicRefCounter> typedef REFCOUNTER decaf::lang::Pointer< T, REFCOUNTER >::CounterType

6.514.2.2 template<typename T, typename REFCOUNTER = AtomicRefCounter> typedef T* decaf::lang::Pointer< T, REFCOUNTER >::PointerType

6.514.2.3 template<typename T, typename REFCOUNTER = AtomicRefCounter> typedef T& decaf::lang::Pointer< T, REFCOUNTER >::ReferenceType

6.514.3 Constructor & Destructor Documentation

6.514.3.1 template<typename T, typename REFCOUNTER = AtomicRefCounter> decaf::lang::Pointer< T, REFCOUNTER >::Pointer () [inline]

Default Constructor. Initialized the contained pointer to NULL, using the -> operator results in an exception unless reset to contain a real value.

Referenced by decaf::lang::Pointer< TransactionId >::reset().

6.514.3.2 template<typename T, typename REFCOUNTER = AtomicRefCounter> decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const PointerType *value*) [inline, explicit]

Explicit Constructor, creates a **Pointer** (p. 2497) that contains value with a single reference. This object now has ownership until a call to release.

Parameters:

value - instance of the type we are containing here.

6.514.3.3 template<typename T, typename REFCOUNTER = AtomicRefCounter> decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const Pointer< T, REFCOUNTER > & *value*) throw () [inline]

Copy constructor. Copies the value contained in the pointer to the new instance and increments the reference counter.

6.514.3.4 template<typename T, typename REFCOUNTER = AtomicRefCounter> template<typename T1 , typename R1 > decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const Pointer< T1, R1 > & *value*) throw () [inline]

Copy constructor. Copies the value contained in the pointer to the new instance and increments the reference counter.

6.514.3.5 template<typename T, typename REFCOUNTER = AtomicRefCounter> template<typename T1 , typename R1 > decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const Pointer< T1, R1 > & *value*, const STATIC_CAST_TOKEN &) throw () [inline]

Static Cast constructor. Copies the value contained in the pointer to the new instance and increments the reference counter performing a static cast on the value contained in the source **Pointer** (p. 2497) object.

Parameters:

value - **Pointer** (p. 2497) instance to cast to this type.

6.514.3.6 template<typename T, typename REFCOUNTER = AtomicRefCounter> template<typename T1 , typename R1 > decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const Pointer< T1, R1 > & *value*, const DYNAMIC_CAST_TOKEN &) throw (decaf::lang::exceptions::ClassCastException) [inline]

Dynamic Cast constructor. Copies the value contained in the pointer to the new instance and increments the reference counter performing a dynamic cast on the value contained in the source **Pointer** (p. 2497) object. If the cast fails and return NULL then this method throws a ClassCastException.

Parameters:

value - **Pointer** (p. 2497) instance to cast to this type.

Exceptions:

ClassCastException if the dynamic cast returns NULL

6.514.3.7 template<typename T, typename REFCOUNTER = AtomicRefCounter> virtual decaf::lang::Pointer< T, REFCOUNTER >::~Pointer () throw () [inline, virtual]

6.514.4 Member Function Documentation

6.514.4.1 template<typename T, typename REFCOUNTER = AtomicRefCounter> template<typename T1 > Pointer<T1, CounterType> decaf::lang::Pointer< T, REFCOUNTER >::dynamicCast () const [inline]

6.514.4.2 template<typename T, typename REFCOUNTER = AtomicRefCounter> PointerType decaf::lang::Pointer< T, REFCOUNTER >::get () const [inline]

Gets the real pointer that is contained within this **Pointer** (p. 2497). This is not really safe since the caller could delete or alter the pointer but it mimics the STL auto_ptr and gives access in cases where the caller absolutely needs the real **Pointer** (p. 2497). Use at your own risk.

Returns:

the contained pointer.

Referenced by activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::equals(), activemq::core::ActiveMQConnectionSupport::getProperties(), activemq::core::ActiveMQConnectionSupport::getTransport(), decaf::lang::operator!=(), decaf::lang::Pointer< TransactionId >::operator!=(), std::less< decaf::lang::Pointer< T > >::operator()(), decaf::lang::operator==(), decaf::lang::Pointer< TransactionId >::operator==(), and activemq::state::ConnectionState::removeTempDestination().

6.514.4.3 template<typename T, typename REFCOUNTER = AtomicRefCounter> bool decaf::lang::Pointer< T, REFCOUNTER >::operator! () const [inline]

6.514.4.4 template<typename T, typename REFCOUNTER = AtomicRefCounter> template<typename T1 , typename R1 > bool decaf::lang::Pointer< T, REFCOUNTER >::operator!= (const Pointer< T1, R1 > & *right*) const [inline]

6.514.4.5 template<typename T, typename REFCOUNTER = AtomicRefCounter> ReferenceType decaf::lang::Pointer< T, REFCOUNTER >::operator* () const [inline]

6.514.4.6 template<typename T, typename REFCOUNTER = AtomicRefCounter> ReferenceType decaf::lang::Pointer< T, REFCOUNTER >::operator* () [inline]

Dereference Operator, returns a reference to the Contained value. This method throws an NullPointerException if the contained value is NULL.

Returns:

reference to the contained pointer.

Exceptions:

NullPointerException if the contained value is Null

6.514.4.7 template<typename T, typename REFCOUNTER = AtomicRefCounter> PointerType decaf::lang::Pointer< T, REFCOUNTER >::operator-> () const [inline]

6.514.4.8 template<typename T, typename REFCOUNTER = AtomicRefCounter> PointerType decaf::lang::Pointer< T, REFCOUNTER >::operator-> () [inline]

Indirection Operator, returns a pointer to the Contained value. This method throws an NullPointerException if the contained value is NULL.

Returns:

reference to the contained pointer.

Exceptions:

NullPointerException if the contained value is Null

6.514.4.9 template<typename T, typename REFCOUNTER = AtomicRefCounter> template<typename T1 , typename R1 > Pointer& decaf::lang::Pointer< T, REFCOUNTER >::operator= (const Pointer< T1, R1 > & *right*) throw () [inline]

6.514.4.10 template<typename T, typename REFCOUNTER = AtomicRefCounter> Pointer& decaf::lang::Pointer< T, REFCOUNTER >::operator= (const Pointer< T, REFCOUNTER > & *right*) throw () [inline]

Assigns the value of right to this **Pointer** (p. 2497) and increments the reference Count.

Parameters:

right - **Pointer** (p. 2497) on the right hand side of an operator= call to this.

6.514.4.11 template<typename T, typename REFCOUNTER = AtomicRefCounter> template<typename T1 , typename R1 > bool decaf::lang::Pointer< T, REFCOUNTER >::operator== (const Pointer< T1, R1 > & *right*) const [inline]

6.514.4.12 template<typename T, typename REFCOUNTER = AtomicRefCounter> T* decaf::lang::Pointer< T, REFCOUNTER >::release () [inline]

Releases the **Pointer** (p. 2497) held and resets the internal pointer value to Null. This method is not guaranteed to be safe if the **Pointer** (p. 2497) is held by more than one object or this method is called from more than one thread.

Parameters:

value - The new value to contain.

Returns:

The pointer instance that was held by this **Pointer** (p. 2497) object, the pointer is no longer owned by this **Pointer** (p. 2497) and won't be freed when this **Pointer** (p. 2497) goes out of scope.

Referenced by decaf::lang::Pointer< TransactionId >::Pointer().

6.514.4.13 template<typename T, typename REFCOUNTER = AtomicRefCounter> void decaf::lang::Pointer< T, REFCOUNTER >::reset (T * *value*) [inline]

Resets the **Pointer** (p. 2497) to hold the new value. Before the new value is stored reset checks if the old value should be destroyed and if so calls delete. Call reset with a value of NULL is supported and acts to set this **Pointer** (p. 2497) to a NULL pointer.

Parameters:

value - The new value to contain.

6.514.4.14 template<typename T, typename REFCOUNTER = AtomicRefCounter> template<typename T1 > Pointer<T1, CounterType> decaf::lang::Pointer< T, REFCOUNTER >::staticCast () const [inline]

6.514.4.15 template<typename T, typename REFCOUNTER = AtomicRefCounter> void decaf::lang::Pointer< T, REFCOUNTER >::swap (Pointer< T, REFCOUNTER > & *value*) throw () [inline]

Exception (p. 1574) Safe Swap Function.

Parameters:

value - the value to swap with this.

Referenced by decaf::lang::Pointer< TransactionId >::operator=(), and decaf::lang::Pointer< TransactionId >::swap().

6.515 decaf::lang::PointerComparator< T, R > Class Template Reference

This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the Object being Pointed to and not the value of the contained pointer in the **Pointer** (p. 2497) instance.

`#include <src/main/decaf/lang/Pointer.h>`Inheritance diagram for decaf::lang::PointerComparator< T, R >:

Public Member Functions

- virtual bool **operator()** (const **Pointer**< T, R > &left, const **Pointer**< T, R > &right) const
- virtual int **compare** (const **Pointer**< T, R > &left, const **Pointer**< T, R > &right) const

6.515.1 Detailed Description

template<typename T, typename R = AtomicRefCounter> class decaf::lang::PointerComparator< T, R >

This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the Object being Pointed to and not the value of the contained pointer in the **Pointer** (p. 2497) instance. This can be useful in the case where a series of values in a Collection is more efficiently accessed in the Objects Natural Order and not the underlying pointers location in memory.

Also this allows **Pointer** (p. 2497) objects that Point to different instances of the same type to be compared based on the comparison of the object itself and not just the value of the pointer.

6.515.2 Member Function Documentation

6.515.2.1 template<typename T , typename R = AtomicRefCounter> virtual int decaf::lang::PointerComparator< T, R >::compare (const Pointer< T, R > & *left*, const Pointer< T, R > & *right*) const [inline, virtual]

6.516 activemq::cmsutil::PooledSession Class Reference

A pooled session object that wraps around a delegate session.

`#include <src/main/activemq/cmsutil/PooledSession.h>`Inheritance diagram for activemq::cmsutil::PooledSession:

Public Member Functions

- **PooledSession** (**SessionPool** *pool, **cms::Session** *session)
- virtual ~**PooledSession** ()

  Does nothing.

- virtual **cms::Session** * **getSession** ()

  Returns a non-constant reference to the internal session object.

- virtual const **cms::Session** * **getSession** () const

  Returns a constant reference to the internal session object.

- virtual void **close** () throw (cms::CMSException)

  Returns this session back to the pool, but does not close or destroy the internal session object.

- virtual void **commit** () throw (cms::CMSException)

  Commits all messages done in this transaction and releases any locks currently held.

- virtual void **rollback** () throw (cms::CMSException)

  Rolls back all messages done in this transaction and releases any locks currently held.

- virtual void **recover** () throw (cms::CMSException)

  Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.

- virtual **cms::MessageConsumer** * **createConsumer** (const **cms::Destination** *destination) throw (cms::CMSException)

  Creates a MessageConsumer for the specified destination.

- virtual **cms::MessageConsumer** * **createConsumer** (const **cms::Destination** *destination, const std::string &selector) throw (cms::CMSException)

  Creates a MessageConsumer for the specified destination, using a message selector.

- virtual **cms::MessageConsumer** * **createConsumer** (const **cms::Destination** *destination, const std::string &selector, bool noLocal) throw (cms::CMSException)

  Creates a MessageConsumer for the specified destination, using a message selector.

- virtual **cms::MessageConsumer** * **createDurableConsumer** (const **cms::Topic** *destination, const std::string &name, const std::string &selector, bool noLocal=false) throw (cms::CMSException)

  Creates a durable subscriber to the specified topic, using a Message selector.

- virtual **cms::MessageConsumer** * **createCachedConsumer** (const **cms::Destination** *destination, const std::string &selector, bool noLocal) throw (cms::CMSException)

  First checks the internal consumer cache and creates on if none exist for the given destination, selector, noLocal.

- virtual **cms::MessageProducer** * **createProducer** (const **cms::Destination** *destination) throw (cms::CMSException)

  Creates a MessageProducer to send messages to the specified destination.

- virtual **cms::MessageProducer** * **createCachedProducer** (const **cms::Destination** *destination) throw (cms::CMSException)

  First checks the internal producer cache and creates one if none exist for the given destination.

- virtual **cms::QueueBrowser** * **createBrowser** (const **cms::Queue** *queue) throw (cms::CMSException)

  Creates a new QueueBrowser to peek at Messages on the given Queue.

- virtual **cms::QueueBrowser** * **createBrowser** (const **cms::Queue** *queue, const std::string &selector) throw (cms::CMSException)

  Creates a new QueueBrowser to peek at Messages on the given Queue.

- virtual **cms::Queue** * **createQueue** (const std::string &queueName) throw (cms::CMSException)

  Creates a queue identity given a Queue name.

- virtual **cms::Topic** * **createTopic** (const std::string &topicName) throw (cms::CMSException)

  Creates a topic identity given a Queue name.

- virtual **cms::TemporaryQueue** * **createTemporaryQueue** () throw (cms::CMSException)

  Creates a TemporaryQueue object.

- virtual **cms::TemporaryTopic** * **createTemporaryTopic** () throw (cms::CMSException)

  Creates a TemporaryTopic object.

- virtual **cms::Message** * **createMessage** () throw (cms::CMSException)

  Creates a new Message.

- virtual **cms::BytesMessage** * **createBytesMessage** () throw (cms::CMSException)

  Creates a BytesMessage.

- virtual **cms::BytesMessage** * **createBytesMessage** (const unsigned char *bytes, std::size_t bytesSize) throw (cms::CMSException)

  Creates a BytesMessage and sets the payload to the passed value.

- virtual **cms::StreamMessage** * **createStreamMessage** () throw (cms::CMSException)

  Creates a new StreamMessage.

- virtual **cms::TextMessage** * **createTextMessage** () throw (cms::CMSException)

  Creates a new TextMessage.

- virtual **cms::TextMessage** * **createTextMessage** (const std::string &text) throw (cms::CMSException)

  Creates a new TextMessage and set the text to the value given.

- virtual **cms::MapMessage** * **createMapMessage** () throw (cms::CMSException)

  Creates a new MapMessage.

- virtual **cms::Session::AcknowledgeMode** **getAcknowledgeMode** () const throw (cms::CMSException)

  Returns the acknowledgment mode of the session.

- virtual bool **isTransacted** () const throw (cms::CMSException)

  Gets if the Sessions is a Transacted Session.

- virtual void **unsubscribe** (const std::string &name) throw (cms::CMSException)

  Unsubscribes a durable subscription that has been created by a client.

6.516.1 Detailed Description

A pooled session object that wraps around a delegate session. Calls to close this session only result in giving the session back to the pool.

6.516.2 Constructor & Destructor Documentation

6.516.2.1 activemq::cmsutil::PooledSession::PooledSession (SessionPool * *pool*, cms::Session * *session*)

6.516.2.2 virtual activemq::cmsutil::PooledSession::~PooledSession () [virtual]

Does nothing.

6.516.3 Member Function Documentation

6.516.3.1 virtual void activemq::cmsutil::PooledSession::close () throw (cms::CMSException) [virtual]

Returns this session back to the pool, but does not close or destroy the internal session object.

Implements **cms::Session** (p. 2842).

6.516.3.2 virtual void activemq::cmsutil::PooledSession::commit () throw (cms::CMSException) [inline, virtual]

Commits all messages done in this transaction and releases any locks currently held.

Exceptions:

CMSException - If an internal error occurs.

IllegalStateException - if the method is not called by a transacted session.

Implements **cms::Session** (p. 2843).

References cms::Session::commit().

6.516.3.3 virtual cms::QueueBrowser* activemq::cmsutil::PooledSession::createBrowser (const cms::Queue * *queue*, const std::string & *selector*) throw (cms::CMSException) [virtual]

Creates a new QueueBrowser to peek at Messages on the given Queue.

Parameters:

queue the Queue to browse

selector the Message selector to filter which messages are browsed.

Returns:

New QueueBrowser that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if the destination given is invalid.

Implements **cms::Session** (p. 2843).

6.516.3.4 virtual cms::QueueBrowser* activemq::cmsutil::PooledSession::createBrowser (const cms::Queue * *queue*) throw (cms::CMSException) [virtual]

Creates a new QueueBrowser to peek at Messages on the given Queue.

Parameters:

queue the Queue to browse

Returns:

New QueueBrowser that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if the destination given is invalid.

Implements **cms::Session** (p. 2843).

6.516.3.5 virtual cms::BytesMessage* activemq::cmsutil::PooledSession::createBytesMessage (const unsigned char * *bytes*, std::size_t *bytesSize*) throw (cms::CMSException) [inline, virtual]

Creates a BytesMessage and sets the payload to the passed value.

Parameters:

bytes an array of bytes to set in the message

bytesSize the size of the bytes array, or number of bytes to use

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2844).

References cms::Session::createBytesMessage().

6.516.3.6 virtual cms::BytesMessage* activemq::cmsutil::PooledSession::createBytesMessage () throw (cms::CMSException) [inline, virtual]

Creates a BytesMessage.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2844).

References cms::Session::createBytesMessage().

6.516.3.7 virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createCachedConsumer (const cms::Destination * *destination*, const std::string & *selector*, bool *noLocal*) throw (cms::CMSException) [virtual]

First checks the internal consumer cache and creates on if none exist for the given destination, selector, noLocal. If created, the consumer is added to the pool's lifecycle manager.

Parameters:

destination the destination to receive on

selector the selector to use

noLocal whether or not to receive messages from the same connection

Returns:

the consumer resource

Exceptions:

cms::CMSException *(*p. ***1031)*** if something goes wrong.

6.516.3.8 virtual cms::MessageProducer* activemq::cmsutil::PooledSession::createCachedProducer (const cms::Destination * *destination*) throw (cms::CMSException) [virtual]

First checks the internal producer cache and creates one if none exist for the given destination. If created, the producer is added to the pool's lifecycle manager.

Parameters:

destination the destination to send on

Returns:

the producer resource

Exceptions:

cms::CMSException *(*p. ***1031)*** if something goes wrong.

6.516.3.9 virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createConsumer (const cms::Destination * *destination*, const std::string & *selector*, bool *noLocal*) throw (cms::CMSException) [inline, virtual]

Creates a MessageConsumer for the specified destination, using a message selector.

Parameters:

destination the Destination that this consumer receiving messages for.

selector the Message Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns:

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

InvalidSelectorException - if the message selector is invalid.

Implements **cms::Session** (p. 2844).

References cms::Session::createConsumer().

6.516.3.10 virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createConsumer (const cms::Destination * *destination*, const std::string & *selector*) throw (cms::CMSException) [inline, virtual]

Creates a MessageConsumer for the specified destination, using a message selector.

Parameters:

destination the Destination that this consumer receiving messages for.

selector the Message Selector to use

Returns:

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

InvalidSelectorException - if the message selector is invalid.

Implements **cms::Session** (p. 2845).

References cms::Session::createConsumer().

6.516.3.11 virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createConsumer (const cms::Destination * *destination*) throw (cms::CMSException) [inline, virtual]

Creates a MessageConsumer for the specified destination.

Parameters:

destination the Destination that this consumer receiving messages for.

Returns:

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

Implements **cms::Session** (p. 2845).

References cms::Session::createConsumer().

6.516.3.12 virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createDurableConsumer (const cms::Topic * *destination*, const std::string & *name*, const std::string & *selector*, bool *noLocal* = false) throw (cms::CMSException) [inline, virtual]

Creates a durable subscriber to the specified topic, using a Message selector. Sessions that create durable consumers must use the same client Id as was used the last time the subscription was created in order to receive all messages that were delivered while the client was offline.

Parameters:

destination the topic to subscribe to

name The name used to identify the subscription

selector the Message Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns:

pointer to a new durable MessageConsumer that is owned by the caller (caller deletes)

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

InvalidSelectorException - if the message selector is invalid.

Implements **cms::Session** (p. 2846).

References cms::Session::createDurableConsumer().

6.516.3.13 virtual cms::MapMessage* activemq::cmsutil::PooledSession::createMapMessage () throw (cms::CMSException) [inline, virtual]

Creates a new MapMessage.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2846).

References cms::Session::createMapMessage().

6.516.3.14 virtual cms::Message* activemq::cmsutil::PooledSession::createMessage () throw (cms::CMSException) [inline, virtual]

Creates a new Message.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2847).

References cms::Session::createMessage().

6.516.3.15 virtual cms::MessageProducer* activemq::cmsutil::PooledSession::createProducer (const cms::Destination * *destination*) throw (cms::CMSException) [inline, virtual]

Creates a MessageProducer to send messages to the specified destination.

Parameters:

destination the Destination to send on

Returns:

New MessageProducer that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

Implements **cms::Session** (p. 2847).

References cms::Session::createProducer().

6.516.3.16 virtual cms::Queue* activemq::cmsutil::PooledSession::createQueue (const std::string & *queueName*) throw (cms::CMSException) [inline, virtual]

Creates a queue identity given a Queue name.

Parameters:

queueName the name of the new Queue

Returns:

new Queue pointer that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2847).

References cms::Session::createQueue().

6.516.3.17 virtual cms::StreamMessage* activemq::cmsutil::PooledSession::createStreamMessage () throw (cms::CMSException) [inline, virtual]

Creates a new StreamMessage.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2848).

References cms::Session::createStreamMessage().

6.516.3.18 virtual cms::TemporaryQueue* activemq::cmsutil::PooledSession::createTemporaryQueue () throw (cms::CMSException) [inline, virtual]

Creates a TemporaryQueue object.

Returns:

new TemporaryQueue pointer that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2848).

References cms::Session::createTemporaryQueue().

6.516.3.19 virtual cms::TemporaryTopic* activemq::cmsutil::PooledSession::createTemporaryTopic () throw (cms::CMSException) [inline, virtual]

Creates a TemporaryTopic object.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2848).

References cms::Session::createTemporaryTopic().

6.516.3.20 virtual cms::TextMessage* activemq::cmsutil::PooledSession::createTextMessage (const std::string & *text*) throw (cms::CMSException) [inline, virtual]

Creates a new TextMessage and set the text to the value given.

Parameters:

text the initial text for the message

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2848).

References cms::Session::createTextMessage().

6.516.3.21 virtual cms::TextMessage* activemq::cmsutil::PooledSession::createTextMessage () throw (cms::CMSException) [inline, virtual]

Creates a new TextMessage.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2849).

References cms::Session::createTextMessage().

6.516.3.22 virtual cms::Topic* activemq::cmsutil::PooledSession::createTopic (const std::string & *topicName*) throw (cms::CMSException) [inline, virtual]

Creates a topic identity given a Queue name.

Parameters:

topicName the name of the new Topic

Returns:

new Topic pointer that is owned by the caller.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2849).

References cms::Session::createTopic().

6.516.3.23 virtual cms::Session::AcknowledgeMode activemq::cmsutil::PooledSession::getAcknowledgeMode () const throw (cms::CMSException) [inline, virtual]

Returns the acknowledgment mode of the session.

Returns:

the Sessions Acknowledge Mode

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2849).

References cms::Session::getAcknowledgeMode().

6.516.3.24 virtual const cms::Session* activemq::cmsutil::PooledSession::getSession () const [inline, virtual]

Returns a constant reference to the internal session object.

Returns:

the session object.

6.516.3.25 virtual cms::Session* activemq::cmsutil::PooledSession::getSession () [inline, virtual]

Returns a non-constant reference to the internal session object.

Returns:

the session object.

6.516.3.26 virtual bool activemq::cmsutil::PooledSession::isTransacted () const throw (cms::CMSException) [inline, virtual]

Gets if the Sessions is a Transacted Session.

Returns:

transacted true - false.

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2850).

References cms::Session::isTransacted().

6.516.3.27 virtual void activemq::cmsutil::PooledSession::recover () throw (cms::CMSException) [inline, virtual]

Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message. All consumers deliver messages in a serial order. Acknowledging a received message automatically acknowledges all messages that have been delivered to the client.

Restarting a session causes it to take the following actions:

- Stop message delivery
- Mark all messages that might have been delivered but not acknowledged as "redelivered"
- Restart the delivery sequence including all unacknowledged messages that had been previously delivered. Redelivered messages do not have to be delivered in exactly their original delivery order.

Exceptions:

CMSException - if the CMS provider fails to stop and restart message delivery due to some internal error.

IllegalStateException - if the method is called by a transacted session.

Implements **cms::Session** (p. 2850).

References cms::Session::recover().

6.516.3.28 virtual void activemq::cmsutil::PooledSession::rollback () throw (cms::CMSException) [inline, virtual]

Rolls back all messages done in this transaction and releases any locks currently held.

Exceptions:

CMSException - If an internal error occurs.

IllegalStateException - if the method is not called by a transacted session.

Implements **cms::Session** (p. 2850).

References cms::Session::rollback().

6.516.3.29 virtual void activemq::cmsutil::PooledSession::unsubscribe (const std::string & *name*) throw (cms::CMSException) [inline, virtual]

Unsubscribes a durable subscription that has been created by a client. This method deletes the state being maintained on behalf of the subscriber by its provider. It is erroneous for a client to delete a durable subscription while there is an active MessageConsumer or Subscriber for the subscription, or while a consumed message is part of a pending transaction or has not been acknowledged in the session.

Parameters:

name The name used to identify this subscription

Exceptions:

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2851).

References cms::Session::unsubscribe().

The documentation for this class was generated from the following file:

6.517 decaf::util::concurrent::PooledThread Class Reference

`#include <src/main/decaf/util/concurrent/PooledThread.h>`

Public Member Functions

- **PooledThread** (**ThreadPool** *pool)

  Constructor.

- virtual ~**PooledThread** ()
- virtual void **run** ()

  *Run Method for this object waits for something to be enqueued on the **ThreadPool** (p. 3175) and then grabs it and calls its run method.*

- virtual void **stop** () throw (lang::Exception)

  Stops the Thread, thread will complete its task if currently running one, and then die.

- virtual bool **isBusy** ()

  Checks to see if the thread is busy, if busy it means that this thread has taken a task from the ThreadPool's queue and is processing it.

- virtual void **setPooledThreadListener** (**PooledThreadListener** *listener)

  Adds a listener to this `PooledThread` (p. 2518) to be notified when this thread starts and completes a task.

- virtual **PooledThreadListener** * **getPooledThreadListener** ()

  Removes a listener for this `PooledThread` (p. 2518) to be notified when this thread starts and completes a task.

6.517.1 Constructor & Destructor Documentation

6.517.1.1 decaf::util::concurrent::PooledThread::PooledThread (ThreadPool * *pool*)

Constructor.

Parameters:

pool the parant **ThreadPool** (p. 3175) object

6.517.1.2 virtual decaf::util::concurrent::PooledThread::~PooledThread () [virtual]

6.517.2 Member Function Documentation

6.517.2.1 virtual PooledThreadListener* decaf::util::concurrent::PooledThread::getPooledThreadListener () [inline, virtual]

Removes a listener for this `PooledThread` (p. 2518) to be notified when this thread starts and completes a task.

Returns:

a pointer to this thread's listener or NULL

6.517.2.2 virtual bool decaf::util::concurrent::PooledThread::isBusy () [inline, virtual]

Checks to see if the thread is busy, if busy it means that this thread has taken a task from the ThreadPool's queue and is processing it.

Returns:

true if the Thread is busy

6.517.2.3 virtual void decaf::util::concurrent::PooledThread::run () [virtual]

Run Method for this object waits for something to be enqueued on the **ThreadPool** (p. 3175) and then grabs it and calls its run method.

6.517.2.4 virtual void decaf::util::concurrent::PooledThread::setPooledThreadListener (PooledThreadListener * *listener*) [inline, virtual]

Adds a listener to this `PooledThread` (p. 2518) to be notified when this thread starts and completes a task.

Parameters:

listener the listener to send notifications to.

6.517.2.5 virtual void decaf::util::concurrent::PooledThread::stop () throw (lang::Exception) [virtual]

Stops the Thread, thread will complete its task if currently running one, and then die. Does not block.

Exceptions:

Exception

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**PooledThread.h**

6.518 decaf::util::concurrent::PooledThreadListener Class Reference

Abstract Listener Interface for users of `ThreadPool` (p. 3175).

`#include <src/main/decaf/util/concurrent/PooledThreadListener.h>`Inheritance diagram for decaf::util::concurrent::PooledThreadListener:

Public Member Functions

- virtual ~**PooledThreadListener** ()
- virtual void **onTaskStarted** (**PooledThread** *thread)=0

  Called by a pooled thread when it is about to begin executing a new task.

- virtual void **onTaskCompleted** (**PooledThread** *thread)=0

  Called by a pooled thread when it has completed a task and is going back to waiting for another task to run.

- virtual void **onTaskException** (**PooledThread** *thread, **lang::Exception** &ex)=0

  *Called by a pooled thread when it has encountered an exception while running a user task, after receiving this notification the callee should assume that the **PooledThread** (p. 2518) is now no longer running.*

6.518.1 Detailed Description

Abstract Listener Interface for users of `ThreadPool` (p. 3175). The implementor of this class receives events related to the execution and termination of threads running in the **ThreadPool** (p. 3175).

Since:

1.0

6.518.2 Constructor & Destructor Documentation

6.518.2.1 virtual decaf::util::concurrent::PooledThreadListener::~PooledThreadListener () [inline, virtual]

6.518.3 Member Function Documentation

6.518.3.1 virtual void decaf::util::concurrent::PooledThreadListener::onTaskCompleted (PooledThread * *thread*) [pure virtual]

Called by a pooled thread when it has completed a task and is going back to waiting for another task to run.

Parameters:

thread - Pointer the the Pooled Thread that is making this call.

Implemented in **decaf::util::concurrent::ThreadPool** (p. 3178).

6.518.3.2 virtual void decaf::util::concurrent::PooledThreadListener::onTaskException (PooledThread * *thread*, lang::Exception & *ex*) [pure virtual]

Called by a pooled thread when it has encountered an exception while running a user task, after receiving this notification the callee should assume that the **PooledThread** (p. 2518) is now no longer running.

Parameters:

thread - Pointer to the Pooled Thread that is making this call

ex - The Exception that occurred.

Implemented in **decaf::util::concurrent::ThreadPool** (p. 3178).

6.518.3.3 virtual void decaf::util::concurrent::PooledThreadListener::onTaskStarted (PooledThread * *thread*) [pure virtual]

Called by a pooled thread when it is about to begin executing a new task.

Parameters:

thread - Pointer to the Pooled Thread that is making this call

Implemented in **decaf::util::concurrent::ThreadPool** (p. 3179).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**PooledThreadListener.h**

6.519 decaf::net::PortUnreachableException Class Reference

`#include <src/main/decaf/net/PortUnreachableException.h>`Inheritance diagram for decaf::net::PortUnreachableException:

Public Member Functions

- **PortUnreachableException** () throw ()
  Default Constructor.
- **PortUnreachableException** (const Exception &ex) throw ()
  Conversion Constructor from some other Exception.
- **PortUnreachableException** (const **PortUnreachableException** &ex) throw ()
  Copy Constructor.
- **PortUnreachableException** (const char *file, const int lineNumber, const std::exception ***cause**, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- **PortUnreachableException** (const std::exception ***cause**) throw ()
  Constructor.
- **PortUnreachableException** (const char *file, const int lineNumber, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **PortUnreachableException** * **clone** () const
  Clones this exception.
- virtual ~**PortUnreachableException** () throw ()

6.519.1 Constructor & Destructor Documentation

6.519.1.1 decaf::net::PortUnreachableException::PortUnreachableException () throw () [inline]

Default Constructor.

6.519.1.2 decaf::net::PortUnreachableException::PortUnreachableException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.519.1.3 decaf::net::PortUnreachableException::PortUnreachableException (const PortUnreachableException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.519.1.4 decaf::net::PortUnreachableException::PortUnreachableException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.519.1.5 decaf::net::PortUnreachableException::PortUnreachableException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.519.1.6 decaf::net::PortUnreachableException::PortUnreachableException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.519.1.7 virtual decaf::net::PortUnreachableException::~PortUnreachableException () throw () [inline, virtual]

6.519.2 Member Function Documentation

6.519.2.1 virtual PortUnreachableException* decaf::net::PortUnreachableException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 2973).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**PortUnreachableException.h**

6.520 activemq::util::PrimitiveList Class Reference

List of primitives.

`#include <src/main/activemq/util/PrimitiveList.h>`Inheritance diagram for activemq::util::PrimitiveList:

Public Member Functions

- **PrimitiveList** ()

  Default Constructor, creates an Empty list.

- virtual ~**PrimitiveList** ()
- **PrimitiveList** (const **decaf::util::List**< **PrimitiveValueNode** > &src)

  Copy Constructor.

- **PrimitiveList** (const **PrimitiveList** &src)

  Copy Constructor.

- std::string **toString** () const

  Converts the contents into a formatted string that can be output in a Log File or other debugging tool.

- virtual bool **getBool** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

  Gets the Boolean value at the specified index.

- virtual void **setBool** (std::size_t index, bool value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual unsigned char **getByte** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

  Gets the Byte value at the specified index.

- virtual void **setByte** (std::size_t index, unsigned char value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual char **getChar** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

  Gets the Character value at the specified index.

- virtual void **setChar** (std::size_t index, char value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual short **getShort** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

  Gets the Short value at the specified index.

- virtual void **setShort** (std::size_t index, short value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual int **getInt** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

  Gets the Integer value at the specified index.

- virtual void **setInt** (std::size_t index, int value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual long long **getLong** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

  Gets the Long value at the specified index.

- virtual void **setLong** (std::size_t index, long long value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual float **getFloat** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

  Gets the Float value at the specified index.

- virtual void **setFloat** (std::size_t index, float value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual double **getDouble** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Double value at the specified index.

- virtual void **setDouble** (std::size_t index, double value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual std::string **getString** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

  Gets the String value at the specified index.

- virtual void **setString** (std::size_t index, const std::string &value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual std::vector< unsigned char > **getByteArray** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

  Gets the Byte Array value at the specified index.

- virtual void **setByteArray** (std::size_t index, const std::vector< unsigned char > &value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

6.520.1 Detailed Description

List of primitives.

6.520.2 Constructor & Destructor Documentation

6.520.2.1 activemq::util::PrimitiveList::PrimitiveList ()

Default Constructor, creates an Empty list.

6.520.2.2 virtual activemq::util::PrimitiveList::~PrimitiveList () [virtual]

6.520.2.3 activemq::util::PrimitiveList::PrimitiveList (const decaf::util::List< PrimitiveValueNode > & *src*)

Copy Constructor.

Parameters:

src - the Decaf List of PrimtiveNodeValues to copy

6.520.2.4 activemq::util::PrimitiveList::PrimitiveList (const PrimitiveList & *src*)

Copy Constructor.

Parameters:

src - the **PrimitiveList** (p. 2525) to copy

6.520.3 Member Function Documentation

6.520.3.1 virtual bool activemq::util::PrimitiveList::getBool (std::size_t *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Boolean value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 3028)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.520.3.2 virtual unsigned char activemq::util::PrimitiveList::getByte (std::size_t *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Byte value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 3028)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.520.3.3 virtual std::vector<unsigned char> activemq::util::PrimitiveList::getByteArray (std::size_t *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Byte Array value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 3028)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.520.3.4 virtual char activemq::util::PrimitiveList::getChar (std::size_t *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Character value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 3028)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.520.3.5 virtual double activemq::util::PrimitiveList::getDouble (std::size_t *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Double value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 3028)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.520.3.6 virtual float activemq::util::PrimitiveList::getFloat (std::size_t *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Float value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 3028)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.520.3.7 virtual int activemq::util::PrimitiveList::getInt (std::size_t *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Integer value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 3028)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.520.3.8 virtual long long activemq::util::PrimitiveList::getLong (std::size_t *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Long value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 3028)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.520.3.9 virtual short activemq::util::PrimitiveList::getShort (std::size_t *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Short value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 3028)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.520.3.10 virtual std::string activemq::util::PrimitiveList::getString (std::size_t *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the String value at the specified index.

Parameters:

index - index to get value from

Returns:

value contained at the given index

Exceptions:

IndexOutOfBoundsException if index is > **size()** (p. 3028)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.520.3.11 virtual void activemq::util::PrimitiveList::setBool (std::size_t *index*, bool *value*) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > **size()** (p. 3028).

6.520.3.12 virtual void activemq::util::PrimitiveList::setByte (std::size_t *index*, unsigned char *value*) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > **size()** (p. 3028).

6.520.3.13 virtual void activemq::util::PrimitiveList::setByteArray (std::size_t *index*, const std::vector< unsigned char > & *value*) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > **size()** (p. 3028).

6.520.3.14 virtual void activemq::util::PrimitiveList::setChar (std::size_t *index*, char *value*) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > **size()** (p. 3028).

6.520.3.15 virtual void activemq::util::PrimitiveList::setDouble (std::size_t *index*, double *value*) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > **size()** (p. 3028).

6.520.3.16 virtual void activemq::util::PrimitiveList::setFloat (std::size_t *index*, float *value*) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > **size()** (p. 3028).

6.520.3.17 virtual void activemq::util::PrimitiveList::setInt (std::size_t *index*, int *value*) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > **size()** (p. 3028).

6.520.3.18 virtual void activemq::util::PrimitiveList::setLong (std::size_t *index*, long long *value*) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > **size()** (p. 3028).

6.520.3.19 virtual void activemq::util::PrimitiveList::setShort (std::size_t *index*, short *value*) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > **size()** (p. 3028).

6.520.3.20 virtual void activemq::util::PrimitiveList::setString (std::size_t *index*, const std::string & *value*) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters:

index - location to set in the list

value - the new value to assign to the element at index

Exceptions:

IndexOutOfBoundsException if index > **size()** (p. 3028).

6.520.3.21 std::string activemq::util::PrimitiveList::toString () const

Converts the contents into a formatted string that can be output in a Log File or other debugging tool.

Returns:

formatted String of all elements in the list.

The documentation for this class was generated from the following file:

- src/main/activemq/util/**PrimitiveList.h**

6.521 activemq::util::PrimitiveMap Class Reference

Map of named primitives.

`#include <src/main/activemq/util/PrimitiveMap.h>`Inheritance diagram for activemq::util::PrimitiveMap:

Public Member Functions

- **PrimitiveMap** ()

  Default Constructor, creates an empty map.

- virtual ~**PrimitiveMap** ()
- **PrimitiveMap** (const **decaf::util::Map**< std::string, **PrimitiveValueNode** > &source)

  Copy Constructor.

- **PrimitiveMap** (const **PrimitiveMap** &source)

  Copy Constructor.

- std::string **toString** () const

  Converts the contents into a formatted string that can be output in a Log File or other debugging tool.

- virtual bool **getBool** (const std::string &key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

  Gets the Boolean value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setBool** (const std::string &key, bool value)

  Sets the value at key to the specified type.

- virtual unsigned char **getByte** (const std::string &key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

  Gets the Byte value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setByte** (const std::string &key, unsigned char value)

  Sets the value at key to the specified type.

- virtual char **getChar** (const std::string &key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

  Gets the Character value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setChar** (const std::string &key, char value)

Sets the value at key to the specified type.

- virtual short **getShort** (const std::string &key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

  Gets the Short value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setShort** (const std::string &key, short value)

  Sets the value at key to the specified type.

- virtual int **getInt** (const std::string &key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

  Gets the Integer value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setInt** (const std::string &key, int value)

  Sets the value at key to the specified type.

- virtual long long **getLong** (const std::string &key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

  Gets the Long value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setLong** (const std::string &key, long long value)

  Sets the value at key to the specified type.

- virtual float **getFloat** (const std::string &key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

  Gets the Float value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setFloat** (const std::string &key, float value)

  Sets the value at key to the specified type.

- virtual double **getDouble** (const std::string &key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

  Gets the Double value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setDouble** (const std::string &key, double value)

  Sets the value at key to the specified type.

- virtual std::string **getString** (const std::string &key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

  Gets the String value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setString** (const std::string &key, const std::string &value)

  Sets the value at key to the specified type.

- virtual std::vector< unsigned char > **getByteArray** (const std::string &key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

  Gets the Byte Array value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

- virtual void **setByteArray** (const std::string &key, const std::vector< unsigned char > &value)

  Sets the value at key to the specified type.

6.521.1 Detailed Description

Map of named primitives.

6.521.2 Constructor & Destructor Documentation

6.521.2.1 activemq::util::PrimitiveMap::PrimitiveMap ()

Default Constructor, creates an empty map.

6.521.2.2 virtual activemq::util::PrimitiveMap::~PrimitiveMap () [virtual]

6.521.2.3 activemq::util::PrimitiveMap::PrimitiveMap (const decaf::util::Map< std::string, PrimitiveValueNode > & *source*)

Copy Constructor.

Parameters:

source The Decaf Library Map instance whose elements will be copied into this Map.

6.521.2.4 activemq::util::PrimitiveMap::PrimitiveMap (const PrimitiveMap & *source*)

Copy Constructor.

Parameters:

source The **PrimitiveMap** (p. 2536) whose elements will be copied into this Map.

6.521.3 Member Function Documentation

6.521.3.1 virtual bool activemq::util::PrimitiveMap::getBool (const std::string & *key*) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Boolean value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnSupportedOperationException if the value cannot be converted to the type this method returns

6.521.3.2 virtual unsigned char activemq::util::PrimitiveMap::getByte (const std::string & *key*) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Byte value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnSupportedOperationException if the value cannot be converted to the type this method returns

6.521.3.3 virtual std::vector<unsigned char> activemq::util::PrimitiveMap::getByteArray (const std::string & *key*) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Byte Array value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnSupportedOperationException if the value cannot be converted to the type this method returns

6.521.3.4 virtual char activemq::util::PrimitiveMap::getChar (const std::string & *key*) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Character value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnSupportedOperationException if the value cannot be converted to the type this method returns

6.521.3.5 virtual double activemq::util::PrimitiveMap::getDouble (const std::string & *key*) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Double value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnSupportedOperationException if the value cannot be converted to the type this method returns

6.521.3.6 virtual float activemq::util::PrimitiveMap::getFloat (const std::string & *key*) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Float value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnSupportedOperationException if the value cannot be converted to the type this method returns

6.521.3.7 virtual int activemq::util::PrimitiveMap::getInt (const std::string & *key*) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Integer value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnSupportedOperationException if the value cannot be converted to the type this method returns

6.521.3.8 virtual long long activemq::util::PrimitiveMap::getLong (const std::string & *key*) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Long value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnSupportedOperationException if the value cannot be converted to the type this method returns

6.521.3.9 virtual short activemq::util::PrimitiveMap::getShort (const std::string & *key*) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Short value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnSupportedOperationException if the value cannot be converted to the type this method returns

6.521.3.10 virtual std::string activemq::util::PrimitiveMap::getString (const std::string & *key*) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the String value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters:

key - the location to return the value from.

Returns:

the value at key in the type requested.

Exceptions:

NoSuchElementException if key is not in the map.

UnSupportedOperationException if the value cannot be converted to the type this method returns

6.521.3.11 virtual void activemq::util::PrimitiveMap::setBool (const std::string & *key*, bool *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.521.3.12 virtual void activemq::util::PrimitiveMap::setByte (const std::string & *key*, unsigned char *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.521.3.13 virtual void activemq::util::PrimitiveMap::setByteArray (const std::string & *key*, const std::vector< unsigned char > & *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.521.3.14 virtual void activemq::util::PrimitiveMap::setChar (const std::string & *key*, char *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.521.3.15 virtual void activemq::util::PrimitiveMap::setDouble (const std::string & *key*, double *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.521.3.16 virtual void activemq::util::PrimitiveMap::setFloat (const std::string & *key*, float *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.521.3.17 virtual void activemq::util::PrimitiveMap::setInt (const std::string & *key*, int *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.521.3.18 virtual void activemq::util::PrimitiveMap::setLong (const std::string & *key*, long long *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.521.3.19 virtual void activemq::util::PrimitiveMap::setShort (const std::string & *key*, short *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.521.3.20 virtual void activemq::util::PrimitiveMap::setString (const std::string & *key*, const std::string & *value*) [virtual]

Sets the value at key to the specified type. Overwrites any data that was previously at this key or inserts a new element at key.

Parameters:

key - the map key to set or insert.

value - the new value to set at the key location.

6.521.3.21 std::string activemq::util::PrimitiveMap::toString () const

Converts the contents into a formatted string that can be output in a Log File or other debugging tool.

Returns:

formatted String of all elements in the map.

The documentation for this class was generated from the following file:

- src/main/activemq/util/**PrimitiveMap.h**

6.522 activemq::wireformat::openwire::marshal::PrimitiveTypesMarshall Class Reference

This class wraps the functionality needed to marshal a primitive map to the Openwire Format's expectation of what the map looks like on the wire.

`#include <src/main/activemq/wireformat/openwire/marshal/PrimitiveTypesMarshaller.h>`

Public Member Functions

- **PrimitiveTypesMarshaller** ()
- virtual ~**PrimitiveTypesMarshaller** ()

Static Public Member Functions

- static void **marshal** (const **util::PrimitiveMap** *map, std::vector< unsigned char > &dest) throw (decaf::lang::Exception)

  Static Marshal of a primitive map object.

- static void **unmarshal** (**util::PrimitiveMap** *map, const std::vector< unsigned char > &src) throw (decaf::lang::Exception)

  Static Map Unmarshaler, takes an array of bytes and returns a new instance of a PrimitiveMap object.

- static void **marshal** (const **util::PrimitiveList** *list, std::vector< unsigned char > &dest) throw (decaf::lang::Exception)

  Static Marshal of a primitive map object.

- static void **unmarshal** (**util::PrimitiveList** *list, const std::vector< unsigned char > &src) throw (decaf::lang::Exception)

  Static Map Unmarshaler, takes an array of bytes and returns a new instance of a PrimitiveMap object.

Static Protected Member Functions

- static void **marshalPrimitiveMap** (**decaf::io::DataOutputStream** &dataOut, const **decaf::util::Map**< std::string, **util::PrimitiveValueNode** > &map) throw (decaf::io::IOException)

  Marshal a Map of Primitives to the given OutputStream, can result in recursive calls to this method if the map contains maps of maps.

- static void **marshalPrimitiveList** (**decaf::io::DataOutputStream** &dataOut, const **decaf::util::List**< **util::PrimitiveValueNode** > &list) throw (decaf::io::IOException)

  Marshal a List of Primitives to the given OutputStream, can result in recursive calls to this method if the list contains lists of lists.

- static void **marshalPrimitive** (**decaf::io::DataOutputStream** &dataOut, const **util::PrimitiveValueNode** &value) throw (decaf::io::IOException)

  Used to Marshal the Primitive types out on the Wire.

- static void **unmarshalPrimitiveMap** (**decaf::io::DataInputStream** &dataIn, **util::PrimitiveMap** &map) throw (decaf::io::IOException)

  Unmarshals a Map of Primitives from the given InputStream, can result in recursive calls to this method if the map contains maps of maps.

- static void **unmarshalPrimitiveList** (**decaf::io::DataInputStream** &dataIn, **decaf::util::StlList**< **util::PrimitiveValueNode** > &list) throw (decaf::io::IOException)

  Unmarshals a List of Primitives from the given InputStream, can result in recursive calls to this method if the list contains lists of lists.

- static **util::PrimitiveValueNode unmarshalPrimitive** (**decaf::io::DataInputStream** &dataIn) throw (decaf::io::IOException)

  Unmarshals a Primitive Type from the stream, and returns it as a value Node.

6.522.1 Detailed Description

This class wraps the functionality needed to marshal a primitive map to the Openwire Format's expectation of what the map looks like on the wire.

6.522.2 Constructor & Destructor Documentation

6.522.2.1 activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::PrimitiveTypesMars () [inline]

6.522.2.2 virtual activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::~PrimitiveTypesMa () [inline, virtual]

6.522.3 Member Function Documentation

6.522.3.1 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshal (const util::PrimitiveList * *list*, std::vector< unsigned char > & *dest*) throw (decaf::lang::Exception) [static]

Static Marshal of a primitive map object.

Parameters:

list The list object to Marshal

dest Reference to a byte array to house the data

Exceptions:

Exception

6.522.3.2 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshal (const util::PrimitiveMap * *map*, std::vector< unsigned char > & *dest*) throw (decaf::lang::Exception) [static]

Static Marshal of a primitive map object.

Parameters:

map Map to Marshal.

dest Reference to a byte array to house the data.

Exceptions:

Exception

6.522.3.3 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalPrimitive (decaf::io::DataOutputStream & *dataOut*, const util::PrimitiveValueNode & *value*) throw (decaf::io::IOException) [static, protected]

Used to Marshal the Primitive types out on the Wire.

Parameters:

dataOut - the DataOutputStream to write to

value - the ValueNode to write.

Exceptions:

IOException

6.522.3.4 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalPrimitiveList (decaf::io::DataOutputStream & *dataOut*, const decaf::util::List< util::PrimitiveValueNode > & *list*) throw (decaf::io::IOException) [static, protected]

Marshal a List of Primitives to the given OutputStream, can result in recursive calls to this method if the list contains lists of lists.

Parameters:

dataOut - the DataOutputStream to write to

list - the ValueNode to write.

Exceptions:

IOException

6.522.3.5 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalPrimitiveMap (decaf::io::DataOutputStream & *dataOut*, const decaf::util::Map< std::string, util::PrimitiveValueNode > & *map*) throw (decaf::io::IOException) [static, protected]

Marshal a Map of Primitives to the given OutputStream, can result in recursive calls to this method if the map contains maps of maps.

Parameters:

dataOut - the DataOutputStream to write to

map - the ValueNode to write.

Exceptions:

IOException

6.522.3.6 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshal (util::PrimitiveList * *list*, const std::vector< unsigned char > & *src*) throw (decaf::lang::Exception) [static]

Static Map Unmarshaler, takes an array of bytes and returns a new instance of a PrimitiveMap object. Caller owns the pointer.

Parameters:

list The list object to Un-marshal

src Reference to a byte array to read data from.

Exceptions:

Exception

6.522.3.7 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshal (util::PrimitiveMap * *map*, const std::vector< unsigned char > & *src*) throw (decaf::lang::Exception) [static]

Static Map Unmarshaler, takes an array of bytes and returns a new instance of a PrimitiveMap object. Caller owns the pointer.

Parameters:

map Map to Unmarshal into

src Reference to a byte array to read data from.

Exceptions:

Exception

6.522.3.8 static util::PrimitiveValueNode activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalPrimitive (decaf::io::DataInputStream & *dataIn*) throw (decaf::io::IOException) [static, protected]

Unmarshals a Primitive Type from the stream, and returns it as a value Node.

Parameters:

dataIn - DataInputStream to read from.

Returns:

a PrimitiveValueNode containing the data.

Exceptions:

IOException

6.522.3.9 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalPrimitiveLis (decaf::io::DataInputStream & *dataIn*, decaf::util::StlList< util::PrimitiveValueNode > & *list*) throw (decaf::io::IOException) [static, protected]

Unmarshals a List of Primitives from the given InputStream, can result in recursive calls to this method if the list contains lists of lists.

Parameters:

dataIn - DataInputStream to read from.
list - the ValueNode to write.

Exceptions:

IOException

6.522.3.10 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalPrimitiveM (decaf::io::DataInputStream & *dataIn*, util::PrimitiveMap & *map*) throw (decaf::io::IOException) [static, protected]

Unmarshals a Map of Primitives from the given InputStream, can result in recursive calls to this method if the map contains maps of maps.

Parameters:

dataIn - DataInputStream to read from.
map - the map to fill with data.

Exceptions:

IOException

6.524 activemq::util::PrimitiveValueConverter Class Reference

Class controls the conversion of data contained in a **PrimitiveValueNode** (p. 2555) from one type to another.

`#include <src/main/activemq/util/PrimitiveValueConverter.h>`

Public Member Functions

- **PrimitiveValueConverter** ()
- virtual ~**PrimitiveValueConverter** ()
- template<typename TO >
  TO **convert** (const **PrimitiveValueNode** &value) const throw (decaf::lang::exceptions::UnsupportedOperationException)

6.524.1 Detailed Description

Class controls the conversion of data contained in a **PrimitiveValueNode** (p. 2555) from one type to another. If the conversion is supported then calling the convert method will throw an UnsupportedOperationException to indicate that its not possible to perform the conversion.

This class is used to implement the rules of conversion on CMS Message properties, the following conversion table must be implemented. A value written as the row type can be read in the column type.

| | boolean byte short int long float double String |----------|-------|-------|-------|-------|-------|-------|-------| |boolean | X | | | | | | | X | |byte | | X | X | X | X | | | X | |short | | | X | X | X | | | X | |int | | | | X | X | | | X | |long | | | | | X | | | X | |float | | | | | | X | X | X | |double | | | | | | | X | X | |String | X | X | X | X | X | X | X | X |----------|-------|-------|-------|-------|-------|-------|-------|-------|

  FLOAT_TYPE = 8, **STRING_TYPE** = 9, **BYTE_ARRAY_TYPE** = 10, **MAP_TYPE** = 11,

  LIST_TYPE = 12, **BIG_STRING_TYPE** = 13 }

  Enumeration for the various primitive types.

Public Member Functions

- **PrimitiveValueNode** ()

  Default Constructor, creates a value of the NULL_TYPE.

- **PrimitiveValueNode** (bool value)

  Boolean Value Constructor.

- **PrimitiveValueNode** (unsigned char value)

  Byte Value Constructor.

- **PrimitiveValueNode** (char value)

  Char Value Constructor.

- **PrimitiveValueNode** (short value)

  Short Value Constructor.

- **PrimitiveValueNode** (int value)

  Int Value Constructor.

- **PrimitiveValueNode** (long long value)

  Long Value Constructor.

- **PrimitiveValueNode** (float value)

Float Value Constructor.

- **PrimitiveValueNode** (double value)

  Double Value Constructor.

- **PrimitiveValueNode** (const char *value)

  String Value Constructor.

- **PrimitiveValueNode** (const std::string &value)

  String Value Constructor.

- **PrimitiveValueNode** (const std::vector< unsigned char > &value)

  Byte Array Value Constructor.

- **PrimitiveValueNode** (const **decaf::util::List**< **PrimitiveValueNode** > &value)

  Primtive List Constructor.

- **PrimitiveValueNode** (const **decaf::util::Map**< std::string, **PrimitiveValueNode** > &value)

  Primtive Map Value Constructor.

- **PrimitiveValueNode** (const **PrimitiveValueNode** &node)

  Copy constructor.

- ~**PrimitiveValueNode** ()
- **PrimitiveValueNode** & **operator**= (const **PrimitiveValueNode** &node)

  Assignment operator, copies the data from the other node.

- bool **operator**== (const **PrimitiveValueNode** &node) const

  Comparison Operator, compares this node to the other node.

- **PrimitiveType getType** () const

  Gets the Value Type of this type wrapper.

- **PrimitiveValue getValue** () const

  Gets the internal Primitive Value object from this wrapper.

- void **setValue** (const **PrimitiveValue** &value, **PrimitiveType** valueType)

  Sets the internal PrimitiveVale object to the new value along with the tag for the type that it consists of.

- void **clear** ()

  Clears the value from this wrapper converting it back to a blank NULL_ TYPE value.

- void **setBool** (bool value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- bool **getBool** () const throw (decaf::lang::exceptions::NoSuchElementException)

  Gets the Boolean value of this Node.

- void **setByte** (unsigned char value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- unsigned char **getByte** () const throw (decaf::lang::exceptions::NoSuchElementException)

  Gets the Byte value of this Node.

- void **setChar** (char value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- char **getChar** () const throw (decaf::lang::exceptions::NoSuchElementException)

  Gets the Character value of this Node.

- void **setShort** (short value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- short **getShort** () const throw (decaf::lang::exceptions::NoSuchElementException)

  Gets the Short value of this Node.

- void **setInt** (int value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- int **getInt** () const throw (decaf::lang::exceptions::NoSuchElementException)

  Gets the Integer value of this Node.

- void **setLong** (long long value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- long long **getLong** () const throw (decaf::lang::exceptions::NoSuchElementException)

  Gets the Long value of this Node.

- void **setFloat** (float value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- float **getFloat** () const throw (decaf::lang::exceptions::NoSuchElementException)

  Gets the Float value of this Node.

- void **setDouble** (double value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- double **getDouble** () const throw (decaf::lang::exceptions::NoSuchElementException)

  Gets the Double value of this Node.

- void **setString** (const std::string &value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- std::string **getString** () const throw (decaf::lang::exceptions::NoSuchElementException)

  Gets the String value of this Node.

- void **setByteArray** (const std::vector< unsigned char > &value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- std::vector< unsigned char > **getByteArray** () const throw (decaf::lang::exceptions::NoSuchElementException)

  Gets the Byte Array value of this Node.

- void **setList** (const **decaf::util::List**< **PrimitiveValueNode** > &value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- const **decaf::util::List**< **PrimitiveValueNode** > & **getList** () const throw (decaf::lang::exceptions::NoSuchElementException)

  Gets the Primitive List value of this Node.

- void **setMap** (const **decaf::util::Map**< std::string, **PrimitiveValueNode** > &value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- const **decaf::util::Map**< std::string, **PrimitiveValueNode** > & **getMap** () const throw (decaf::lang::exceptions::NoSuchElementException)

  Gets the Primitive Map value of this Node.

- std::string **toString** () const

  Creates a string representation of this value.

6.525.1 Detailed Description

Class that wraps around a single value of one of the many types. Manages memory for complex types, such as strings. Note: the destructor was left non-virtual so no virtual table will be created. This probably isn't necessary, but will avoid needless memory allocation. Since we'll never extend this class, not having a virtual destructor isn't a concern.

6.525.2 Member Enumeration Documentation

6.525.2.1 enum activemq::util::PrimitiveValueNode::PrimitiveType

Enumeration for the various primitive types.

Enumerator:

NULL_TYPE

BOOLEAN_TYPE
BYTE_TYPE
CHAR_TYPE
SHORT_TYPE
INTEGER_TYPE
LONG_TYPE
DOUBLE_TYPE
FLOAT_TYPE
STRING_TYPE
BYTE_ARRAY_TYPE
MAP_TYPE
LIST_TYPE
BIG_STRING_TYPE

6.525.3 Constructor & Destructor Documentation

6.525.3.1 activemq::util::PrimitiveValueNode::PrimitiveValueNode ()

Default Constructor, creates a value of the NULL_TYPE.

6.525.3.2 activemq::util::PrimitiveValueNode::PrimitiveValueNode (bool *value*)

Boolean Value Constructor.

Parameters:

value - the new value to store.

6.525.3.3 activemq::util::PrimitiveValueNode::PrimitiveValueNode (unsigned char *value*)

Byte Value Constructor.

Parameters:

value - the new value to store.

6.525.3.4 activemq::util::PrimitiveValueNode::PrimitiveValueNode (char *value*)

Char Value Constructor.

Parameters:

value - the new value to store.

6.525.3.5 activemq::util::PrimitiveValueNode::PrimitiveValueNode (short *value*)

Short Value Constructor.

Parameters:

value - the new value to store.

6.525.3.6 activemq::util::PrimitiveValueNode::PrimitiveValueNode (int *value*)

Int Value Constructor.

Parameters:

value - the new value to store.

6.525.3.7 activemq::util::PrimitiveValueNode::PrimitiveValueNode (long long *value*)

Long Value Constructor.

Parameters:

value - the new value to store.

6.525.3.8 activemq::util::PrimitiveValueNode::PrimitiveValueNode (float *value*)

Float Value Constructor.

Parameters:

value - the new value to store.

6.525.3.9 activemq::util::PrimitiveValueNode::PrimitiveValueNode (double *value*)

Double Value Constructor.

Parameters:

value - the new value to store.

6.525.3.10 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const char * *value*)

String Value Constructor.

Parameters:

value - the new value to store.

6.525.3.11 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const std::string & *value*)

String Value Constructor.

Parameters:

value - the new value to store.

6.525.3.12 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const std::vector< unsigned char > & *value*)

Byte Array Value Constructor.

Parameters:

value - the new value to store.

6.525.3.13 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const decaf::util::List< PrimitiveValueNode > & *value*)

Primtive List Constructor.

Parameters:

value - the new value to store.

6.525.3.14 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const decaf::util::Map< std::string, PrimitiveValueNode > & *value*)

Primtive Map Value Constructor.

Parameters:

value - the new value to store.

6.525.3.15 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const PrimitiveValueNode & *node*)

Copy constructor.

Parameters:

node The instance of another node to copy to this one.

6.525.3.16 activemq::util::PrimitiveValueNode::~PrimitiveValueNode () [inline]

6.525.4 Member Function Documentation

6.525.4.1 void activemq::util::PrimitiveValueNode::clear ()

Clears the value from this wrapper converting it back to a blank NULL_TYPE value.

6.525.4.2 bool activemq::util::PrimitiveValueNode::getBool () const throw (decaf::lang::exceptions::NoSuchElementException)

Gets the Boolean value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.3 unsigned char activemq::util::PrimitiveValueNode::getByte () const throw (decaf::lang::exceptions::NoSuchElementException)

Gets the Byte value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.4 std::vector<unsigned char> activemq::util::PrimitiveValueNode::getByteArray () const throw (decaf::lang::exceptions::NoSuchElementException)

Gets the Byte Array value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.5 char activemq::util::PrimitiveValueNode::getChar () const throw (decaf::lang::exceptions::NoSuchElementException)

Gets the Character value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.6 double activemq::util::PrimitiveValueNode::getDouble () const throw (decaf::lang::exceptions::NoSuchElementException)

Gets the Double value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.7 float activemq::util::PrimitiveValueNode::getFloat () const throw (decaf::lang::exceptions::NoSuchElementException)

Gets the Float value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.8 int activemq::util::PrimitiveValueNode::getInt () const throw (decaf::lang::exceptions::NoSuchElementException)

Gets the Integer value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.9 const decaf::util::List<PrimitiveValueNode>& activemq::util::PrimitiveValueNode::getList () const throw (decaf::lang::exceptions::NoSuchElementException)

Gets the Primitive List value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.10 long long activemq::util::PrimitiveValueNode::getLong () const throw (decaf::lang::exceptions::NoSuchElementException)

Gets the Long value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.11 const decaf::util::Map<std::string, PrimitiveValueNode>& activemq::util::PrimitiveValueNode::getMap () const throw (decaf::lang::exceptions::NoSuchElementException)

Gets the Primitive Map value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.12 short activemq::util::PrimitiveValueNode::getShort () const throw (decaf::lang::exceptions::NoSuchElementException)

Gets the Short value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.13 std::string activemq::util::PrimitiveValueNode::getString () const throw (decaf::lang::exceptions::NoSuchElementException)

Gets the String value of this Node.

Returns:

value contained at the given index

Exceptions:

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.14 PrimitiveType activemq::util::PrimitiveValueNode::getType () const [inline]

Gets the Value Type of this type wrapper.

Returns:

the PrimitiveType value for this wrapper.

6.525.4.15 PrimitiveValue activemq::util::PrimitiveValueNode::getValue () const [inline]

Gets the internal Primitive Value object from this wrapper.

Returns:

a copy of the contained **PrimitiveValue** (p. 2551)

6.525.4.16 PrimitiveValueNode& activemq::util::PrimitiveValueNode::operator= (const PrimitiveValueNode & *node*)

Assignment operator, copies the data from the other node.

Parameters:

node The instance of another node to copy to this one.

6.525.4.17 bool activemq::util::PrimitiveValueNode::operator== (const PrimitiveValueNode & *node*) const

Comparison Operator, compares this node to the other node.

Returns:

true if the values are the same false otherwise.

6.525.4.18 void activemq::util::PrimitiveValueNode::setBool (bool *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.525.4.19 void activemq::util::PrimitiveValueNode::setByte (unsigned char *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.525.4.20 void activemq::util::PrimitiveValueNode::setByteArray (const std::vector< unsigned char > & *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.525.4.21 void activemq::util::PrimitiveValueNode::setChar (char *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.525.4.22 void activemq::util::PrimitiveValueNode::setDouble (double *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.525.4.23 void activemq::util::PrimitiveValueNode::setFloat (float *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.525.4.24 void activemq::util::PrimitiveValueNode::setInt (int *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.525.4.25 void activemq::util::PrimitiveValueNode::setList (const decaf::util::List< PrimitiveValueNode > & *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.525.4.26 void activemq::util::PrimitiveValueNode::setLong (long long *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.525.4.27 void activemq::util::PrimitiveValueNode::setMap (const decaf::util::Map< std::string, PrimitiveValueNode > & *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.525.4.28 void activemq::util::PrimitiveValueNode::setShort (short *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.525.4.29 void activemq::util::PrimitiveValueNode::setString (const std::string & *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters:

value - the new value to assign to the element at index

6.525.4.30 void activemq::util::PrimitiveValueNode::setValue (const PrimitiveValue & *value*, PrimitiveType *valueType*)

Sets the internal PrimitiveVale object to the new value along with the tag for the type that it consists of.

Parameters:

value The value to set as the value contained in this Node.

valueType The type of the value being set into this one.

6.525.4.31 std::string activemq::util::PrimitiveValueNode::toString () const

Creates a string representation of this value.

Returns:

string value of this type wrapper.

The documentation for this class was generated from the following file:

6.526 decaf::security::Principal Class Reference

Base interface for a principal, which can represent an individual or organization.

`#include <src/main/decaf/security/Principal.h>`Inheritance diagram for decaf::security::Principal:

Public Member Functions

- virtual ~**Principal** ()
- virtual bool **equals** (const **Principal** &another) const =0

  Compares two principals to see if they are the same.

- virtual std::string **getName** () const =0

  Provides the name of this principal.

6.526.1 Detailed Description

Base interface for a principal, which can represent an individual or organization.

6.526.2 Constructor & Destructor Documentation

6.526.2.1 virtual decaf::security::Principal::~Principal () [inline, virtual]

6.526.3 Member Function Documentation

6.526.3.1 virtual bool decaf::security::Principal::equals (const Principal & *another*) const [pure virtual]

Compares two principals to see if they are the same.

Parameters:

another A principal to be tested for equality to this one.

Returns:

true if the given principal is equivalent to this one.

6.526.3.2 virtual std::string decaf::security::Principal::getName () const [pure virtual]

Provides the name of this principal.

Returns:

the name of this principal.

Implemented in **decaf::security::auth::x500::X500Principal** (p. 3406).

6.527.1 Detailed Description

template<typename E> class decaf::util::PriorityQueue< E >

An unbounded priority queue based on a binary heap algorithm. The elements of the priority queue are ordered according to their natural ordering, or by a **Comparator** (p. 1086) provided to one of the constructors that accepts Comparators. A priority queue relying on natural ordering also does not permit insertion of non-comparable objects (doing so may result in a compiler error).

The head of this queue is the least element with respect to the specified ordering. If multiple elements are tied for least value, the head is one of those elements -- ties are broken arbitrarily. The queue retrieval operations poll, remove, peek, and element access the element at the head of the queue.

A priority queue is unbounded, but has an internal capacity governing the size of an array used to store the elements on the queue. It is always at least as large as the queue size. As elements are added to a priority queue, its capacity grows automatically. The details of the growth policy are not specified.

This class and its iterator implement all of the optional methods of the **Collection** (p. 1054) and **Iterator** (p. 1832) interfaces. The **Iterator** (p. 1832) provided in method **iterator()** (p. 2575) is

not guaranteed to traverse the elements of the priority queue in any particular order. If you need ordered traversal, consider using `Arrays::sort( pq.toArray() )`.

Note that this implementation is not synchronized. Multiple threads should not access a **PriorityQueue** (p. 2571) instance concurrently if any of the threads modifies the queue. Instead, use the thread-safe PriorityBlockingQueue class.

Implementation note: this implementation provides O(log(n)) time for the enqueing and dequeing methods (offer, poll, **remove()** (p. 2577) and add); linear time for the remove(Object) and contains(Object) methods; and constant time for the retrieval methods (peek, element, and size).

Since:

1.0

6.527.2 Constructor & Destructor Documentation

6.527.2.1 template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue () [inline]

Creates a Priority **Queue** (p. 2671) with the default initial capacity.

6.527.2.2 template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (std::size_t *initialCapacity*) [inline]

Creates a Priority **Queue** (p. 2671) with the capacity value supplied.

Parameters:

initialCapacity The initial number of elements allocated to this **PriorityQueue** (p. 2571).

6.527.2.3 template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (std::size_t *initialCapacity*, Comparator< E > * *comparator*) [inline]

Creates a Priority **Queue** (p. 2671) with the default initial capacity. This new **PriorityQueue** (p. 2571) takes ownership of the passed **Comparator** (p. 1086) instance and uses that to determine the ordering of the elements in the **Queue** (p. 2671).

Parameters:

initialCapacity The initial number of elements allocated to this **PriorityQueue** (p. 2571).

comparator The **Comparator** (p. 1086) instance to use in sorting the elements in the **Queue** (p. 2671).

Exceptions:

NullPointerException if the passed **Comparator** (p. 1086) is NULL.

6.527.2.4 template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (const Collection< E > & *source*) [inline]

Creates a **PriorityQueue** (p. 2571) containing the elements in the specified **Collection** (p. 1054).

Parameters:

source the **Collection** (p. 1054) whose elements are to be placed into this priority queue

6.527.2.5 template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (const PriorityQueue< E > & *source*) [inline]

Creates a **PriorityQueue** (p. 2571) containing the elements in the specified priority queue. This priority queue will be ordered according to the same ordering as the given priority queue.

Parameters:

source the priority queue whose elements are to be placed into this priority queue

6.527.2.6 template<typename E> virtual decaf::util::PriorityQueue< E >::~PriorityQueue () [inline, virtual]

6.527.3 Member Function Documentation

6.527.3.1 template<typename E> virtual bool decaf::util::PriorityQueue< E >::add (const E & *value*) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException) [inline, virtual]

Inserts the specified element into this queue if it is possible to do so immediately without violating capacity restrictions, returning true upon success and throwing an IllegalStateException if no space is currently available. This implementation returns true if offer succeeds, else throws an IllegalStateException.

Parameters:

value - the element to offer to the **Queue** (p. 2671).

Returns:

true if the add succeeds.

Exceptions:

IllegalArgumentException if the element cannot be added.

Reimplemented from **decaf::util::AbstractQueue< E >** (p. 163).

References DECAF_CATCH_EXCEPTION_CONVERT, DECAF_CATCH_RETHROW, DECAF_CATCHALL_THROW, and decaf::util::PriorityQueue< E >::offer().

6.527.3.2 template<typename E> virtual void decaf::util::PriorityQueue< E >::clear () throw (lang::exceptions::UnsupportedOperationException) [inline, virtual]

Removes all elements of the queue. This implementation repeatedly invokes poll until it returns the empty marker.

Reimplemented from **decaf::util::AbstractQueue< E >** (p. 164).

6.527.3.3 template<typename E> decaf::lang::Pointer< Comparator<E> > decaf::util::PriorityQueue< E >::comparator () const [inline]

obtains a Copy of the Pointer instance that this **PriorityQueue** (p. 2571) is using to compare the elements in the queue with. The returned value is a copy, the caller cannot change the value if the internal Pointer value.

Returns:

a copy of the **Comparator** (p. 1086) Pointer being used by this **Queue** (p. 2671).

6.527.3.4 template<typename E> virtual decaf::util::Iterator<E>* decaf::util::PriorityQueue< E >::iterator () const [inline, virtual]

Implements **decaf::lang::Iterable< E >** (p. 1830).

6.527.3.5 template<typename E> virtual decaf::util::Iterator<E>* decaf::util::PriorityQueue< E >::iterator () [inline, virtual]

Returns:

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< E >** (p. 1830).

References decaf::util::PriorityQueue< E >::PriorityQueueIterator.

6.527.3.6 template<typename E> virtual bool decaf::util::PriorityQueue< E >::offer (const E & *value*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException) [inline, virtual]

Inserts the specified element into the queue provided that the condition allows such an operation. The method is generally preferable to the collection.add(E), since the latter might throw an exception if the operation fails.

Parameters:

value the specified element to insert into the queue.

Returns:

true if the operation succeeds and false if it fails.

Exceptions:

NullPointerException if the **Queue** (p. 2671) implementation does not allow Null values to be inserted into the **Queue** (p. 2671).

IllegalArgumentException if some property of the specified element prevents it from being added to this queue

Implements **decaf::util::Queue< E >** (p. 2672).

Referenced by decaf::util::PriorityQueue< E >::add().

6.527.3.7 template<typename E> PriorityQueue<E>& decaf::util::PriorityQueue< E >::operator= (const PriorityQueue< E > & *source*) [inline]

Assignment operator, assign another **PriorityQueue** (p. 2571) to this one.

Parameters:

source The **PriorityQueue** (p. 2571) to copy to this one.

6.527.3.8 template<typename E> PriorityQueue<E>& decaf::util::PriorityQueue< E >::operator= (const Collection< E > & *source*) [inline]

Assignment operator, assign another **Collection** (p. 1054) to this one.

Parameters:

source The **Collection** (p. 1054) to copy to this one.

6.527.3.9 template<typename E> virtual bool decaf::util::PriorityQueue< E >::peek (E & *result*) const [inline, virtual]

Gets but not removes the element in the head of the queue. The result if successful is assigned to the result parameter.

Parameters:

result Reference to an instance of the contained type to assigned the removed value to.

Returns:

true if the element at the head of the queue was removed and assigned to the result parameter.

Implements **decaf::util::Queue< E >** (p. 2672).

6.527.3.10 template<typename E> virtual bool decaf::util::PriorityQueue< E >::poll (E & *result*) [inline, virtual]

Gets and removes the element in the head of the queue. If the operation succeeds the value of the element at the head of the **Queue** (p. 2671) is assigned to the result parameter and the method returns true. If the operation fails the method returns false and the value of the result parameter is undefined.

Parameters:

result Reference to an instance of the contained type to assigned the removed value to.

Returns:

true if the element at the head of the queue was removed and assigned to the result parameter.

Implements **decaf::util::Queue< E >** (p. 2673).

6.527.3.11 template<typename E> virtual bool decaf::util::PriorityQueue< E >::remove (const E & *value*) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException) [inline, virtual]

Removes a single instance of the specified element from this collection, if it is present (optional operation). More formally, removes the first element e such that e == o, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Parameters:

value - element to be removed from this collection, if present

Returns:

true if an element was removed as a result of this call

Exceptions:

UnsupportedOperationException if the remove operation is not supported by this collection.

IllegalArgumentException If the value is not a valid entry for this **Collection** (p. 1054).

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 155).

6.527.3.12 template<typename E> virtual E decaf::util::PriorityQueue< E >::remove () throw (decaf::lang::exceptions::NoSuchElementException) [inline, virtual]

Retrieves and removes the head of this queue. This method differs from poll only in that it throws an exception if this queue is empty.

This implementation returns the result of poll unless the queue is empty.

Returns:

a copy of the element in the head of the queue.

Exceptions:

NoSuchElementException if the queue is empty.

Reimplemented from **decaf::util::AbstractQueue< E >** (p. 164).

6.527.3.13 template<typename E> virtual std::size_t decaf::util::PriorityQueue< E >::size () const [inline, virtual]

Returns the number of elements in this collection. If this collection contains more than Integer.MAX_VALUE elements, returns Integer.MAX_VALUE.

Returns:

the number of elements in this collection

Implements **decaf::util::Collection< E >** (p. 1062).

6.527.4 Friends And Related Function Documentation

6.527.4.1 template<typename E> friend class PriorityQueueIterator [friend]

Referenced by decaf::util::PriorityQueue< E >::iterator().

The documentation for this class was generated from the following file:

- src/main/decaf/util/**PriorityQueue.h**

6.528 activemq::commands::ProducerAck Class Reference

`#include <src/main/activemq/commands/ProducerAck.h>`Inheritance diagram for activemq::commands::ProducerAck:

Public Member Functions

- **ProducerAck** ()
- virtual ~**ProducerAck** ()
- virtual unsigned char **getDataStructureType** () const

  Get the unique identifier that this object and its own Marshaler share.

- virtual **ProducerAck** * **cloneDataStructure** () const

  Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

  Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure*** (p. *1461) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure*** (p. *1461) passed in to this one, and returns if they are equivalent.*

- virtual const **Pointer**< **ProducerId** > & **getProducerId** () const
- virtual **Pointer**< **ProducerId** > & **getProducerId** ()
- virtual void **setProducerId** (const **Pointer**< **ProducerId** > &**producerId**)
- virtual int **getSize** () const
- virtual void **setSize** (int **size**)
- virtual bool **isProducerAck** () const
- virtual **Pointer**< **Command** > **visit** (**activemq::state::CommandVisitor** *visitor) throw (exceptions::ActiveMQException)

  Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_PRODUCERACK** = 19

Protected Member Functions

- **ProducerAck** (const **ProducerAck** &)
- **ProducerAck** & **operator**= (const **ProducerAck** &)

Protected Attributes

- **Pointer< ProducerId > producerId**
- int **size**

6.528.1 Constructor & Destructor Documentation

6.528.1.1 activemq::commands::ProducerAck::ProducerAck (const ProducerAck &) [inline, protected]

6.528.1.2 activemq::commands::ProducerAck::ProducerAck ()

6.528.1.3 virtual activemq::commands::ProducerAck::~ProducerAck () [virtual]

6.528.2 Member Function Documentation

6.528.2.1 virtual ProducerAck* activemq::commands::ProducerAck::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.528.2.2 virtual void activemq::commands::ProducerAck::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.528.2.3 virtual bool activemq::commands::ProducerAck::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.528.2.4 virtual unsigned char activemq::commands::ProducerAck::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.528.2.5 virtual Pointer<ProducerId>& activemq::commands::ProducerAck::getProducerId () [virtual]

6.528.2.6 virtual const Pointer<ProducerId>& activemq::commands::ProducerAck::getProducerId () const [virtual]

6.528.2.7 virtual int activemq::commands::ProducerAck::getSize () const [virtual]

6.528.2.8 virtual bool activemq::commands::ProducerAck::isProducerAck () const [inline, virtual]

Returns:

an answer of true to the **isProducerAck()** (p. 2581) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 654).

6.528.2.9 ProducerAck& activemq::commands::ProducerAck::operator= (const ProducerAck &) [inline, protected]

6.528.2.10 virtual void activemq::commands::ProducerAck::setProducerId (const Pointer< ProducerId > & *producerId*) [virtual]

6.528.2.11 virtual void activemq::commands::ProducerAck::setSize (int *size*) [virtual]

6.528.2.12 virtual std::string activemq::commands::ProducerAck::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 655).

6.528.2.13 virtual Pointer<Command> activemq::commands::ProducerAck::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1067).

6.528.3 Field Documentation

6.528.3.1 const unsigned char activemq::commands::ProducerAck::ID_PRODUCERACK = 19 [static]

6.528.3.2 Pointer<ProducerId> activemq::commands::ProducerAck::producerId [protected]

6.528.3.3 int activemq::commands::ProducerAck::size [protected]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**ProducerAck.h**

6.529 activemq::wireformat::openwire::marshal::v2::ProducerAckMarsha Class Reference

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p. 2583).

`#include <src/main/activemq/wireformat/openwire/marshal/v2/ProducerAckMarshaller.h>`Inheritance diagram for activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller:

Public Member Functions

- **ProducerAckMarshaller** ()
- virtual ~**ProducerAckMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.529.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p. 2583). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.529.2 Constructor & Destructor Documentation

6.529.2.1 activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::ProducerAckMarsh () [inline]

6.529.2.2 virtual activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::~ProducerAckMars () [inline, virtual]

6.529.3 Member Function Documentation

6.529.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.529.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::getDataStructureTyp () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.529.3.3 virtual void activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 686).

6.529.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 687).

6.529.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 688).

6.529.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 689).

6.529.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 690).

The documentation for this class was generated from the following file:

6.530.3 Member Function Documentation

6.530.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.530.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::getDataStructureTyp () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.530.3.3 virtual void activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 658).

6.530.3.4 virtual void activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 659).

6.530.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 660).

6.530.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 661).

6.530.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 662).

6.531.3 Member Function Documentation

6.531.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.531.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::getDataStructureTyp () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.531.3.3 virtual void activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 672).

6.531.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 673).

6.531.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 674).

6.531.3.6 virtual void activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 675).

6.531.3.7 virtual void activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 676).

The documentation for this class was generated from the following file:

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.532.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p. 2595). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.532.2 Constructor & Destructor Documentation

6.532.2.1 activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::ProducerAckMarsh () [inline]

6.532.2.2 virtual activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::~ProducerAckMars () [inline, virtual]

6.532.3 Member Function Documentation

6.532.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.532.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::getDataStructureTyp () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.532.3.3 virtual void activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 679).

6.532.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 680).

6.532.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 681).

6.532.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 682).

6.532.3.7 virtual void activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 683).

The documentation for this class was generated from the following file:

6.533.3 Member Function Documentation

6.533.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.533.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::getDataStructureTyp () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.533.3.3 virtual void activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 665).

6.533.3.4 virtual void activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 666).

6.533.3.5 virtual int activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 667).

6.533.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 668).

6.533.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 669).

6.536.2 Constructor & Destructor Documentation

6.536.2.1 activemq::commands::ProducerId::ProducerId ()

6.536.2.2 activemq::commands::ProducerId::ProducerId (const ProducerId & *other*)

6.536.2.3 activemq::commands::ProducerId::ProducerId (const SessionId & *sessionId*, long long *consumerId*) [inline]

References activemq::commands::SessionId::getConnectionId(), and activemq::commands::SessionId::getValue().

6.536.2.4 virtual activemq::commands::ProducerId::~ProducerId () [virtual]

6.536.3 Member Function Documentation

6.536.3.1 virtual ProducerId* activemq::commands::ProducerId::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.536.3.2 virtual int activemq::commands::ProducerId::compareTo (const ProducerId & *value*) const [virtual]

6.536.3.3 virtual void activemq::commands::ProducerId::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Implements **activemq::commands::DataStructure** (p. 1462).

6.536.3.4 virtual bool activemq::commands::ProducerId::equals (const ProducerId & *value*) const [virtual]

6.536.3.5 virtual bool activemq::commands::ProducerId::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1463).

6.536.3.6 virtual std::string& activemq::commands::ProducerId::getConnectionId () [virtual]

6.536.3.7 virtual const std::string& activemq::commands::ProducerId::getConnectionId () const [virtual]

6.536.3.8 virtual unsigned char activemq::commands::ProducerId::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.536.3.9 const Pointer<SessionId>& activemq::commands::ProducerId::getParentId () const

6.536.3.10 virtual long long activemq::commands::ProducerId::getSessionId () const [virtual]

6.537.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.537.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.537.3.3 virtual void activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.537.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.537.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.537.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.537.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

6.538.3 Member Function Documentation

6.538.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.538.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.538.3.3 virtual void activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.538.3.4 virtual void activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.538.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.538.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.538.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

6.541.3 Member Function Documentation

6.541.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.541.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.541.3.3 virtual void activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.541.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.541.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.541.3.6 virtual void activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.541.3.7 virtual void activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v4/**ProducerIdMarshaller.h**

6.542 activemq::commands::ProducerInfo Class Reference

`#include <src/main/activemq/commands/ProducerInfo.h>`Inheritance diagram for activemq::commands::ProducerInfo:

Public Member Functions

- **ProducerInfo** ()
- virtual ~**ProducerInfo** ()
- virtual unsigned char **getDataStructureType** () const

  Get the unique identifier that this object and its own Marshaler share.

- virtual **ProducerInfo** * **cloneDataStructure** () const

  Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

  Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure*** (p. *1461*) *such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure*** (p. *1461*) *passed in to this one, and returns if they are equivalent.*

- virtual const **Pointer**< **ProducerId** > & **getProducerId** () const
- virtual **Pointer**< **ProducerId** > & **getProducerId** ()
- virtual void **setProducerId** (const **Pointer**< **ProducerId** > &**producerId**)
- virtual const **Pointer**< **ActiveMQDestination** > & **getDestination** () const
- virtual **Pointer**< **ActiveMQDestination** > & **getDestination** ()
- virtual void **setDestination** (const **Pointer**< **ActiveMQDestination** > &**destination**)

6.542.1 Constructor & Destructor Documentation

6.542.1.1 activemq::commands::ProducerInfo::ProducerInfo (const ProducerInfo &) [inline, protected]

6.542.1.2 activemq::commands::ProducerInfo::ProducerInfo ()

6.542.1.3 virtual activemq::commands::ProducerInfo::~ProducerInfo () [virtual]

6.542.2 Member Function Documentation

6.542.2.1 virtual ProducerInfo* activemq::commands::ProducerInfo::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.542.2.2 virtual void activemq::commands::ProducerInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.542.2.3 virtual bool activemq::commands::ProducerInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.542.2.4 virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ProducerInfo::getBrokerPath () [virtual]

6.542.2.5 virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ProducerInfo::getBrokerPath () const [virtual]

6.542.2.6 virtual unsigned char activemq::commands::ProducerInfo::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.542.2.7 virtual Pointer<ActiveMQDestination>& activemq::commands::ProducerInfo::getDestination () [virtual]

6.542.2.8 virtual const Pointer<ActiveMQDestination>& activemq::commands::ProducerInfo::getDestination () const [virtual]

6.542.2.9 virtual Pointer<ProducerId>& activemq::commands::ProducerInfo::getProducerId () [virtual]

6.542.2.10 virtual const Pointer<ProducerId>& activemq::commands::ProducerInfo::getProducerId () const [virtual]

6.542.2.11 virtual int activemq::commands::ProducerInfo::getWindowSize () const [virtual]

6.542.2.12 virtual bool activemq::commands::ProducerInfo::isDispatchAsync () const [virtual]

6.542.2.13 virtual bool activemq::commands::ProducerInfo::isProducerInfo () const [inline, virtual]

Returns:

an answer of true to the **isProducerInfo()** (p. 2634) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 654).

6.542.2.14 ProducerInfo& activemq::commands::ProducerInfo::operator= (const ProducerInfo &) [inline, protected]

6.542.2.15 virtual void activemq::commands::ProducerInfo::setBrokerPath (const std::vector< decaf::lang::Pointer< BrokerId > > & *brokerPath*) [virtual]

6.542.2.16 virtual void activemq::commands::ProducerInfo::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.542.2.17 virtual void activemq::commands::ProducerInfo::setDispatchAsync (bool *dispatchAsync*) [virtual]

6.542.2.18 virtual void activemq::commands::ProducerInfo::setProducerId (const Pointer< ProducerId > & *producerId*) [virtual]

6.542.2.19 virtual void activemq::commands::ProducerInfo::setWindowSize (int *windowSize*) [virtual]

6.542.2.20 virtual std::string activemq::commands::ProducerInfo::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 655).

6.542.2.21 virtual Pointer<Command> activemq::commands::ProducerInfo::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1067).

6.542.3 Field Documentation

6.542.3.1 std::vector< decaf::lang::Pointer<BrokerId> > activemq::commands::ProducerInfo::brokerPath [protected]

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.543.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerInfoMarshaller** (p. 2636). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.543.2 Constructor & Destructor Documentation

6.543.2.1 activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::ProducerInfoMarsh () [inline]

6.543.2.2 virtual activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::~ProducerInfoMar () [inline, virtual]

6.543.3 Member Function Documentation

6.543.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.543.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::getDataStructureTyp () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.543.3.3 virtual void activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 686).

6.543.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 687).

6.543.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 688).

6.543.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 689).

6.543.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 690).

The documentation for this class was generated from the following file:

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 660).

6.544.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 661).

6.544.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 662).

6.545.3 Member Function Documentation

6.545.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ProducerInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.545.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::ProducerInfoMarshaller::getDataStructureTyp () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.545.3.3 virtual void activemq::wireformat::openwire::marshal::v5::ProducerInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 679).

6.545.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ProducerInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 680).

6.545.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ProducerInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 681).

6.545.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ProducerInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 682).

6.545.3.7 virtual void activemq::wireformat::openwire::marshal::v5::ProducerInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 683).

Marshaling code for Open Wire Format for **ProducerInfoMarshaller** (p. 2648).

`#include <src/main/activemq/wireformat/openwire/marshal/v4/ProducerInfoMarshaller.h>`Inheritance diagram for activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller:

Public Member Functions

- **ProducerInfoMarshaller** ()
- virtual ~**ProducerInfoMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.546.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerInfoMarshaller** (p. 2648). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.546.2 Constructor & Destructor Documentation

6.546.2.1 activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::ProducerInfoMarsh () [inline]

6.546.2.2 virtual activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::~ProducerInfoMar () [inline, virtual]

6.546.3 Member Function Documentation

6.546.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.546.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::getDataStructureTyp () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.546.3.3 virtual void activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 672).

6.546.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 673).

6.546.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 674).

6.546.3.6 virtual void activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 675).

6.546.3.7 virtual void activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 676).

6.547.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.547.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::getDataStructureTyp () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.547.3.3 virtual void activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 665).

6.547.3.4 virtual void activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 666).

6.547.3.5 virtual int activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 667).

6.547.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 668).

6.547.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 669).

6.549 decaf::util::Properties Class Reference

Java-like properties class for mapping string names to string values.

`#include <src/main/decaf/util/Properties.h>`

Public Member Functions

- **Properties** ()
- **Properties** (const **Properties** &src)
- virtual ~**Properties** ()
- **Properties** & **operator**= (const **Properties** &src)

  Assignment Operator.

- bool **isEmpty** () const

  Returns true if the properties object is empty.

- std::size_t **size** () const
- const char * **getProperty** (const std::string &name) const

  Looks up the value for the given property.

- std::string **getProperty** (const std::string &name, const std::string &defaultValue) const

  Looks up the value for the given property.

- void **setProperty** (const std::string &name, const std::string &value)

  Sets the value for a given property.

- bool **hasProperty** (const std::string &name) const

  Check to see if the Property exists in the set.

- void **remove** (const std::string &name)

  Removes the property with the given name.

- std::vector< std::pair< std::string, std::string > > **toArray** () const

  Method that serializes the contents of the property map to an array.

- void **copy** (const **Properties** &source)

  *Copies the contents of the given properties object to this one, if the given **Properties** (p. 2657) instance in NULL then this **List** (p. 1984) is not modified.*

- **Properties** * **clone** () const

  Clones this object.

- void **clear** ()

  Clears all properties from the map.

- bool **equals** (const **Properties** &source) const

  *Test whether two **Properties** (p. 2657) objects are equivalent.*

- std::string **toString** () const

*Formats the contents of the **Properties** (p. 2657) Object into a string that can be logged, etc.*

- void **load** (**decaf::io::InputStream** *stream) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)

  Reads a property list (key and element pairs) from the input byte stream.

- void **load** (**decaf::io::Reader** *reader) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)

  Reads a property list (key and element pairs) from the input character stream in a simple line-oriented format.

- void **store** (**decaf::io::OutputStream** *out, const std::string &comment) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)

  *Writes this property list (key and element pairs) in this **Properties** (p. 2657) table to the output stream in a format suitable for loading into a **Properties** (p. 2657) table using the load(InputStream) method.*

- void **store** (**decaf::io::Writer** *writer, const std::string &comments) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)

  *Writes this property list (key and element pairs) in this **Properties** (p. 2657) table to the output character stream in a format that can be read by the load(Reader) method.*

Protected Attributes

- std::auto_ptr< **Properties** > **defaults**

  Default list used to answer for any keys not found in the properties list, can be filled in by another implementation of this class.

6.549.1 Detailed Description

Java-like properties class for mapping string names to string values. The **Properties** (p. 2657) list contains a key value pair of properties that can be loaded and stored to a stream. Each **Properties** (p. 2657) instance can contain an internal **Properties** (p. 2657) list that contains default values for keys not found in the **Properties** (p. 2657) **List** (p. 1984).

The **Properties** (p. 2657) list if a Thread Safe class, it can be shared amongst objects in multiple threads without the need for additional synchronization.

Since:

1.0

6.549.2 Constructor & Destructor Documentation

6.549.2.1 decaf::util::Properties::Properties ()

6.549.2.2 decaf::util::Properties::Properties (const Properties & *src*)

6.549.2.3 virtual decaf::util::Properties::~Properties () [virtual]

6.549.3 Member Function Documentation

6.549.3.1 void decaf::util::Properties::clear ()

Clears all properties from the map.

6.549.3.2 Properties* decaf::util::Properties::clone () const

Clones this object.

Returns:

a replica of this object.

6.549.3.3 void decaf::util::Properties::copy (const Properties & *source*)

Copies the contents of the given properties object to this one, if the given **Properties** (p. 2657) instance in NULL then this **List** (p. 1984) is not modified.

Parameters:

source The source properties object.

6.549.3.4 bool decaf::util::Properties::equals (const Properties & *source*) const

Test whether two **Properties** (p. 2657) objects are equivalent. Two **Properties** (p. 2657) Objects are considered equivalent when they each contain the same number of elements and each key / value pair contained within the two are equal.

This comparison does not check the contents of the Defaults instance.

Parameters:

source The **Properties** (p. 2657) object to compare this instance to.

Returns:

true if the contents of the two **Properties** (p. 2657) objects are the same.

6.549.3.5 std::string decaf::util::Properties::getProperty (const std::string & *name*, const std::string & *defaultValue*) const

Looks up the value for the given property.

Parameters:

name the name of the property to be looked up.

defaultValue The value to be returned if the given property does not exist.

Returns:

The value of the property specified by `name`, if it exists, otherwise the `defaultValue`.

6.549.3.6 const char* decaf::util::Properties::getProperty (const std::string & *name*) const

Looks up the value for the given property.

Parameters:

name The name of the property to be looked up.

Returns:

the value of the property with the given name, if it exists. If it does not exist, returns NULL.

Referenced by decaf::util::logging::LogManager::getProperty().

6.549.3.7 bool decaf::util::Properties::hasProperty (const std::string & *name*) const

Check to see if the Property exists in the set.

Parameters:

name - property name to check for in this properties set.

Returns:

true if property exists, false otherwise.

6.549.3.8 bool decaf::util::Properties::isEmpty () const

Returns true if the properties object is empty.

Returns:

true if empty

6.549.3.9 void decaf::util::Properties::load (decaf::io::Reader * *reader*) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)

Reads a property list (key and element pairs) from the input character stream in a simple line-oriented format. **Properties** (p. 2657) are processed in terms of lines. There are two kinds of line, natural lines and logical lines. A natural line is defined as a line of characters that is terminated either by a set of line terminator characters (

or or

) or by the end of the stream. A natural line may be either a blank line, a comment line, or hold all or some of a key-element pair. A logical line holds all the data of a key-element pair, which may be spread out across several adjacent natural lines by escaping the line terminator sequence with a backslash character \. Note that a comment line cannot be extended in this manner; every natural line that is a comment must have its own comment indicator, as described below. Lines are read from input until the end of the stream is reached.

A natural line that contains only white space characters is considered blank and is ignored. A comment line has an ASCII '#' or '!' as its first non-white space character; comment lines are also ignored and do not encode key-element information. In addition to line terminators, this format considers the characters space (' '), tab ('), and form feed (') to be white space.

If a logical line is spread across several natural lines, the backslash escaping the line terminator sequence, the line terminator sequence, and any white space at the start of the following line have no affect on the key or element values. The remainder of the discussion of key and element parsing (when loading) will assume all the characters constituting the key and element appear on a single natural line after line continuation characters have been removed. Note that it is not sufficient to only examine the character preceding a line terminator sequence to decide if the line terminator is escaped; there must be an odd number of contiguous backslashes for the line terminator to be escaped. Since the input is processed from left to right, a non-zero even number of 2n contiguous backslashes before a line terminator (or elsewhere) encodes n backslashes after escape processing.

The key contains all of the characters in the line starting with the first non-white space character and up to, but not including, the first unescaped '=', ':', or white space character other than a line terminator. All of these key termination characters may be included in the key by escaping them with a preceding backslash character; for example,

\:\=

would be the two-character key ":=". Line terminator characters can be included using and

escape sequences. Any white space after the key is skipped; if the first non-white space character after the key is '=' or ':', then it is ignored and any white space characters after it are also skipped. All remaining characters on the line become part of the associated element string; if there are no remaining characters, the element is the empty string "". Once the raw character sequences constituting the key and element are identified, escape processing is performed as described above.

As an example, each of the following three lines specifies the key "Truth" and the associated element value "Beauty":

Truth = Beauty Truth:Beauty Truth :Beauty

As another example, the following three lines specify a single property:

fruits apple, banana, pear, \ cantaloupe, watermelon, \ kiwi, mango

The key is "fruits" and the associated element is: "apple, banana, pear, cantaloupe, watermelon, kiwi, mango"

Note that a space appears before each \ so that a space will appear after each comma in the final result; the \, line terminator, and leading white space on the continuation line are merely discarded and are not replaced by one or more other characters.

As a third example, the line:

cheeses

specifies that the key is "cheeses" and the associated element is the empty string "".

Characters in keys and elements can be represented in escape sequences similar to those used

for character and string literals (see §3.3 and §3.10.6 of the Java Language Specification). The differences from the character escape sequences and Unicode escapes used for characters and strings are:

- Octal escapes are not recognized.
- The character sequence **does** not represent a backspace character.
- The method does not treat a backslash character, \, before a non-valid escape character as an error; the backslash is silently dropped. For example, in a C++ string the sequence "\z" would cause a compile time error. In contrast, this method silently drops the backslash. Therefore, this method treats the two character sequence "\b" as equivalent to the single character 'b'.
- Escapes are not necessary for single and double quotes; however, by the rule above, single and double quote characters preceded by a backslash still yield single and double quote characters, respectively.

This method does not close the Reader upon its return.

Parameters:

reader The Reader that provides an character stream as input.

Exceptions:

IOException if there is an error while reading from the stream.

IllegalArgumentException if malformed data is found while reading the properties.

NullPointerException if the passed stream is Null.

6.549.3.10 void decaf::util::Properties::load (decaf::io::InputStream * *stream*) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)

Reads a property list (key and element pairs) from the input byte stream. The input stream is in a simple line-oriented format as specified in load(Reader) and is assumed to use the ISO 8859-1 character encoding.

This method does not close the stream upon its return.

Parameters:

stream The stream to read the properties data from.

Exceptions:

IOException if there is an error while reading from the stream.

IllegalArgumentException if malformed data is found while reading the properties.

NullPointerException if the passed stream is Null.

6.549.3.11 Properties& decaf::util::Properties::operator= (const Properties & *src*)

Assignment Operator.

Parameters:

src The **Properties** (p. 2657) list to copy to this **List** (p. 1984).

Returns:

a reference to this **List** (p. 1984) for use in chaining.

6.549.3.12 void decaf::util::Properties::remove (const std::string & *name*)

Removes the property with the given name.

Parameters:

name the name of the property to remove.

6.549.3.13 void decaf::util::Properties::setProperty (const std::string & *name*, const std::string & *value*)

Sets the value for a given property. If the property already exists, overwrites the value.

Parameters:

name The name of the value to be written.

value The value to be written.

6.549.3.14 std::size_t decaf::util::Properties::size () const

Returns:

The number of **Properties** (p. 2657) in this **Properties** (p. 2657) Object.

6.549.3.15 void decaf::util::Properties::store (decaf::io::Writer * *writer*, const std::string & *comments*) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)

Writes this property list (key and element pairs) in this **Properties** (p. 2657) table to the output character stream in a format that can be read by the load(Reader) method. **Properties** (p. 2657) from the defaults table of this **Properties** (p. 2657) table (if any) are not written out by this method.

If the comments argument is not empty, then an ASCII # character, the comments string, and a line separator are first written to the output stream. Thus, the comments can serve as an identifying comment. Any one of a line feed (’

’), a carriage return (”), or a carriage return followed immediately by a line feed in comments is replaced by a line separator generated by the Writer and if the next character in comments is not character # or character ! then an ASCII # is written out after that line separator.

Next, a comment line is always written, consisting of an ASCII # character, the current date and time (as if produced by the toString method of **Date** (p. 1467) for the current time), and a line separator as generated by the Writer.

Then every entry in this **Properties** (p. 2657) table is written out, one per line. For each entry the key string is written, then an ASCII =, then the associated element string. For the key, all space characters are written with a preceding \ character. For the element, leading space characters, but not embedded or trailing space characters, are written with a preceding \ character. The key and element characters #, !, =, and : are written with a preceding backslash to ensure that they are properly loaded.

After the entries have been written, the output stream is flushed. The output stream remains open after this method returns.

Parameters:

writer The Writer instance to use to output the properties.

comments A description of these properties that is written before writing the properties.

Exceptions:

IOException if there is an error while writing from the stream.

NullPointerException if the passed stream is Null.

6.549.3.16 void decaf::util::Properties::store (decaf::io::OutputStream * *out*, const std::string & *comment*) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)

Writes this property list (key and element pairs) in this **Properties** (p. 2657) table to the output stream in a format suitable for loading into a **Properties** (p. 2657) table using the load(InputStream) method. **Properties** (p. 2657) from the defaults table of this **Properties** (p. 2657) table (if any) are not written out by this method.

This method outputs the comments, properties keys and values in the same format as specified in store(Writer), with the following differences:

- The stream is written using the ISO 8859-1 character encoding.
- Characters not in Latin-1 in the comments are written as for their appropriate unicode hexadecimal value xxxx.
- Characters less than and characters greater than in property keys or values are written as for the appropriate hexadecimal value xxxx.

After the entries have been written, the output stream is flushed. The output stream remains open after this method returns.

Parameters:

out The OutputStream instance to write the properties to.

comment A description of these properties that is written to the output stream.

Exceptions:

IOException if there is an error while writing from the stream.

NullPointerException if the passed stream is Null.

6.549.3.17 std::vector< std::pair< std::string, std::string > > decaf::util::Properties::toArray () const

Method that serializes the contents of the property map to an array.

Returns:

list of pairs where the first is the name and the second is the value.

6.549.3.18 std::string decaf::util::Properties::toString () const

Formats the contents of the **Properties** (p. 2657) Object into a string that can be logged, etc.

Returns:

string value of this object.

6.549.4 Field Documentation

6.549.4.1 std::auto_ptr<Properties> decaf::util::Properties::defaults [protected]

Default list used to answer for any keys not found in the properties list, can be filled in by another implementation of this class.

The documentation for this class was generated from the following file:

- src/main/decaf/util/**Properties.h**

6.550 decaf::util::logging::PropertiesChangeListener Class Reference

Defines the interface that classes can use to listen for change events on **Properties** (p. 2657).

`#include <src/main/decaf/util/logging/PropertiesChangeListener.h>`

Public Member Functions

- virtual ~**PropertiesChangeListener** ()
- virtual void **onPropertyChanged** (const std::string &name, const std::string &oldValue, const std::string &newValue)=0

  Change Event, called when a property is changed.

6.550.1 Detailed Description

Defines the interface that classes can use to listen for change events on **Properties** (p. 2657).

6.550.2 Constructor & Destructor Documentation

6.550.2.1 virtual decaf::util::logging::PropertiesChangeListener::~PropertiesChangeListener () [inline, virtual]

6.550.3 Member Function Documentation

6.550.3.1 virtual void decaf::util::logging::PropertiesChangeListener::onPropertyChanged (const std::string & *name*, const std::string & *oldValue*, const std::string & *newValue*) [pure virtual]

Change Event, called when a property is changed.

Parameters:

name - Name of the Property

oldValue - Old Value of the Property

newValue - New Value of the Property

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**PropertiesChangeListener.h**

6.551 decaf::net::ProtocolException Class Reference

  Copy Constructor.
- **ProtocolException** (const char *file, const int lineNumber, const std::exception ***cause**, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- **ProtocolException** (const std::exception ***cause**) throw ()
  Constructor.
- **ProtocolException** (const char *file, const int lineNumber, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **ProtocolException** * **clone** () const
  Clones this exception.
- virtual ~**ProtocolException** () throw ()

6.551.1 Constructor & Destructor Documentation

6.551.1.1 decaf::net::ProtocolException::ProtocolException () throw () [inline]

Default Constructor.

6.551.1.2 decaf::net::ProtocolException::ProtocolException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.551.1.3 decaf::net::ProtocolException::ProtocolException (const ProtocolException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.551.1.4 decaf::net::ProtocolException::ProtocolException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.551.1.5 decaf::net::ProtocolException::ProtocolException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.551.1.6 decaf::net::ProtocolException::ProtocolException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.551.1.7 virtual decaf::net::ProtocolException::~ProtocolException () throw () [inline, virtual]

6.551.2 Member Function Documentation

6.551.2.1 virtual ProtocolException* decaf::net::ProtocolException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1822).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**ProtocolException.h**

6.552 decaf::security::PublicKey Class Reference

A public key.

6.553 decaf::util::Queue< E > Class Template Reference

A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection.

`#include <src/main/decaf/util/Queue.h>`Inheritance diagram for decaf::util::Queue< E >:

Public Member Functions

- virtual ~**Queue** ()
- virtual bool **offer** (const E &value)=0 throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException)

  Inserts the specified element into the queue provided that the condition allows such an operation.

- virtual bool **poll** (E &result)=0

  Gets and removes the element in the head of the queue.

- virtual E **remove** ()=0 throw (decaf::lang::exceptions::NoSuchElementException)

  Gets and removes the element in the head of the queue.

- virtual bool **peek** (E &result) const =0

  Gets but not removes the element in the head of the queue.

- virtual E **element** () const =0 throw (decaf::lang::exceptions::NoSuchElementException)

  Gets but not removes the element in the head of the queue.

6.553.1 Detailed Description

template<typename E> class decaf::util::Queue< E >

A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection. Generally, a queue orders its elements by means of first-in-first-out. While priority queue orders its elements according to a comparator specified or the elements' natural order. Furthermore, a stack orders its elements last-in-first out.

Queue (p. 2671) does not provide blocking queue methods, which will block until the operation of the method is allowed. BlockingQueue interface defines such methods.

Unlike the Java **Queue** (p. 2671) interface the methods of this class cannot return null to indicate that a **Queue** (p. 2671) is empty since null has no meaning for elements such as classes, structs and primitive types and cannot be used in a meaningful way to check for an empty queue. Methods that would have returned null in the Java **Queue** (p. 2671) interface have been altered to return a boolean value indicating if the operation succeeded and take single argument that is a reference to the location where the returned value is to be assigned. This implies that elements in the **Queue** (p. 2671) must be *assignable* in order to utilize these methods.

Since:

1.0

6.553.2 Constructor & Destructor Documentation

6.553.2.1 template<typename E > virtual decaf::util::Queue< E >::~Queue () [inline, virtual]

6.553.3 Member Function Documentation

6.553.3.1 template<typename E > virtual E decaf::util::Queue< E >::element () const throw (decaf::lang::exceptions::NoSuchElementException) [pure virtual]

Gets but not removes the element in the head of the queue. Throws a NoSuchElementException if there is no element in the queue.

Returns:

the element in the head of the queue.

Exceptions:

NoSuchElementException if there is no element in the queue.

Implemented in **decaf::util::AbstractQueue< E >** (p. 164).

6.553.3.2 template<typename E > virtual bool decaf::util::Queue< E >::offer (const E & *value*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException) [pure virtual]

Inserts the specified element into the queue provided that the condition allows such an operation. The method is generally preferable to the collection.add(E), since the latter might throw an exception if the operation fails.

Parameters:

value the specified element to insert into the queue.

Returns:

true if the operation succeeds and false if it fails.

Exceptions:

NullPointerException if the **Queue** (p. 2671) implementation does not allow Null values to be inserted into the **Queue** (p. 2671).

IllegalArgumentException if some property of the specified element prevents it from being added to this queue

Implemented in **decaf::util::PriorityQueue< E >** (p. 2575).

Referenced by decaf::util::AbstractQueue< E >::add().

6.553.3.3 template<typename E > virtual bool decaf::util::Queue< E >::peek (E & *result*) const [pure virtual]

Gets but not removes the element in the head of the queue. The result if successful is assigned to the result parameter.

Parameters:

result Reference to an instance of the contained type to assigned the removed value to.

Returns:

true if the element at the head of the queue was removed and assigned to the result parameter.

Implemented in **decaf::util::PriorityQueue< E >** (p. 2576).

Referenced by decaf::util::AbstractQueue< E >::element().

6.553.3.4 template<typename E > virtual bool decaf::util::Queue< E >::poll (E & *result*) [pure virtual]

Gets and removes the element in the head of the queue. If the operation succeeds the value of the element at the head of the **Queue** (p. 2671) is assigned to the result parameter and the method returns true. If the operation fails the method returns false and the value of the result parameter is undefined.

Parameters:

result Reference to an instance of the contained type to assigned the removed value to.

Returns:

true if the element at the head of the queue was removed and assigned to the result parameter.

Implemented in **decaf::util::PriorityQueue< E >** (p. 2576).

Referenced by decaf::util::AbstractQueue< E >::clear(), and decaf::util::AbstractQueue< E >::remove().

6.553.3.5 template<typename E > virtual E decaf::util::Queue< E >::remove () throw (decaf::lang::exceptions::NoSuchElementException) [pure virtual]

Gets and removes the element in the head of the queue. Throws a NoSuchElementException if there is no element in the queue.

Returns:

the element in the head of the queue.

Exceptions:

NoSuchElementException if there is no element in the queue.

Implemented in **decaf::util::AbstractQueue< E >** (p. 164), and **decaf::util::PriorityQueue< E >** (p. 2577).

The documentation for this class was generated from the following file:

- src/main/decaf/util/**Queue.h**

6.554 cms::Queue Class Reference

An interface encapsulating a provider-specific queue name.

`#include <src/main/cms/Queue.h>`Inheritance diagram for cms::Queue:

Public Member Functions

- virtual ~**Queue** ()
- virtual std::string **getQueueName** () const =0 throw (CMSException)

  Gets the name of this queue.

6.554.1 Detailed Description

An interface encapsulating a provider-specific queue name. Messages sent to a **Queue** (p. 2674) are sent to a Single Subscriber on that **Queue** (p. 2674) **Destination** (p. 1480). This allows for Queues to be used as load balances implementing a SEDA based architecture. The length of time that a Provider will store a **Message** (p. 2163) in a **Queue** (p. 2674) is not defined by the CMS API, consult your Provider documentation for this information.

Since:

1.0

6.554.2 Constructor & Destructor Documentation

6.554.2.1 virtual cms::Queue::~Queue () `[inline, virtual]`

6.554.3 Member Function Documentation

6.554.3.1 virtual std::string cms::Queue::getQueueName () const throw (CMSException) `[pure virtual]`

Gets the name of this queue.

Returns:

The queue name.

Exceptions:

CMSException *(*p. ***1031***) - If an internal error occurs.

Implemented in **activemq::commands::ActiveMQQueue** (p. 422).

The documentation for this class was generated from the following file:

- src/main/cms/**Queue.h**

6.555 cms::QueueBrowser Class Reference

This class implements in interface for browsing the messages in a **Queue** (p. 2674) without removing them.

`#include <src/main/cms/QueueBrowser.h>`Inheritance diagram for cms::QueueBrowser:

Public Member Functions

- virtual ~**QueueBrowser** ()
- virtual const **Queue** * **getQueue** () const =0 throw (cms::CMSException)
- virtual std::string **getMessageSelector** () const =0 throw (cms::CMSException)
- virtual std::vector< const **cms::Message** * > **getEnumeration** () const =0 throw (cms::CMSException)

  Gets an enumeration for browsing the current queue messages in the order they would be received.

6.555.1 Detailed Description

This class implements in interface for browsing the messages in a **Queue** (p. 2674) without removing them. The `getEnumeration` method of this class returns a static snapshot of the **Queue** (p. 2674) at the time the method is called. Since new Message's can be arriving and old Message's could expire the client should periodically refresh its view by calling `getEnumeration` again.

Since:

1.1

6.555.2 Constructor & Destructor Documentation

6.555.2.1 virtual cms::QueueBrowser::~QueueBrowser () [inline, virtual]

6.555.3 Member Function Documentation

6.555.3.1 virtual std::vector<const cms::Message*> cms::QueueBrowser::getEnumeration () const throw (cms::CMSException) [pure virtual]

Gets an enumeration for browsing the current queue messages in the order they would be received. The enumeration returned is a static view of the **Queue** (p. 2674) and is not updated as new Messages arrive, the client should refresh its enumeration by calling this method again.

Returns:

an STL vector for browsing the messages.

Exceptions:

CMSException *(*p. ***1031****)* if an internal error occurs.

6.555.3.2 virtual std::string cms::QueueBrowser::getMessageSelector () const throw (cms::CMSException) [pure virtual]

Returns:

the MessageSelector that is used on when this browser was created or empty string if no selector was present.

Exceptions:

CMSException *(*p. ***1031)*** if an internal error occurs.

6.555.3.3 virtual const Queue* cms::QueueBrowser::getQueue () const throw (cms::CMSException) [pure virtual]

Returns:

the **Queue** (p. 2674) that this browser is listening on.

Exceptions:

CMSException *(*p. ***1031)*** if an internal error occurs.

The documentation for this class was generated from the following file:

- src/main/cms/**QueueBrowser.h**

6.556 decaf::util::Random Class Reference

Random (p. 2677) Value Generator which is used to generate a stream of pseudorandom numbers.

`#include <src/main/decaf/util/Random.h>`

Public Member Functions

- **Random** ()

  Construct a random generator with the current time of day in milliseconds as the initial state.

- **Random** (unsigned long long seed)

  Construct a random generator with the given `seed` *as the initial state.*

- bool **nextBoolean** ()

  Answers the next pseudo-random, uniformly distributed boolean value generated by this generator.

- void **nextBytes** (std::vector< unsigned char > &buf)

  Modifies the byte array by a random sequence of bytes generated by this random number generator.

- double **nextDouble** ()

  Generates a normally distributed random double number between 0.0 inclusively and 1.0 exclusively.

- float **nextFloat** ()

  Generates a normally distributed random float number between 0.0 inclusively and 1.0 exclusively.

- double **nextGaussian** ()

  Pseudo-randomly generates (approximately) a normally distributed `double` *value with mean 0.0 and a standard deviation value of* `1.0` *using the polar method of G.*

- int **nextInt** ()

  Generates a uniformly distributed 32-bit `int` *value from the this random number sequence.*

- int **nextInt** (int n) throw (lang::exceptions::IllegalArgumentException)

  Returns to the caller a new pseudo-random integer value which is uniformly distributed between 0 (inclusively) and the value of `n` *(exclusively).*

- long long **nextLong** ()

  Generates a uniformly distributed 64-bit `int` *value from the this random number sequence.*

- void **setSeed** (unsigned long long seed)

  Modifies the seed using linear congruential formula presented in The Art of Computer Programming, Volume 2, Section 3.2.1.

Protected Member Functions

- virtual int **next** (int bits)

  Answers a pseudo-random uniformly distributed `int` *value of the number of bits specified by the argument* `bits` *as described by Donald E.*

6.556.1 Detailed Description

Random (p. 2677) Value Generator which is used to generate a stream of pseudorandom numbers. The algorithms implemented by class **Random** (p. 2677) use a protected utility method that on each invocation can supply up to 32 pseudorandomly generated bits.

Since:

1.0

6.556.2 Constructor & Destructor Documentation

6.556.2.1 decaf::util::Random::Random ()

Construct a random generator with the current time of day in milliseconds as the initial state.

See also:

setSeed (p. 2681)

6.556.2.2 decaf::util::Random::Random (unsigned long long *seed*)

Construct a random generator with the given `seed` as the initial state.

Parameters:

seed the seed that will determine the initial state of this random number generator

See also:

setSeed (p. 2681)

6.556.3 Member Function Documentation

6.556.3.1 virtual int decaf::util::Random::next (int *bits*) [protected, virtual]

Answers a pseudo-random uniformly distributed `int` value of the number of bits specified by the argument `bits` as described by Donald E. Knuth in *The Art of Computer Programming, Volume 2: Seminumerical Algorithms*, section 3.2.1.

Returns:

int a pseudo-random generated int number

Parameters:

bits number of bits of the returned value

See also:

nextBytes (p. 2679)
nextDouble (p. 2679)
nextFloat (p. 2679)
nextInt() (p. 2680)

nextInt(int) (p. 2680)
nextGaussian (p. 2680)
nextLong (p. 2680)

6.556.3.2 bool decaf::util::Random::nextBoolean ()

Answers the next pseudo-random, uniformly distributed boolean value generated by this generator.

Returns:

boolean a pseudo-random, uniformly distributed boolean value

6.556.3.3 void decaf::util::Random::nextBytes (std::vector< unsigned char > & *buf*)

Modifies the byte array by a random sequence of bytes generated by this random number generator.

Parameters:

buf non-null array to contain the new random bytes

See also:

next (p. 2678)

6.556.3.4 double decaf::util::Random::nextDouble ()

Generates a normally distributed random double number between 0.0 inclusively and 1.0 exclusively.

Returns:

double

See also:

nextFloat (p. 2679)

6.556.3.5 float decaf::util::Random::nextFloat ()

Generates a normally distributed random float number between 0.0 inclusively and 1.0 exclusively.

Returns:

float a random float number between 0.0 and 1.0

See also:

nextDouble (p. 2679)

6.556.3.6 double decaf::util::Random::nextGaussian ()

Pseudo-randomly generates (approximately) a normally distributed `double` value with mean 0.0 and a standard deviation value of `1.0` using the *polar method* of G. E. P. Box, M. E. Muller, and G. Marsaglia, as described by Donald E. Knuth in *The Art of Computer Programming, Volume 2: Seminumerical Algorithms*, section 3.4.1, subsection C, algorithm P

Returns:

double

See also:

nextDouble (p. 2679)

6.556.3.7 int decaf::util::Random::nextInt (int *n*) throw (lang::exceptions::IllegalArgumentException)

Returns to the caller a new pseudo-random integer value which is uniformly distributed between 0 (inclusively) and the value of `n` (exclusively).

Returns:

int

Parameters:

n int

Exceptions:

IllegalArgumentException

6.556.3.8 int decaf::util::Random::nextInt ()

Generates a uniformly distributed 32-bit `int` value from the this random number sequence.

Returns:

int uniformly distributed `int` value

See also:

next (p. 2678)
nextLong (p. 2680)

6.556.3.9 long long decaf::util::Random::nextLong ()

Generates a uniformly distributed 64-bit `int` value from the this random number sequence.

Returns:

64-bit `int` random number

See also:

next (p. 2678)
nextInt() (p. 2680)
nextInt(int) (p. 2680)

6.556.3.10 void decaf::util::Random::setSeed (unsigned long long *seed*)

Modifies the seed using linear congruential formula presented in *The Art of Computer Programming, Volume 2*, Section 3.2.1.

Parameters:

seed the seed that alters the state of the random number generator

See also:

next (p. 2678)
Random() (p. 2678)
Random(long)

6.557.3 Member Function Documentation

6.557.3.1 virtual void activemq::transport::inactivity::ReadChecker::run () [virtual]

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 2816).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/inactivity/**ReadChecker.h**

6.558 decaf::io::Reader Class Reference

`#include <src/main/decaf/io/Reader.h>`

Public Member Functions

- virtual ~**Reader** ()
- virtual void **setInputStream** (**InputStream** *is)=0

  Sets the target input stream.

- virtual **InputStream** * **getInputStream** ()=0

  Gets the target input stream.

- virtual std::size_t **read** (unsigned char *buffer, std::size_t count)=0 throw (IOException, lang::exceptions::NullPointerException)

  Attempts to read an array of bytes from the stream.

- virtual unsigned char **readByte** ()=0 throw (IOException)

  Attempts to read a byte from the input stream.

6.558.1 Constructor & Destructor Documentation

6.558.1.1 virtual decaf::io::Reader::~Reader () [inline, virtual]

6.558.2 Member Function Documentation

6.558.2.1 virtual InputStream* decaf::io::Reader::getInputStream () [pure virtual]

Gets the target input stream.

6.558.2.2 virtual std::size_t decaf::io::Reader::read (unsigned char * *buffer*, std::size_t *count*) throw (IOException, lang::exceptions::NullPointerException) [pure virtual]

Attempts to read an array of bytes from the stream.

Parameters:

buffer The target byte buffer.

count The number of bytes to read.

Returns:

The number of bytes read.

Exceptions:

IOException *(* p. ***1820)*** thrown if an error occurs.

6.558.2.3 virtual unsigned char decaf::io::Reader::readByte () throw (IOException) [pure virtual]

Attempts to read a byte from the input stream.

Returns:

The byte.

Exceptions:

IOException *(*p. *1820)* thrown if an error occurs.

6.558.2.4 virtual void decaf::io::Reader::setInputStream (InputStream * *is*) [pure virtual]

Sets the target input stream.

  Clones this exception.
- virtual ~**ReadOnlyBufferException** () throw ()

6.559.1 Constructor & Destructor Documentation

6.559.1.1 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException () throw () [inline]

Default Constructor.

6.559.1.2 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const lang::Exception & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex the exception to copy

6.559.1.3 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const ReadOnlyBufferException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex the exception to copy, which is an instance of this type

6.559.1.4 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.559.1.5 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.559.1.6 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.559.1.7 virtual decaf::nio::ReadOnlyBufferException::~ReadOnlyBufferException () throw () [inline, virtual]

6.559.2 Member Function Documentation

6.559.2.1 virtual ReadOnlyBufferException* decaf::nio::ReadOnlyBufferException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Reimplemented from **decaf::lang::exceptions::UnsupportedOperationException** (p. 3307).

The documentation for this class was generated from the following file:

6.560 decaf::util::concurrent::locks::ReadWriteLock Class Reference

A **ReadWriteLock** (p. 2688) maintains a pair of associated locks, one for read-only operations and one for writing.

`#include <src/main/decaf/util/concurrent/locks/ReadWriteLock.h>`

Public Member Functions

- virtual ~**ReadWriteLock** ()
- virtual **Lock** & **readLock** ()=0

  Returns the lock used for reading.

- virtual **Lock** & **writeLock** ()=0

  Returns the lock used for writing.

6.560.1 Detailed Description

A **ReadWriteLock** (p. 2688) maintains a pair of associated locks, one for read-only operations and one for writing. The read lock may be held simultaneously by multiple reader threads, so long as there are no writers. The write lock is exclusive.

All **ReadWriteLock** (p. 2688) implementations must guarantee that the memory synchronization effects of writeLock operations (as specified in the **Lock** (p. 2017) interface) also hold with respect to the associated readLock. That is, a thread successfully acquiring the read lock will see all updates made upon previous release of the write lock.

A read-write lock allows for a greater level of concurrency in accessing shared data than that permitted by a mutual exclusion lock. It exploits the fact that while only a single thread at a time (a writer thread) can modify the shared data, in many cases any number of threads can concurrently read the data (hence reader threads). In theory, the increase in concurrency permitted by the use of a read-write lock will lead to performance improvements over the use of a mutual exclusion lock. In practice this increase in concurrency will only be fully realized on a multi-processor, and then only if the access patterns for the shared data are suitable.

Whether or not a read-write lock will improve performance over the use of a mutual exclusion lock depends on the frequency that the data is read compared to being modified, the duration of the read and write operations, and the contention for the data - that is, the number of threads that will try to read or write the data at the same time. For example, a collection that is initially populated with data and thereafter infrequently modified, while being frequently searched (such as a directory of some kind) is an ideal candidate for the use of a read-write lock. However, if updates become frequent then the data spends most of its time being exclusively locked and there is little, if any increase in concurrency. Further, if the read operations are too short the overhead of the read-write lock implementation (which is inherently more complex than a mutual exclusion lock) can dominate the execution cost, particularly as many read-write lock implementations still serialize all threads through a small section of code. Ultimately, only profiling and measurement will establish whether the use of a read-write lock is suitable for your application.

Although the basic operation of a read-write lock is straight-forward, there are many policy decisions that an implementation must make, which may affect the effectiveness of the read-write lock in a given application. Examples of these policies include:

∗ Determining whether to grant the read lock or the write lock, when both readers and writers are waiting, at the time that a writer releases the write lock. Writer preference is common, as writes are expected to be short and infrequent. Reader preference is less common as it can lead to lengthy delays for a write if the readers are frequent and long-lived as expected. Fair, or "in-order" implementations are also possible. ∗ Determining whether readers that request the read lock while a reader is active and a writer is waiting, are granted the read lock. Preference to the reader can delay the writer indefinitely, while preference to the writer can reduce the potential for concurrency. ∗ Determining whether the locks are reentrant: can a thread with the write lock reacquire it? Can it acquire a read lock while holding the write lock? Is the read lock itself reentrant? ∗ Can the write lock be downgraded to a read lock without allowing an intervening writer? Can a read lock be upgraded to a write lock, in preference to other waiting readers or writers?

You should consider all of these things when evaluating the suitability of a given implementation for your application.

6.562 decaf::util::concurrent::locks::ReentrantLock Class Reference

A reentrant mutual exclusion **Lock** (p. 2017) with extended capabilities.

`#include <src/main/decaf/util/concurrent/locks/ReentrantLock.h>`Inheritance diagram for decaf::util::concurrent::locks::ReentrantLock:

Public Member Functions

- **ReentrantLock** ()
- virtual ~**ReentrantLock** ()
- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)

  Acquires the lock.

- virtual void **lockInterruptibly** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::InterruptedException)

  Acquires the lock unless the current thread is interrupted.

- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)

  Acquires the lock only if it is not held by another thread at the time of invocation.

- virtual bool **tryLock** (long long time, const **TimeUnit** &unit) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::InterruptedException)

  Acquires the lock if it is not held by another thread within the given waiting time and the current thread has not been interrupted.

- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Attempts to release this lock.

- virtual **Condition** * **newCondition** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::UnsupportedOperationException)

  *Returns a **Condition** (p. 1118) instance for use with this **Lock** (p. 2017) instance.*

- int **getHoldCount** () const

  Queries the number of holds on this lock by the current thread.

- bool **isHeldByCurrentThread** () const

  Queries if this lock is held by the current thread.

- bool **isLocked** () const

  Queries if this lock is held by any thread.

- bool **isFair** () const

  Returns true if this lock has fairness set true.

- std::string **toString** () const

  Returns a string identifying this lock, as well as its lock state.

6.562.1 Detailed Description

A reentrant mutual exclusion **Lock** (p. 2017) with extended capabilities. A **ReentrantLock** (p. 2692) is owned by the thread last successfully locking, but not yet unlocking it. A thread invoking lock will return, successfully acquiring the lock, when the lock is not owned by another thread. The method will return immediately if the current thread already owns the lock. This can be checked using methods **isHeldByCurrentThread()** (p. 2694), and **getHoldCount()** (p. 2693).

The constructor for this class accepts an optional fairness parameter. When set true, under contention, locks favor granting access to the longest-waiting thread. Otherwise this lock does not guarantee any particular access order. Programs using fair locks accessed by many threads may display lower overall throughput (i.e., are slower; often much slower) than those using the default setting, but have smaller variances in times to obtain locks and guarantee lack of starvation. Note however, that fairness of locks does not guarantee fairness of thread scheduling. Thus, one of many threads using a fair lock may obtain it multiple times in succession while other active threads are not progressing and not currently holding the lock. Also note that the untimed tryLock method does not honor the fairness setting. It will succeed if the lock is available even if other threads are waiting.

It is recommended practice to always immediately follow a call to lock with a try block, most typically in a before/after construction such as:

class X { private:

ReentrantLock (p. 2692) lock; // ...

public:

void m() { lock.lock(); // block until condition holds

try { // ... method body } finally { lock.unlock() } } }

In addition to implementing the **Lock** (p. 2017) interface, this class defines methods isLocked and getLockQueueLength, as well as some associated protected access methods that may be useful for instrumentation and monitoring.

Since:

1.0

6.562.2 Constructor & Destructor Documentation

6.562.2.1 decaf::util::concurrent::locks::ReentrantLock::ReentrantLock ()

6.562.2.2 virtual decaf::util::concurrent::locks::ReentrantLock::~ReentrantLock () [virtual]

6.562.3 Member Function Documentation

6.562.3.1 int decaf::util::concurrent::locks::ReentrantLock::getHoldCount () const

Queries the number of holds on this lock by the current thread. A thread has a hold on a lock for each lock action that is not matched by an unlock action.

The hold count information is typically only used for testing and debugging purposes. For example, if a certain section of code should not be entered with the lock already held then we can assert that fact:

class X { private:

ReentrantLock (p. 2692) lock; // ...

public:

void m() { assert(lock.getHoldCount() == 0); lock.lock(); try { // ... method body } catch(...) { lock.unlock(); } } }

Returns:

the number of holds on this lock by the current thread, or zero if this lock is not held by the current thread

6.562.3.2 bool decaf::util::concurrent::locks::ReentrantLock::isFair () const

Returns true if this lock has fairness set true.

Returns:

true if this lock has fairness set true

6.562.3.3 bool decaf::util::concurrent::locks::ReentrantLock::isHeldByCurrentThread () const

Queries if this lock is held by the current thread. This method is typically used for debugging and testing. For example, a method that should only be called while a lock is held can assert that this is the case:

class X { private: **ReentrantLock** (p. 2692) lock = new **ReentrantLock()** (p. 2693); // ...

public: void m() { assert(lock.isHeldByCurrentThread()); // ... method body } }

It can also be used to ensure that a reentrant lock is used in a non-reentrant manner, for example:

class X { private: **ReentrantLock** (p. 2692) lock = new **ReentrantLock()** (p. 2693); // ...

public: void m() { assert !lock.**isHeldByCurrentThread()** (p. 2694); lock.lock(); try { // ... method body } finally { lock.unlock(); } } }

Returns:

true if current thread holds this lock and false otherwise

6.562.3.4 bool decaf::util::concurrent::locks::ReentrantLock::isLocked () const

Queries if this lock is held by any thread. This method is designed for use in monitoring of the system state, not for synchronization control.

Returns:

true if any thread holds this lock and false otherwise

6.562.3.5 virtual void decaf::util::concurrent::locks::ReentrantLock::lock () throw (decaf::lang::exceptions::RuntimeException) [virtual]

Acquires the lock. Acquires the lock if it is not held by another thread and returns immediately, setting the lock hold count to one.

If the current thread already holds the lock then the hold count is incremented by one and the method returns immediately.

If the lock is held by another thread then the current thread becomes disabled for thread scheduling purposes and lies dormant until the lock has been acquired, at which time the lock hold count is set to one.

Exceptions:

RuntimeException if an error occurs while acquiring the lock.

Implements **decaf::util::concurrent::locks::Lock** (p. 2018).

6.562.3.6 virtual void decaf::util::concurrent::locks::ReentrantLock::lockInterruptibly () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::InterruptedException) [virtual]

Acquires the lock unless the current thread is interrupted. Acquires the lock if it is not held by another thread and returns immediately, setting the lock hold count to one.

If the current thread already holds this lock then the hold count is incremented by one and the method returns immediately.

If the lock is held by another thread then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

∗ The lock is acquired by the current thread; or ∗ Some other thread interrupts the current thread.

If the lock is acquired by the current thread then the lock hold count is set to one.

If the current thread:

∗ has its interrupted status set on entry to this method; or ∗ is interrupted while acquiring the lock,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

In this implementation, as this method is an explicit interruption point, preference is given to responding to the interrupt over normal or reentrant acquisition of the lock.

Exceptions:

RuntimeException if an error occurs while acquiring the lock.

InterruptedException if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported).

Implements **decaf::util::concurrent::locks::Lock** (p. 2019).

6.562.3.7 virtual Condition* decaf::util::concurrent::locks::ReentrantLock::newCondition () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Returns a **Condition** (p. 1118) instance for use with this **Lock** (p. 2017) instance. The returned **Condition** (p. 1118) instance supports the same usages as do the **Mutex** (p. 2385) Class' methods (wait, notify, and notifyAll).

* If this lock is not held when any of the **Condition** (p. 1118) waiting or signalling methods are called, then an IllegalMonitorStateException is thrown. * When the condition waiting methods are called the lock is released and, before they return, the lock is reacquired and the lock hold count restored to what it was when the method was called. * If a thread is interrupted while waiting then the wait will terminate, an InterruptedException will be thrown, and the thread's interrupted status will be cleared. * Waiting threads are signaled in FIFO order. * The ordering of lock reacquisition for threads returning from waiting methods is the same as for threads initially acquiring the lock, which is in the default case not specified, but for fair locks favors those threads that have been waiting the longest.

Exceptions:

RuntimeException if an error occurs while creating the **Condition** (p. 1118).

UnsupportedOperationException if this **Lock** (p. 2017) implementation does not support conditions

Implements **decaf::util::concurrent::locks::Lock** (p. 2019).

6.562.3.8 std::string decaf::util::concurrent::locks::ReentrantLock::toString () const

Returns a string identifying this lock, as well as its lock state. The state, in brackets, includes either the String "Unlocked" or the String "Locked by" followed by the name of the owning thread.

Returns:

a string identifying this lock, as well as its lock state

6.562.3.9 virtual bool decaf::util::concurrent::locks::ReentrantLock::tryLock (long long *time*, const TimeUnit & *unit*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::InterruptedException) [virtual]

Acquires the lock if it is not held by another thread within the given waiting time and the current thread has not been interrupted. Acquires the lock if it is not held by another thread and returns immediately with the value true, setting the lock hold count to one. If this lock has been set to use a fair ordering policy then an available lock will not be acquired if any other threads are waiting for the lock. This is in contrast to the **tryLock()** (p. 2697) method. If you want a timed tryLock that does permit barging on a fair lock then combine the timed and un-timed forms together:

if (lock.tryLock() || lock.tryLock(timeout, unit)) { ... }

If the current thread already holds this lock then the hold count is incremented by one and the method returns true.

If the lock is held by another thread then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

∗ The lock is acquired by the current thread; or ∗ Some other thread interrupts the current thread; or ∗ The specified waiting time elapses

If the lock is acquired then the value true is returned and the lock hold count is set to one.

If the current thread:

∗ has its interrupted status set on entry to this method; or ∗ is interrupted while acquiring the lock,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

In this implementation, as this method is an explicit interruption point, preference is given to responding to the interrupt over normal or reentrant acquisition of the lock, and over reporting the elapse of the waiting time.

Parameters:

time the maximum time to wait for the lock

unit the time unit of the time argument

Returns:

true if the lock was acquired and false if the waiting time elapsed before the lock was acquired

Exceptions:

RuntimeException if an error occurs while acquiring the lock.

InterruptedException if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported)

Implements **decaf::util::concurrent::locks::Lock** (p. 2020).

6.562.3.10 virtual bool decaf::util::concurrent::locks::ReentrantLock::tryLock () throw (decaf::lang::exceptions::RuntimeException) [virtual]

Acquires the lock only if it is not held by another thread at the time of invocation. Acquires the lock if it is not held by another thread and returns immediately with the value true, setting the lock hold count to one. Even when this lock has been set to use a fair ordering policy, a call to **tryLock()** (p. 2697) will immediately acquire the lock if it is available, whether or not other threads are currently waiting for the lock. This "barging" behavior can be useful in certain circumstances, even though it breaks fairness. If you want to honor the fairness setting for this lock, then use tryLock(0, **TimeUnit.SECONDS** (p. 3214)) which is almost equivalent (it also detects interruption).

If the current thread already holds this lock then the hold count is incremented by one and the method returns true.

If the lock is held by another thread then this method will return immediately with the value false.

Returns:

true if the lock was acquired and false otherwise

Exceptions:

RuntimeException if an error occurs while acquiring the lock.

Implements **decaf::util::concurrent::locks::Lock** (p. 2021).

6.562.3.11 virtual void decaf::util::concurrent::locks::ReentrantLock::unlock () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [virtual]

Attempts to release this lock. If the current thread is the holder of this lock then the hold count is decremented. If the hold count is now zero then the lock is released. If the current thread is not the holder of this lock then IllegalMonitorStateException is thrown.

Exceptions:

RuntimeException if an error occurs while acquiring the lock.

Implements **decaf::util::concurrent::locks::Lock** (p. 2021).

6.563.1.1 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException () throw () [inline]

Default Constructor.

6.563.1.2 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.563.1.3 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const RejectedExecutionException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex - The Exception to copy in this new instance.

References decaf::lang::Exception::Exception().

6.563.1.4 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.563.1.5 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file - The file name where exception occurs

lineNumber - The line number where the exception occurred.

msg - The message to report

... - list of primitives that are formatted into the message

6.563.1.6 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file - The file name where exception occurs

lineNumber - The line number where the exception occurred.

cause - The exception that was the cause for this one to be thrown.

msg - The message to report

... - list of primitives that are formatted into the message

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.565.2.2 virtual void activemq::commands::RemoveInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.565.2.3 virtual bool activemq::commands::RemoveInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.565.2.4 virtual unsigned char activemq::commands::RemoveInfo::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.565.2.5 virtual long long activemq::commands::RemoveInfo::getLastDeliveredSequenceId () const [virtual]

6.565.2.6 virtual Pointer<DataStructure>& activemq::commands::RemoveInfo::getObjectId () [virtual]

6.565.2.7 virtual const Pointer<DataStructure>& activemq::commands::RemoveInfo::getObjectId () const [virtual]

6.565.2.8 virtual bool activemq::commands::RemoveInfo::isRemoveInfo () const [inline, virtual]

Returns:

an answer of true to the **isRemoveInfo()** (p. 2705) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 654).

6.565.2.9 RemoveInfo& activemq::commands::RemoveInfo::operator= (const RemoveInfo &) [inline, protected]

6.565.2.10 virtual void activemq::commands::RemoveInfo::setLastDeliveredSequenceId (long long *lastDeliveredSequenceId*) [virtual]

6.565.2.11 virtual void activemq::commands::RemoveInfo::setObjectId (const Pointer< DataStructure > & *objectId*) [virtual]

6.565.2.12 virtual std::string activemq::commands::RemoveInfo::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 655).

6.565.2.13 virtual Pointer<Command> activemq::commands::RemoveInfo::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1067).

6.565.3 Field Documentation

6.565.3.1 const unsigned char activemq::commands::RemoveInfo::ID_REMOVEINFO = 12 [static]

6.565.3.2 long long activemq::commands::RemoveInfo::lastDeliveredSequenceId [protected]

6.565.3.3 Pointer<DataStructure> activemq::commands::RemoveInfo::objectId [protected]

The documentation for this class was generated from the following file:

Public Member Functions

- **RemoveInfoMarshaller** ()
- virtual ~**RemoveInfoMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.566.1 Detailed Description

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 2707). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.566.2 Constructor & Destructor Documentation

6.566.2.1 activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::RemoveInfoMarshall () [inline]

6.566.2.2 virtual activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::~RemoveInfoMarsha () [inline, virtual]

6.566.3 Member Function Documentation

6.566.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.566.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.566.3.3 virtual void activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 665).

6.566.3.4 virtual void activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 666).

6.566.3.5 virtual int activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 667).

6.566.3.6 virtual void activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 668).

6.566.3.7 virtual void activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 669).

6.567.2.2 virtual activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::~RemoveInfoMarsha () [inline, virtual]

6.567.3 Member Function Documentation

6.567.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.567.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.567.3.3 virtual void activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 679).

6.567.3.4 virtual void activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 680).

6.567.3.5 virtual int activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 681).

6.567.3.6 virtual void activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 682).

6.567.3.7 virtual void activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 683).

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 688).

6.568.3.6 virtual void activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 689).

6.568.3.7 virtual void activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 690).

6.569.3 Member Function Documentation

6.569.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.569.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.569.3.3 virtual void activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 658).

6.569.3.4 virtual void activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 659).

6.569.3.5 virtual int activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 660).

6.569.3.6 virtual void activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 661).

6.569.3.7 virtual void activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 662).

The documentation for this class was generated from the following file:

  Write a object instance to data output stream.

6.570.1 Detailed Description

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 2723). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.570.2 Constructor & Destructor Documentation

6.570.2.1 activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::RemoveInfoMarshall () [inline]

6.570.2.2 virtual activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::~RemoveInfoMarsha () [inline, virtual]

6.570.3 Member Function Documentation

6.570.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.570.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.570.3.3 virtual void activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 672).

6.570.3.4 virtual void activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 673).

6.570.3.5 virtual int activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 674).

6.570.3.6 virtual void activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 675).

6.570.3.7 virtual void activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 676).

6.571.1 Constructor & Destructor Documentation

6.571.1.1 activemq::commands::RemoveSubscriptionInfo::RemoveSubscriptionInfo (const RemoveSubscriptionInfo &) [inline, protected]

6.571.1.2 activemq::commands::RemoveSubscriptionInfo::RemoveSubscriptionInfo ()

6.571.1.3 virtual activemq::commands::RemoveSubscriptionInfo::~RemoveSubscriptionInfo () [virtual]

6.571.2 Member Function Documentation

6.571.2.1 virtual RemoveSubscriptionInfo* activemq::commands::RemoveSubscriptionInfo::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.571.2.2 virtual void activemq::commands::RemoveSubscriptionInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.571.2.3 virtual bool activemq::commands::RemoveSubscriptionInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.571.2.4 virtual std::string& activemq::commands::RemoveSubscriptionInfo::getClientId () [virtual]

6.571.2.5 virtual const std::string& activemq::commands::RemoveSubscriptionInfo::getClientId () const [virtual]

6.571.2.6 virtual Pointer<ConnectionId>& activemq::commands::RemoveSubscriptionInfo::getConnectionId () [virtual]

6.571.2.7 virtual const Pointer<ConnectionId>& activemq::commands::RemoveSubscriptionInfo::getConnectionId () const [virtual]

6.571.2.8 virtual unsigned char activemq::commands::RemoveSubscriptionInfo::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.571.2.9 virtual std::string& activemq::commands::RemoveSubscriptionInfo::getSubcriptionName () [virtual]

6.571.2.10 virtual const std::string& activemq::commands::RemoveSubscriptionInfo::getSubcriptionName () const [virtual]

6.571.2.11 virtual bool activemq::commands::RemoveSubscriptionInfo::isRemoveSubscriptionInfo () const [inline, virtual]

Returns:

an answer of true to the **isRemoveSubscriptionInfo()** (p. 2730) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 654).

6.571.2.12 RemoveSubscriptionInfo& activemq::commands::RemoveSubscriptionInfo::operator= (const RemoveSubscriptionInfo &) [inline, protected]

6.571.2.13 virtual void activemq::commands::RemoveSubscriptionInfo::setClientId (const std::string & *clientId*) [virtual]

6.571.2.14 virtual void activemq::commands::RemoveSubscriptionInfo::setConnectionId (const Pointer< ConnectionId > & *connectionId*) [virtual]

6.571.2.15 virtual void activemq::commands::RemoveSubscriptionInfo::setSubcriptionName (const std::string & *subcriptionName*) [virtual]

6.571.2.16 virtual std::string activemq::commands::RemoveSubscriptionInfo::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 655).

6.571.2.17 virtual Pointer<Command> activemq::commands::RemoveSubscriptionInfo::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1067).

6.571.3 Field Documentation

6.572.3 Member Function Documentation

6.572.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller::createObj () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.572.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller::getDataSt () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.572.3.3 virtual void activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller::looseMars (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 679).

6.572.3.4 virtual void activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller::looseUnm (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 680).

6.572.3.5 virtual int activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller::tightMars (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 681).

6.572.3.6 virtual void activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller::tightMars (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 682).

6.572.3.7 virtual void activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller::tightUnma (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 683).

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.574.1 Detailed Description

Marshaling code for Open Wire Format for **RemoveSubscriptionInfoMarshaller** (p. 2740). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.574.2 Constructor & Destructor Documentation

6.574.2.1 activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::Remove

() [inline]

6.574.2.2 virtual activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::~Remov

() [inline, virtual]

6.574.3 Member Function Documentation

6.574.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::createObj

() const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.574.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::getDataSt

() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.574.3.3 virtual void activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::looseMars

(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 665).

6.574.3.4 virtual void activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::looseUnm (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 666).

6.574.3.5 virtual int activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::tightMars (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 667).

6.574.3.6 virtual void activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::tightMars (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 668).

6.574.3.7 virtual void activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::tightUnma (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 669).

6.575.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::createObj () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.575.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::getDataSt () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.575.3.3 virtual void activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::looseMars (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 658).

6.575.3.4 virtual void activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::looseUnm (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 659).

6.575.3.5 virtual int activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::tightMars (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 660).

6.575.3.6 virtual void activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::tightMars (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 661).

6.575.3.7 virtual void activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::tightUnma (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 662).

6.576.3 Member Function Documentation

6.576.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::createObj

() const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.576.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::getDataSt

() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.576.3.3 virtual void activemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::looseMars

(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 672).

6.576.3.4 virtual void activemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::looseUnm (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 673).

6.576.3.5 virtual int activemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::tightMars (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 674).

6.576.3.6 virtual void activemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::tightMars (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 675).

6.576.3.7 virtual void activemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::tightUnma (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 676).

6.577.1 Constructor & Destructor Documentation

6.577.1.1 activemq::commands::ReplayCommand::ReplayCommand (const ReplayCommand &) [inline, protected]

6.577.1.2 activemq::commands::ReplayCommand::ReplayCommand ()

6.577.1.3 virtual activemq::commands::ReplayCommand::~ReplayCommand () [virtual]

6.577.2 Member Function Documentation

6.577.2.1 virtual ReplayCommand* activemq::commands::ReplayCommand::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.577.2.2 virtual void activemq::commands::ReplayCommand::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.577.2.3 virtual bool activemq::commands::ReplayCommand::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.577.2.4 virtual unsigned char activemq::commands::ReplayCommand::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.577.2.5 virtual int activemq::commands::ReplayCommand::getFirstNakNumber () const [virtual]

6.577.2.6 virtual int activemq::commands::ReplayCommand::getLastNakNumber () const [virtual]

6.577.2.7 ReplayCommand& activemq::commands::ReplayCommand::operator= (const ReplayCommand &) [inline, protected]

6.577.2.8 virtual void activemq::commands::ReplayCommand::setFirstNakNumber (int *firstNakNumber*) [virtual]

6.577.2.9 virtual void activemq::commands::ReplayCommand::setLastNakNumber (int *lastNakNumber*) [virtual]

6.577.2.10 virtual std::string activemq::commands::ReplayCommand::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 655).

6.577.2.11 virtual Pointer<Command> activemq::commands::ReplayCommand::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1067).

6.577.3 Field Documentation

6.578.1 Detailed Description

Marshaling code for Open Wire Format for **ReplayCommandMarshaller** (p. 2756). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.578.2 Constructor & Destructor Documentation

6.578.2.1 activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::ReplayComma () [inline]

6.578.2.2 virtual activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::~ReplayComm () [inline, virtual]

6.578.3 Member Function Documentation

6.578.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.578.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::getDataStructure () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.578.3.3 virtual void activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 686).

6.578.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 687).

6.578.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 688).

6.578.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 689).

6.578.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 690).

The documentation for this class was generated from the following file:

Marshaling code for Open Wire Format for **ReplayCommandMarshaller** (p. 2760). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.579.2 Constructor & Destructor Documentation

6.579.2.1 activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::ReplayComma () [inline]

6.579.2.2 virtual activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::~ReplayComm () [inline, virtual]

6.579.3 Member Function Documentation

6.579.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.579.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::getDataStructure () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.579.3.3 virtual void activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 658).

6.579.3.4 virtual void activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 659).

6.579.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 660).

6.579.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 661).

6.579.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 662).

6.580.1 Detailed Description

Marshaling code for Open Wire Format for **ReplayCommandMarshaller** (p. 2764). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.580.2 Constructor & Destructor Documentation

6.580.2.1 activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::ReplayComma () [inline]

6.580.2.2 virtual activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::~ReplayComm () [inline, virtual]

6.580.3 Member Function Documentation

6.580.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.580.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::getDataStructure () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.580.3.3 virtual void activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 679).

6.580.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 680).

6.580.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 681).

6.580.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 682).

6.580.3.7 virtual void activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 683).

6.582.3 Member Function Documentation

6.582.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.582.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::getDataStructure () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.582.3.3 virtual void activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 665).

6.582.3.4 virtual void activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 666).

6.582.3.5 virtual int activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 667).

6.582.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 668).

6.582.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 669).

6.585 activemq::cmsutil::ResourceLifecycleManager Class Reference

Manages the lifecycle of a set of CMS resources.

`#include <src/main/activemq/cmsutil/ResourceLifecycleManager.h>`

Public Member Functions

- **ResourceLifecycleManager** ()
- virtual ~**ResourceLifecycleManager** ()

  Destructor - calls `destroy`.

- void **addConnection** (**cms::Connection** *connection)

  Adds a connection so that its life will be managed by this object.

- void **addSession** (**cms::Session** *session)

  Adds a session so that its life will be managed by this object.

- void **addDestination** (**cms::Destination** *dest)

  Adds a destination so that its life will be managed by this object.

- void **addMessageProducer** (**cms::MessageProducer** *producer)

  Adds a message producer so that its life will be managed by this object.

- void **addMessageConsumer** (**cms::MessageConsumer** *consumer)

  Adds a message consumer so that its life will be managed by this object.

- void **destroy** () throw (cms::CMSException)

  Closes and destroys the contained CMS resources.

- void **releaseAll** ()

  Releases all of the contained resources so that this object will no longer control their lifetimes.

6.585.1 Detailed Description

Manages the lifecycle of a set of CMS resources. A call to `destroy` will close and destroy all of the contained resources in the appropriate manner.

6.585.2 Constructor & Destructor Documentation

6.585.2.1 activemq::cmsutil::ResourceLifecycleManager::ResourceLifecycleManager ()

6.585.2.2 virtual activemq::cmsutil::ResourceLifecycleManager::~ResourceLifecycleManager () `[virtual]`

Destructor - calls `destroy`.

6.585.3 Member Function Documentation

6.585.3.1 void activemq::cmsutil::ResourceLifecycleManager::addConnection (cms::Connection * *connection*) [inline]

Adds a connection so that its life will be managed by this object.

Parameters:

connection the object to be managed

6.585.3.2 void activemq::cmsutil::ResourceLifecycleManager::addDestination (cms::Destination * *dest*) [inline]

Adds a destination so that its life will be managed by this object.

Parameters:

dest the object to be managed

6.585.3.3 void activemq::cmsutil::ResourceLifecycleManager::addMessageConsumer (cms::MessageConsumer * *consumer*) [inline]

Adds a message consumer so that its life will be managed by this object.

Parameters:

consumer the object to be managed

6.585.3.4 void activemq::cmsutil::ResourceLifecycleManager::addMessageProducer (cms::MessageProducer * *producer*) [inline]

Adds a message producer so that its life will be managed by this object.

Parameters:

producer the object to be managed

6.585.3.5 void activemq::cmsutil::ResourceLifecycleManager::addSession (cms::Session * *session*) [inline]

Adds a session so that its life will be managed by this object.

Parameters:

session the object to be managed

6.585.3.6 void activemq::cmsutil::ResourceLifecycleManager::destroy () throw (cms::CMSException)

Closes and destroys the contained CMS resources.

Exceptions:

cms::CMSException (p. ***1031***) thrown if an error occurs.

6.585.3.7 void activemq::cmsutil::ResourceLifecycleManager::releaseAll ()

Releases all of the contained resources so that this object will no longer control their lifetimes.

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**ResourceLifecycleManager.h**

6.586 activemq::commands::Response Class Reference

`#include <src/main/activemq/commands/Response.h>`Inheritance diagram for activemq::commands::Response:

Public Member Functions

- **Response** ()
- virtual ~**Response** ()
- virtual unsigned char **getDataStructureType** () const

  Get the unique identifier that this object and its own Marshaler share.

- virtual **Response** * **cloneDataStructure** () const

  Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

  Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure*** (p. *1461) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure*** (p. *1461) passed in to this one, and returns if they are equivalent.*

- virtual int **getCorrelationId** () const
- virtual void **setCorrelationId** (int **correlationId**)
- virtual bool **isResponse** () const
- virtual **Pointer**< **Command** > **visit** (**activemq::state::CommandVisitor** *visitor) throw (exceptions::ActiveMQException)

  Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

6.586.1 Constructor & Destructor Documentation

6.586.1.1 activemq::commands::Response::Response (const Response &) [inline, protected]

6.586.1.2 activemq::commands::Response::Response ()

6.586.1.3 virtual activemq::commands::Response::~Response () [virtual]

6.586.2 Member Function Documentation

6.586.2.1 virtual Response* activemq::commands::Response::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1357), **activemq::commands::DataResponse** (p. 1396), **activemq::commands::ExceptionResponse** (p. 1583), and **activemq::commands::IntegerResponse** (p. 1778).

6.586.2.2 virtual void activemq::commands::Response::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1357), **activemq::commands::DataResponse** (p. 1396), **activemq::commands::ExceptionResponse** (p. 1583), and **activemq::commands::IntegerResponse** (p. 1778).

6.586.2.3 virtual bool activemq::commands::Response::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1357), **activemq::commands::DataResponse** (p. 1396), **activemq::commands::ExceptionResponse** (p. 1583), and **activemq::commands::IntegerResponse** (p. 1778).

6.586.2.4 virtual int activemq::commands::Response::getCorrelationId () const [virtual]

6.586.2.5 virtual unsigned char activemq::commands::Response::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1358), **activemq::commands::DataResponse** (p. 1397), **activemq::commands::ExceptionResponse** (p. 1583), and **activemq::commands::IntegerResponse** (p. 1778).

6.586.2.6 virtual bool activemq::commands::Response::isResponse () const [inline, virtual]

Returns:

an answer of true to the **isResponse()** (p. 2783) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 654).

6.586.2.7 Response& activemq::commands::Response::operator= (const Response &) [inline, protected]

6.586.2.8 virtual void activemq::commands::Response::setCorrelationId (int *correlationId*) [virtual]

6.586.2.9 virtual std::string activemq::commands::Response::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 655).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1358), **activemq::commands::DataResponse** (p. 1397), **activemq::commands::ExceptionResponse** (p. 1584), and **activemq::commands::IntegerResponse** (p. 1779).

6.586.2.10 virtual Pointer<Command> activemq::commands::Response::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1067).

6.586.3 Field Documentation

6.586.3.1 int activemq::commands::Response::correlationId [protected]

6.586.3.2 const unsigned char activemq::commands::Response::ID_RESPONSE = 30 [static]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**Response.h**

6.587 activemq::transport::mock::ResponseBuilder Class Reference

Interface for all Protocols to implement that defines the behavior of the Broker in response to messages of that protocol.

`#include <src/main/activemq/transport/mock/ResponseBuilder.h>`Inheritance diagram for activemq::transport::mock::ResponseBuilder:

Public Member Functions

- virtual ~**ResponseBuilder** ()
- virtual **Pointer**< **Response** > **buildResponse** (const **Pointer**< **Command** > &command)=0

  Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.

- virtual void **buildIncomingCommands** (const **Pointer**< **Command** > &command, **decaf::util::StlQueue**< **Pointer**< **Command** > > &queue)=0

  *When called the **ResponseBuilder** (p. 2785) must construct all the Responses or Asynchronous commands that would be sent to this client by the Broker upon receipt of the passed command.*

6.587.1 Detailed Description

Interface for all Protocols to implement that defines the behavior of the Broker in response to messages of that protocol.

6.587.2 Constructor & Destructor Documentation

6.587.2.1 virtual activemq::transport::mock::ResponseBuilder::~ResponseBuilder () [inline, virtual]

6.587.3 Member Function Documentation

6.587.3.1 virtual void activemq::transport::mock::ResponseBuilder::buildIncomingCommands (const Pointer< Command > & *command*, decaf::util::StlQueue< Pointer< Command > > & *queue*) [pure virtual]

When called the **ResponseBuilder** (p. 2785) must construct all the Responses or Asynchronous commands that would be sent to this client by the Broker upon receipt of the passed command.

Parameters:

command - The Command being sent to the Broker.

queue - Queue of Command sent back from the broker.

Implemented in **activemq::wireformat::openwire::OpenWireResponseBuilder** (p. 2466).

6.587.3.2 virtual Pointer<Response> activemq::transport::mock::ResponseBuilder::buildResponse (const Pointer< Command > & *command*) [pure virtual]

Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.

Parameters:

command - The command to build a response for

Returns:

A Response object pointer, or NULL if no response.

Implemented in **activemq::wireformat::openwire::OpenWireResponseBuilder** (p. 2467).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/mock/**ResponseBuilder.h**

6.588 activemq::transport::correlator::ResponseCorrelator Class Reference

This type of transport filter is responsible for correlating asynchronous responses with requests.

`#include <src/main/activemq/transport/correlator/ResponseCorrelator.h>`Inheritance diagram for activemq::transport::correlator::ResponseCorrelator:

Public Member Functions

- **ResponseCorrelator** (const **Pointer**< **Transport** > &**next**)

  Constructor.

- virtual ~**ResponseCorrelator** ()
- virtual void **oneway** (const **Pointer**< **Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

  Sends a one-way command.

- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

  Sends the given request to the server and waits for the response.

- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

  Sends the given request to the server and waits for the response.

- virtual void **onCommand** (const **Pointer**< **Command** > &command)

  This is called in the context of the nested transport's reading thread.

- virtual void **start** () throw (decaf::io::IOException)

  Starts this transport object and creates the thread for polling on the input stream for commands.

- virtual void **close** () throw (decaf::io::IOException)

  Stops the polling thread and closes the streams.

- virtual void **onTransportException** (**Transport** *source, const **decaf::lang::Exception** &ex)

  Event handler for an exception from a command transport.

6.588.1 Detailed Description

This type of transport filter is responsible for correlating asynchronous responses with requests. Non-response messages are simply sent directly to the CommandListener. It owns the transport that it

6.588.2 Constructor & Destructor Documentation

6.588.2.1 activemq::transport::correlator::ResponseCorrelator::ResponseCorrelator (const Pointer< Transport > & *next*)

Constructor.

Parameters:

next the next transport in the chain

6.588.2.2 virtual activemq::transport::correlator::ResponseCorrelator::~ResponseCorrelator () [virtual]

6.588.3 Member Function Documentation

6.588.3.1 virtual void activemq::transport::correlator::ResponseCorrelator::close () throw (decaf::io::IOException) [virtual]

Stops the polling thread and closes the streams. This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

Exceptions:

IOException if errors occur.

Reimplemented from **activemq::transport::TransportFilter** (p. 3283).

6.588.3.2 virtual void activemq::transport::correlator::ResponseCorrelator::onCommand (const Pointer< Command > & *command*) [virtual]

This is called in the context of the nested transport's reading thread. In the case of a response object, updates the request map and notifies those waiting on the response. Non-response messages are just delegated to the command listener.

Parameters:

command the received from the nested transport.

Reimplemented from **activemq::transport::TransportFilter** (p. 3285).

6.588.3.3 virtual void activemq::transport::correlator::ResponseCorrelator::oneway (const Pointer< Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command the command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Reimplemented from **activemq::transport::TransportFilter** (p. 3285).

6.588.3.4 virtual void activemq::transport::correlator::ResponseCorrelator::onTransportException (Transport * *source*, const decaf::lang::Exception & *ex*) [virtual]

Event handler for an exception from a command transport.

Parameters:

source The source of the exception

ex The exception.

6.588.3.5 virtual Pointer<Response> activemq::transport::correlator::ResponseCorrelator::request (const Pointer< Command > & *command*, unsigned int *timeout*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends the given request to the server and waits for the response.

Parameters:

command The request to send.

timeout The time to wait for a response.

Returns:

the response from the server.

Exceptions:

IOException if an error occurs with the request.

Reimplemented from **activemq::transport::TransportFilter** (p. 3286).

6.588.3.6 virtual Pointer<Response> activemq::transport::correlator::ResponseCorrelator::request (const Pointer< Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends the given request to the server and waits for the response.

Parameters:

command The request to send.

Returns:

the response from the server.

Exceptions:

IOException if an error occurs with the request.

Reimplemented from **activemq::transport::TransportFilter** (p. 3287).

6.588.3.7 virtual void activemq::transport::correlator::ResponseCorrelator::start () throw (decaf::io::IOException) [virtual]

Starts this transport object and creates the thread for polling on the input stream for commands. If this object has been closed, throws an exception. Before calling start, the caller must set the IO streams and the reader and writer objects.

Exceptions:

IOException if an error occurs or if this transport has already been closed.

Reimplemented from **activemq::transport::TransportFilter** (p. 3287).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/correlator/**ResponseCorrelator.h**

6.589 activemq::wireformat::openwire::marshal::v2::ResponseMarshaller Class Reference

Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 2791).

`#include <src/main/activemq/wireformat/openwire/marshal/v2/ResponseMarshaller.h>`Inheritance diagram for activemq::wireformat::openwire::marshal::v2::ResponseMarshaller:

Public Member Functions

- **ResponseMarshaller** ()
- virtual ~**ResponseMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.589.1 Detailed Description

Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 2791). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.589.2 Constructor & Destructor Documentation

6.589.2.1 activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::ResponseMarshaller () [inline]

6.589.2.2 virtual activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::~ResponseMarshaller () [inline, virtual]

6.589.3 Member Function Documentation

6.589.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller** (p. 1376), **activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller** (p. 1415), **activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller** (p. 1586), and **activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller** (p. 1781).

6.589.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller** (p. 1376), **activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller** (p. 1415), **activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller** (p. 1586), and **activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller** (p. 1781).

6.589.3.3 virtual void activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 686).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller** (p. 1376), **activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller** (p. 1415), **activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller** (p. 1586), and **activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller** (p. 1781).

6.589.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 687).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller** (p. 1377), **activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller** (p. 1416), **activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller** (p. 1587), and **activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller** (p. 1782).

6.589.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 688).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller** (p. 1377), **activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller** (p. 1416), **activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller** (p. 1587), and **activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller** (p. 1782).

6.589.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 689).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller** (p. 1378), **activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller** (p. 1417), **activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller** (p. 1588), and **activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller** (p. 1783).

6.589.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 690).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller** (p. 1378), **activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller** (p. 1417), **activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller** (p. 1588), and **activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller** (p. 1783).

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.590.1 Detailed Description

Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 2796). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.590.2 Constructor & Destructor Documentation

6.590.2.1 activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::ResponseMarshaller () [inline]

6.590.2.2 virtual activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::~ResponseMarshaller () [inline, virtual]

6.590.3 Member Function Documentation

6.590.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller** (p. 1360), **activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller** (p. 1399), **activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller** (p. 1594), and **activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller** (p. 1789).

6.590.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller** (p. 1360), **activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller** (p. 1399), **activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller** (p. 1594), and **activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller** (p. 1789).

6.590.3.3 virtual void activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 658).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller** (p. 1360), **activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller** (p. 1399), **activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller** (p. 1594), and **activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller** (p. 1789).

6.590.3.4 virtual void activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 659).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller** (p. 1361), **activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller** (p. 1400), **activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller** (p. 1595), and **activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller** (p. 1790).

6.590.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 660).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller** (p. 1361), **activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller** (p. 1400), **activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller** (p. 1595), and **activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller** (p. 1790).

6.590.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 661).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller** (p. 1362), **activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller** (p. 1401), **activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller** (p. 1596), and **activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller** (p. 1791).

6.590.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 662).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller** (p. 1362), **activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller** (p. 1401), **activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller** (p. 1596), and **activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller** (p. 1791).

6.592.3 Member Function Documentation

6.592.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller** (p. 1368), **activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller** (p. 1403), **activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller** (p. 1590), and **activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller** (p. 1785).

6.592.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller** (p. 1368), **activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller** (p. 1403), **activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller** (p. 1590), and **activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller** (p. 1785).

6.592.3.3 virtual void activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 665).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller** (p. 1368), **activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller** (p. 1403), **activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller** (p. 1590), and **activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller** (p. 1785).

6.592.3.4 virtual void activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 666).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller** (p. 1369), **activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller** (p. 1404), **activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller** (p. 1591), and **activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller** (p. 1786).

6.592.3.5 virtual int activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 667).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller** (p. 1369), **activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller** (p. 1404), **activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller** (p. 1591), and **activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller** (p. 1786).

6.592.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 668).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller** (p. 1370), **activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller** (p. 1405), **activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller** (p. 1592), and **activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller** (p. 1787).

6.592.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 669).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller** (p. 1370), **activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller** (p. 1405), **activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller** (p. 1592), and **activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller** (p. 1787).

6.593 activemq::wireformat::openwire::marshal::v4::ResponseMarshaller Class Reference

Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 2811).

`#include <src/main/activemq/wireformat/openwire/marshal/v4/ResponseMarshaller.h>`Inheritance diagram for activemq::wireformat::openwire::marshal::v4::ResponseMarshaller:

Public Member Functions

- **ResponseMarshaller** ()
- virtual ~**ResponseMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.593.1 Detailed Description

Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 2811). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.593.2 Constructor & Destructor Documentation

6.593.2.1 activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::ResponseMarshaller () [inline]

6.593.2.2 virtual activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::~ResponseMarshaller () [inline, virtual]

6.593.3 Member Function Documentation

6.593.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller** (p. 1364), **activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller** (p. 1411), **activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller** (p. 1598), and **activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller** (p. 1793).

6.593.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller** (p. 1364), **activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller** (p. 1411), **activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller** (p. 1598), and **activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller** (p. 1793).

6.593.3.3 virtual void activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 672).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller** (p. 1364), **activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller** (p. 1411), **activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller** (p. 1598), and **activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller** (p. 1793).

6.593.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 673).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller** (p. 1365), **activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller** (p. 1412), **activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller** (p. 1599), and **activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller** (p. 1794).

6.593.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 674).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller** (p. 1365), **activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller** (p. 1412), **activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller** (p. 1599), and **activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller** (p. 1794).

6.593.3.6 virtual void activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 675).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller** (p. 1366), **activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller** (p. 1413), **activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller** (p. 1600), and **activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller** (p. 1795).

6.593.3.7 virtual void activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 676).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller** (p. 1366), **activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller** (p. 1413), **activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller** (p. 1600), and **activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller** (p. 1795).

6.595 decaf::lang::Runtime Class Reference

`#include <src/main/decaf/lang/Runtime.h>`Inheritance diagram for decaf::lang::Runtime:

Public Member Functions

- virtual ~**Runtime** ()

Static Public Member Functions

- static **Runtime** * **getRuntime** ()

  *Gets the single instance of the Decaf **Runtime** (p. 2817) for this Process.*

- static void **initializeRuntime** (int argc, char **argv)

  Initialize the Decaf Library passing it the args that were passed to the application at startup.

- static void **initializeRuntime** ()

  Initialize the Decaf Library.

- static void **shutdownRuntime** ()

  Shutdown the Decaf Library, this call should take places after all objects that were created from the Decaf library have been deallocated.

6.595.1 Constructor & Destructor Documentation

6.595.1.1 virtual decaf::lang::Runtime::~Runtime () `[inline, virtual]`

6.595.2 Member Function Documentation

6.595.2.1 static Runtime* decaf::lang::Runtime::getRuntime () `[static]`

Gets the single instance of the Decaf **Runtime** (p. 2817) for this Process.

Returns:

pointer to the single Decaf **Runtime** (p. 2817) instance that exists for this process

6.595.2.2 static void decaf::lang::Runtime::initializeRuntime () `[static]`

Initialize the Decaf Library.

Exceptions:

runtime_error if the library is already initialized or an error occurs during initialization.

6.595.2.3 static void decaf::lang::Runtime::initializeRuntime (int *argc*, char ** *argv*) [static]

Initialize the Decaf Library passing it the args that were passed to the application at startup.

Parameters:

argc - The number of args passed

argv - Array of char* values passed to the Process on start.

Exceptions:

runtime_error if the library is already initialized or an error occurs during initialization.

6.595.2.4 static void decaf::lang::Runtime::shutdownRuntime () [static]

Shutdown the Decaf Library, this call should take places after all objects that were created from the Decaf library have been deallocated.

Exceptions:

runtime_error if the library has not already been initialized or an error occurs during shutdown.

The documentation for this class was generated from the following file:

6.596 decaf::lang::exceptions::RuntimeException Class Reference

`#include <src/main/decaf/lang/exceptions/RuntimeException.h>`Inheritance diagram for decaf::lang::exceptions::RuntimeException:

Public Member Functions

- **RuntimeException** () throw ()
  Default Constructor.
- **RuntimeException** (const **Exception** &ex) throw ()
  Conversion Constructor from some other ActiveMQException.
- **RuntimeException** (const **RuntimeException** &ex) throw ()
  Copy Constructor.
- **RuntimeException** (const char *file, const int lineNumber, const std::exception ***cause**, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- **RuntimeException** (const std::exception ***cause**) throw ()
  Constructor.
- **RuntimeException** (const char *file, const int lineNumber, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **RuntimeException** * **clone** () const
  Clones this exception.
- virtual ~**RuntimeException** () throw ()

6.596.1 Constructor & Destructor Documentation

6.596.1.1 decaf::lang::exceptions::RuntimeException::RuntimeException () throw () [inline]

Default Constructor.

6.596.1.2 decaf::lang::exceptions::RuntimeException::RuntimeException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other ActiveMQException.

Parameters:

ex The **Exception** (p. 1574) whose data is to be copied into this one.

6.596.1.3 decaf::lang::exceptions::RuntimeException::RuntimeException (const RuntimeException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex The **Exception** (p. 1574) whose data is to be copied into this one.

6.596.1.4 decaf::lang::exceptions::RuntimeException::RuntimeException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.596.1.5 decaf::lang::exceptions::RuntimeException::RuntimeException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause **Pointer** (p. 2497) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.596.1.6 decaf::lang::exceptions::RuntimeException::RuntimeException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.596.1.7 virtual decaf::lang::exceptions::RuntimeException::~RuntimeException () throw () [inline, virtual]

6.596.2 Member Function Documentation

6.596.2.1 virtual RuntimeException* decaf::lang::exceptions::RuntimeException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1574) that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1577).

The documentation for this class was generated from the following file:

6.598 decaf::security_provider::SecurityProviderMap Class Reference

Lookup Map for Connector Factories.

`#include <src/main/decaf/security_provider/SecurityProviderMap.h>`

Public Member Functions

- void **registerSecurityProvider** (const std::string &name, **SecurityProvider** *provider)

  Registers a new provider with this map.

- void **unregisterSecurityProvider** (const std::string &name)

  Unregisters a provider from this map.

- **SecurityProvider** * **lookup** (const std::string &name)

  Lookup the named provider in the Map.

- std::size_t **getSecurityProviderNames** (std::vector< std::string > &providers)

  Fetch a list of provider names that this Map contains.

Static Public Member Functions

- static **SecurityProviderMap** * **getInstance** ()

  Gets a singleton instance of this class.

6.598.1 Detailed Description

Lookup Map for Connector Factories. Use the Connector name to find the associated factory. This class does not take ownership of the stored factories, they must be deallocated somewhere.

6.598.2 Member Function Documentation

6.598.2.1 static SecurityProviderMap* decaf::security_provider::SecurityProviderMap::getInstance () [static]

Gets a singleton instance of this class.

Referenced by decaf::security_provider::SecurityProviderRegistrar::SecurityProviderRegistrar(), and decaf::security_provider::SecurityProviderRegistrar::~SecurityProviderRegistrar().

6.598.2.2 std::size_t decaf::security_provider::SecurityProviderMap::getSecurityProviderNames (std::vector< std::string > & *providers*)

Fetch a list of provider names that this Map contains.

Parameters:

providers A vector object to receive the list

Returns:

count of providers.

6.598.2.3 SecurityProvider* decaf::security_provider::SecurityProviderMap::lookup (const std::string & *name*)

Lookup the named provider in the Map.

Parameters:

name the provider name to lookup

Returns:

the provider assciated with the name, or NULL

6.598.2.4 void decaf::security_provider::SecurityProviderMap::registerSecurityProvider (const std::string & *name*, SecurityProvider * *provider*)

Registers a new provider with this map.

Parameters:

name A name to associate the provider with

provider the provider object to store in the map.

6.598.2.5 void decaf::security_provider::SecurityProviderMap::unregisterSecurityProvider (const std::string & *name*)

Unregisters a provider from this map.

Parameters:

name the name of the provider to remove

The documentation for this class was generated from the following file:

- src/main/decaf/security_provider/**SecurityProviderMap.h**

6.599 decaf::security_provider::SecurityProviderRegistrar Class Reference

Registers the passed in provider into the provider map, this class can manage the lifetime of the registered provider (default behaviour).

`#include <src/main/decaf/security_provider/SecurityProviderRegistrar.h>`

Public Member Functions

- **SecurityProviderRegistrar** (const std::string &name, **SecurityProvider** *provider, bool manageLifetime=true)

  Creates a registrar and registers the provider with the provider map.

- virtual ~**SecurityProviderRegistrar** ()

  Unregisters the provider from the provider map and destroys it if `manageLifetime` is set.

- virtual **SecurityProvider** * **getProvider** ()

  get a reference to the factory that this class is holding

6.599.1 Detailed Description

Registers the passed in provider into the provider map, this class can manage the lifetime of the registered provider (default behaviour).

6.599.2 Constructor & Destructor Documentation

6.599.2.1 decaf::security_provider::SecurityProviderRegistrar::SecurityProviderRegistrar (const std::string & *name*, SecurityProvider * *provider*, bool *manageLifetime* = `true`) `[inline]`

Creates a registrar and registers the provider with the provider map.

Parameters:

name name of the provider to register

provider the provider object

manageLifetime boolean indicating if this object manages the lifetime of the factory that is being registered.

References decaf::security_provider::SecurityProviderMap::getInstance().

6.599.2.2 virtual decaf::security_provider::SecurityProviderRegistrar::~SecurityProviderRegistrar () `[inline, virtual]`

Unregisters the provider from the provider map and destroys it if `manageLifetime` is set.

References decaf::security_provider::SecurityProviderMap::getInstance().

6.599.3 Member Function Documentation

6.599.3.1 virtual SecurityProvider* decaf::security_provider::SecurityProviderRegistrar::getProvider () [inline, virtual]

get a reference to the factory that this class is holding

Returns:

reference to a factory class

The documentation for this class was generated from the following file:

6.600 decaf::util::concurrent::Semaphore Class Reference

A counting semaphore.

`#include <src/main/decaf/util/concurrent/Semaphore.h>`

Public Member Functions

- **Semaphore** (int permits)

  *Creates a **Semaphore** (p. 2827) with the given number of permits and nonfair fairness setting.*

- **Semaphore** (int permits, bool fair)

  *Creates a **Semaphore** (p. 2827) with the given number of permits and the given fairness setting.*

- virtual ~**Semaphore** ()
- void **acquire** () throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::RuntimeException)

  Acquires a permit from this semaphore, blocking until one is available, or the thread is interrupted.

- void **acquireUninterruptibly** () throw (decaf::lang::exceptions::RuntimeException)

  Acquires a permit from this semaphore, blocking until one is available.

- bool **tryAcquire** () throw (decaf::lang::exceptions::RuntimeException)

  Acquires a permit from this semaphore, only if one is available at the time of invocation.

- bool **tryAcquire** (long long timeout, const **TimeUnit** &unit) throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::RuntimeException)

  Acquires a permit from this semaphore, if one becomes available within the given waiting time and the current thread has not been interrupted.

- void **release** () throw (decaf::lang::exceptions::RuntimeException)

  Releases a permit, returning it to the semaphore.

- void **acquire** (int permits) throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)

  Acquires the given number of permits from this semaphore, blocking until all are available, or the thread is interrupted.

- void **acquireUninterruptibly** (int permits) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)

  Acquires the given number of permits from this semaphore, blocking until all are available.

- bool **tryAcquire** (int permits) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)

  Acquires the given number of permits from this semaphore, only if all are available at the time of invocation.

- bool **tryAcquire** (int permits, long long timeout, const **TimeUnit** &unit) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)

Acquires the given number of permits from this semaphore, if all become available within the given waiting time and the current thread has not been interrupted.

- void **release** (int permits) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)

  Releases the given number of permits, returning them to the semaphore.

- int **availablePermits** () const

  Returns the current number of permits available in this semaphore.

- int **drainPermits** () throw (decaf::lang::exceptions::RuntimeException)

  Acquires and returns all permits that are immediately available.

- bool **isFair** () const
- std::string **toString** () const

  Returns a string identifying this semaphore, as well as its state.

6.600.1 Detailed Description

A counting semaphore. Conceptually, a semaphore maintains a set of permits. Each **acquire()** (p. 2830) blocks if necessary until a permit is available, and then takes it. Each **release()** (p. 2833) adds a permit, potentially releasing a blocking acquirer. However, no actual permit objects are used; the **Semaphore** (p. 2827) just keeps a count of the number available and acts accordingly.

Semaphores are often used to restrict the number of threads than can access some (physical or logical) resource.

class Pool { private:

static const int MAX_AVAILABLE = 100; **Semaphore** (p. 2827) available;

std::vector<std::string> items; std::vector<bool> used;

Mutex (p. 2385) lock;

public:

Pool() : available(MAX_AVAILABLE, true) { used.resize(MAX_AVAILABLE); items.resize(MAX_AVAILABLE); }

std::string getItem() throws InterruptedException { available.acquire(); return getNextAvailableItem(); }

void putItem(std::string x) { if(markAsUnused(x)) { available.release(); } }

std::string getNextAvailableItem() {

synchronized(&lock) (p. 4126) { for(int i = 0; i < MAX_AVAILABLE; ++i) { if(!used[i]) { used[i] = true; return items[i]; } }

return std::string(); // not reached }

bool markAsUnused(const std::string& item) { **synchronized(&lock)** (p. 4126) { for(int i = 0; i < MAX_AVAILABLE; ++i) { if(item == items[i]) { if(used[i]) { used[i] = false; return true; } else return false; } } } return false; } };

Before obtaining an item each thread must acquire a permit from the semaphore, guaranteeing that an item is available for use. When the thread has finished with the item it is returned back

to the pool and a permit is returned to the semaphore, allowing another thread to acquire that item. Note that no synchronization lock is held when **acquire()** (p. 2830) is called as that would prevent an item from being returned to the pool. The semaphore encapsulates the synchronization needed to restrict access to the pool, separately from any synchronization needed to maintain the consistency of the pool itself.

A semaphore initialized to one, and which is used such that it only has at most one permit available, can serve as a mutual exclusion lock. This is more commonly known as a binary semaphore, because it only has two states: one permit available, or zero permits available. When used in this way, the binary semaphore has the property (unlike many **Lock** (p. 2023) implementations), that the "lock" can be released by a thread other than the owner (as semaphores have no notion of ownership). This can be useful in some specialized contexts, such as deadlock recovery.

The constructor for this class optionally accepts a fairness parameter. When set false, this class makes no guarantees about the order in which threads acquire permits. In particular, barging is permitted, that is, a thread invoking **acquire()** (p. 2830) can be allocated a permit ahead of a thread that has been waiting - logically the new thread places itself at the head of the queue of waiting threads. When fairness is set true, the semaphore guarantees that threads invoking any of the acquire methods are selected to obtain permits in the order in which their invocation of those methods was processed (first-in-first-out; FIFO). Note that FIFO ordering necessarily applies to specific internal points of execution within these methods. So, it is possible for one thread to invoke acquire before another, but reach the ordering point after the other, and similarly upon return from the method. Also note that the untimed tryAcquire methods do not honor the fairness setting, but will take any permits that are available.

Generally, semaphores used to control resource access should be initialized as fair, to ensure that no thread is starved out from accessing a resource. When using semaphores for other kinds of synchronization control, the throughput advantages of non-fair ordering often outweigh fairness considerations.

This class also provides convenience methods to acquire and release multiple permits at a time. Beware of the increased risk of indefinite postponement when these methods are used without fairness set true.

Since:

1.0

6.600.2 Constructor & Destructor Documentation

6.600.2.1 decaf::util::concurrent::Semaphore::Semaphore (int *permits*)

Creates a **Semaphore** (p. 2827) with the given number of permits and nonfair fairness setting.

Parameters:

permits the initial number of permits available. This value may be negative, in which case releases must occur before any acquires will be granted.

6.600.2.2 decaf::util::concurrent::Semaphore::Semaphore (int *permits*, bool *fair*)

Creates a **Semaphore** (p. 2827) with the given number of permits and the given fairness setting.

Parameters:

permits the initial number of permits available. This value may be negative, in which case releases must occur before any acquires will be granted.

fair true if this semaphore will guarantee first-in first-out granting of permits under contention, else false

6.600.2.3 virtual decaf::util::concurrent::Semaphore::~Semaphore () [virtual]

6.600.3 Member Function Documentation

6.600.3.1 void decaf::util::concurrent::Semaphore::acquire (int *permits*) throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)

Acquires the given number of permits from this semaphore, blocking until all are available, or the thread is interrupted. Acquires the given number of permits, if they are available, and returns immediately, reducing the number of available permits by the given amount.

If insufficient permits are available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

* Some other thread invokes one of the release methods for this semaphore, the current thread is next to be assigned permits and the number of available permits satisfies this request; or * Some other thread interrupts the current thread.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while waiting for a permit,

then InterruptedException is thrown and the current thread's interrupted status is cleared. Any permits that were to be assigned to this thread are instead assigned to other threads trying to acquire permits, as if permits had been made available by a call to **release()** (p. 2833).

Parameters:

permits the number of permits to acquire.

Exceptions:

InterruptedException if the current thread is interrupted.

IllegalArgumentException if the permits argument is negative.

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2827).

6.600.3.2 void decaf::util::concurrent::Semaphore::acquire () throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::RuntimeException)

Acquires a permit from this semaphore, blocking until one is available, or the thread is interrupted. Acquires a permit, if one is available and returns immediately, reducing the number of available permits by one.

If no permit is available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

* Some other thread invokes the **release()** (p. 2833) method for this semaphore and the current thread is next to be assigned a permit; or * Some other thread interrupts the current thread.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while waiting for a permit,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

Exceptions:

InterruptedException - if the current thread is interrupted.

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2827).

6.600.3.3 void decaf::util::concurrent::Semaphore::acquireUninterruptibly (int *permits*) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)

Acquires the given number of permits from this semaphore, blocking until all are available. Acquires the given number of permits, if they are available, and returns immediately, reducing the number of available permits by the given amount.

If insufficient permits are available then the current thread becomes disabled for thread scheduling purposes and lies dormant until some other thread invokes one of the release methods for this semaphore, the current thread is next to be assigned permits and the number of available permits satisfies this request.

If the current thread is interrupted while waiting for permits then it will continue to wait and its position in the queue is not affected. When the thread does return from this method its interrupt status will be set.

Parameters:

permits the number of permits to acquire.

Exceptions:

IllegalArgumentException if the permits argument is negative.

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2827).

6.600.3.4 void decaf::util::concurrent::Semaphore::acquireUninterruptibly () throw (decaf::lang::exceptions::RuntimeException)

Acquires a permit from this semaphore, blocking until one is available. Acquires a permit, if one is available and returns immediately, reducing the number of available permits by one.

If no permit is available then the current thread becomes disabled for thread scheduling purposes and lies dormant until some other thread invokes the **release()** (p. 2833) method for this semaphore and the current thread is next to be assigned a permit.

If the current thread is interrupted while waiting for a permit then it will continue to wait, but the time at which the thread is assigned a permit may change compared to the time it would have received the permit had no interruption occurred. When the thread does return from this method its interrupt status will be set.

Exceptions:

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2827).

6.600.3.5 int decaf::util::concurrent::Semaphore::availablePermits () const

Returns the current number of permits available in this semaphore. This method is typically used for debugging and testing purposes.

Returns:

the number of permits available in this semaphore

6.600.3.6 int decaf::util::concurrent::Semaphore::drainPermits () throw (decaf::lang::exceptions::RuntimeException)

Acquires and returns all permits that are immediately available.

Returns:

the number of permits acquired

Exceptions:

RuntimeException if an unexpected error occurs while draining the **Semaphore** (p. 2827).

6.600.3.7 bool decaf::util::concurrent::Semaphore::isFair () const

Returns:

true if this semaphore has fairness set true

6.600.3.8 void decaf::util::concurrent::Semaphore::release (int *permits*) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)

Releases the given number of permits, returning them to the semaphore. Releases the given number of permits, increasing the number of available permits by that amount. If any threads are trying to acquire permits, then one is selected and given the permits that were just released. If the number of available permits satisfies that thread's request then that thread is (re)enabled for thread scheduling purposes; otherwise the thread will wait until sufficient permits are available. If there are still permits available after this thread's request has been satisfied, then those permits are assigned in turn to other threads trying to acquire permits.

Parameters:

permits the number of permits to release

Exceptions:

IllegalArgumentException if the permits argument is negative.

RuntimeException if an unexpected error occurs while releasing the **Semaphore** (p. 2827).

6.600.3.9 void decaf::util::concurrent::Semaphore::release () throw (decaf::lang::exceptions::RuntimeException)

Releases a permit, returning it to the semaphore. Releases a permit, increasing the number of available permits by one. If any threads are trying to acquire a permit, then one is selected and given the permit that was just released. That thread is (re)enabled for thread scheduling purposes.

There is no requirement that a thread that releases a permit must have acquired that permit by calling **acquire()** (p. 2830). Correct usage of a semaphore is established by programming convention in the application.

Exceptions:

RuntimeException if an unexpected error occurs while releasing the **Semaphore** (p. 2827).

6.600.3.10 std::string decaf::util::concurrent::Semaphore::toString () const

Returns a string identifying this semaphore, as well as its state. The state, in brackets, includes the String "Permits =" followed by the number of permits.

Returns:

a string identifying this semaphore, as well as its state

6.600.3.11 bool decaf::util::concurrent::Semaphore::tryAcquire (int *permits*, long long *timeout*, const TimeUnit & *unit*) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)

Acquires the given number of permits from this semaphore, if all become available within the given waiting time and the current thread has not been interrupted. Acquires the given number of permits, if they are available and returns immediately, with the value true, reducing the number of available permits by the given amount.

If insufficient permits are available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

∗ Some other thread invokes one of the release methods for this semaphore, the current thread is next to be assigned permits and the number of available permits satisfies this request; or ∗ Some other thread interrupts the current thread; or ∗ The specified waiting time elapses.

If the permits are acquired then the value true is returned.

If the current thread:

∗ has its interrupted status set on entry to this method; or ∗ is interrupted while waiting to acquire the permits,

then InterruptedException is thrown and the current thread's interrupted status is cleared. Any permits that were to be assigned to this thread, are instead assigned to other threads trying to acquire permits, as if the permits had been made available by a call to **release()** (p. 2833).

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all. Any permits that were to be assigned to this thread, are instead assigned to other threads trying to acquire permits, as if the permits had been made available by a call to **release()** (p. 2833).

Parameters:

permits the number of permits to acquire

timeout the maximum amount of time to wait to acquire the permits.

unit the units that the timeout param represents.

Returns:

true if all permits were acquired and false if the waiting time elapsed before all permits were acquired

Exceptions:

IllegalArgumentException if the permits argument is negative.

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2827).

6.600.3.12 bool decaf::util::concurrent::Semaphore::tryAcquire (int *permits*) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)

Acquires the given number of permits from this semaphore, only if all are available at the time of invocation. Acquires the given number of permits, if they are available, and returns immediately, with the value true, reducing the number of available permits by the given amount.

If insufficient permits are available then this method will return immediately with the value false and the number of available permits is unchanged.

Even when this semaphore has been set to use a fair ordering policy, a call to tryAcquire will immediately acquire a permit if one is available, whether or not other threads are currently waiting. This "barging" behavior can be useful in certain circumstances, even though it breaks fairness. If you want to honor the fairness setting, then use tryAcquire(permits, 0, **TimeUnit.SECONDS** (p. 3214)) which is almost equivalent (it also detects interruption).

Parameters:

permits the number of permits to acquire

Returns:

true if the permits were acquired and false otherwise.

Exceptions:

IllegalArgumentException if the permits argument is negative.

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2827).

6.600.3.13 bool decaf::util::concurrent::Semaphore::tryAcquire (long long *timeout*, const TimeUnit & *unit*) throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::RuntimeException)

Acquires a permit from this semaphore, if one becomes available within the given waiting time and the current thread has not been interrupted. Acquires a permit, if one is available and returns immediately, with the value true, reducing the number of available permits by one.

If no permit is available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

∗ Some other thread invokes the **release()** (p. 2833) method for this semaphore and the current thread is next to be assigned a permit; or ∗ Some other thread interrupts the current thread; or ∗ The specified waiting time elapses.

If a permit is acquired then the value true is returned.

If the current thread:

∗ has its interrupted status set on entry to this method; or ∗ is interrupted while waiting to acquire a permit,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

Parameters:

timeout the maximum time to wait for a permit

unit the time unit of the timeout argument

Returns:

true if a permit was acquired and false if the waiting time elapsed before a permit was acquired

Exceptions:

InterruptedException if the current thread is interrupted.

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2827).

6.600.3.14 bool decaf::util::concurrent::Semaphore::tryAcquire () throw (decaf::lang::exceptions::RuntimeException)

Acquires a permit from this semaphore, only if one is available at the time of invocation. Acquires a permit, if one is available and returns immediately, with the value true, reducing the number of available permits by one.

If no permit is available then this method will return immediately with the value false.

Even when this semaphore has been set to use a fair ordering policy, a call to **tryAcquire()** (p. 2835) will immediately acquire a permit if one is available, whether or not other threads are currently waiting. This "barging" behavior can be useful in certain circumstances, even though it breaks fairness. If you want to honor the fairness setting, then use tryAcquire(0, **TimeUnit.SECONDS** (p. 3214)) which is almost equivalent (it also detects interruption).

Returns:

true if a permit was acquired and false otherwise

Exceptions:

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2827).

6.602 decaf::net::ServerSocket Class Reference

A server socket class (for testing purposes).

`#include <src/main/decaf/net/ServerSocket.h>`

Public Types

- typedef apr_socket_t * **SocketHandle**
- typedef apr_sockaddr_t * **SocketAddress**

Public Member Functions

- **ServerSocket** ()

  Constructor.

- virtual ~**ServerSocket** ()

  Destructor.

- virtual void **bind** (const char *host, int port) throw (SocketException)

  Bind and listen to given IP/dns and port.

- virtual void **bind** (const char *host, int port, int backlog) throw (SocketException)

  Bind and listen to given IP/dns and port.

- virtual **Socket** * **accept** () throw (SocketException)

  Blocks until a client connects to the bound socket.

- virtual void **close** () throw (lang::Exception)

  Closes the server socket.

- virtual bool **isBound** () const

6.602.1 Detailed Description

A server socket class (for testing purposes).

6.602.2 Member Typedef Documentation

6.602.2.1 typedef apr_sockaddr_t* decaf::net::ServerSocket::SocketAddress

6.602.2.2 typedef apr_socket_t* decaf::net::ServerSocket::SocketHandle

6.602.3 Constructor & Destructor Documentation

6.602.3.1 decaf::net::ServerSocket::ServerSocket ()

Constructor. Creates a non-bound server socket.

6.602.3.2 virtual decaf::net::ServerSocket::~ServerSocket () [virtual]

Destructor. Releases socket handle if **close()** (p. 2838) hasn't been called.

6.602.4 Member Function Documentation

6.602.4.1 virtual Socket* decaf::net::ServerSocket::accept () throw (SocketException) [virtual]

Blocks until a client connects to the bound socket.

Returns:

new socket. Never returns NULL.

6.602.4.2 virtual void decaf::net::ServerSocket::bind (const char * *host*, int *port*, int *backlog*) throw (SocketException) [virtual]

Bind and listen to given IP/dns and port.

Parameters:

host IP address or host name.

port TCP port between 1..655535

backlog Size of listen backlog.

6.602.4.3 virtual void decaf::net::ServerSocket::bind (const char * *host*, int *port*) throw (SocketException) [virtual]

Bind and listen to given IP/dns and port.

Parameters:

host IP address or host name.

port TCP port between 1..655535

6.602.4.4 virtual void decaf::net::ServerSocket::close () throw (lang::Exception) [virtual]

Closes the server socket.

6.602.4.5 virtual bool decaf::net::ServerSocket::isBound () const [virtual]

Returns:

true of the server socket is bound.

The documentation for this class was generated from the following file:

- src/main/decaf/net/**ServerSocket.h**

6.603 cms::Session Class Reference

A **Session** (p. 2839) object is a single-threaded context for producing and consuming messages.

`#include <src/main/cms/Session.h>`Inheritance diagram for cms::Session:

Public Types

- enum **AcknowledgeMode** {
  AUTO_ACKNOWLEDGE, **DUPS_OK_ACKNOWLEDGE**, **CLIENT_ACKNOWLEDGE**, **SESSION_TRANSACTED**,
  INDIVIDUAL_ACKNOWLEDGE }

Public Member Functions

- virtual ~**Session** ()
- virtual void **close** ()=0 throw (CMSException)

  Closes this session as well as any active child consumers or producers.

- virtual void **commit** ()=0 throw (CMSException)

  Commits all messages done in this transaction and releases any locks currently held.

- virtual void **rollback** ()=0 throw (CMSException)

  Rolls back all messages done in this transaction and releases any locks currently held.

- virtual void **recover** ()=0 throw (CMSException)

  Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.

- virtual **MessageConsumer** * **createConsumer** (const **Destination** *destination)=0 throw (CMSException)

  *Creates a **MessageConsumer** (p. 2214) for the specified destination.*

- virtual **MessageConsumer** * **createConsumer** (const **Destination** *destination, const std::string &selector)=0 throw (CMSException)

  *Creates a **MessageConsumer** (p. 2214) for the specified destination, using a message selector.*

- virtual **MessageConsumer** * **createConsumer** (const **Destination** *destination, const std::string &selector, bool noLocal)=0 throw (CMSException)

  *Creates a **MessageConsumer** (p. 2214) for the specified destination, using a message selector.*

- virtual **MessageConsumer** * **createDurableConsumer** (const **Topic** *destination, const std::string &name, const std::string &selector, bool noLocal=false)=0 throw (CMSException)

  *Creates a durable subscriber to the specified topic, using a **Message** (p. 2163) selector.*

- virtual **MessageProducer** * **createProducer** (const **Destination** *destination)=0 throw (CMSException)

*Creates a **MessageProducer** (p. 2332) to send messages to the specified destination.*

- virtual **QueueBrowser** * **createBrowser** (const **cms::Queue** *queue)=0 throw (CMSException)

  *Creates a new **QueueBrowser** (p. 2675) to peek at Messages on the given **Queue** (p. 2674).*

- virtual **QueueBrowser** * **createBrowser** (const **cms::Queue** *queue, const std::string &selector)=0 throw (CMSException)

  *Creates a new **QueueBrowser** (p. 2675) to peek at Messages on the given **Queue** (p. 2674).*

- virtual **Queue** * **createQueue** (const std::string &queueName)=0 throw (CMSException)

  *Creates a queue identity given a **Queue** (p. 2674) name.*

- virtual **Topic** * **createTopic** (const std::string &topicName)=0 throw (CMSException)

  *Creates a topic identity given a **Queue** (p. 2674) name.*

- virtual **TemporaryQueue** * **createTemporaryQueue** ()=0 throw (CMSException)

  *Creates a **TemporaryQueue** (p. 3166) object.*

- virtual **TemporaryTopic** * **createTemporaryTopic** ()=0 throw (CMSException)

  *Creates a **TemporaryTopic** (p. 3168) object.*

- virtual **Message** * **createMessage** ()=0 throw (CMSException)

  *Creates a new **Message** (p. 2163).*

- virtual **BytesMessage** * **createBytesMessage** ()=0 throw (CMSException)

  *Creates a **BytesMessage** (p. 938).*

- virtual **BytesMessage** * **createBytesMessage** (const unsigned char *bytes, std::size_t bytesSize)=0 throw (CMSException)

  *Creates a **BytesMessage** (p. 938) and sets the payload to the passed value.*

- virtual **StreamMessage** * **createStreamMessage** ()=0 throw (CMSException)

  *Creates a new **StreamMessage** (p. 3081).*

- virtual **TextMessage** * **createTextMessage** ()=0 throw (CMSException)

  *Creates a new **TextMessage** (p. 3170).*

- virtual **TextMessage** * **createTextMessage** (const std::string &text)=0 throw (CMSException)

  *Creates a new **TextMessage** (p. 3170) and set the text to the value given.*

- virtual **MapMessage** * **createMapMessage** ()=0 throw (CMSException)

  *Creates a new **MapMessage** (p. 2106).*

- virtual **AcknowledgeMode** **getAcknowledgeMode** () const =0 throw (CMSException)

  Returns the acknowledgment mode of the session.

- virtual bool **isTransacted** () const =0 throw (CMSException)

  *Gets if the Sessions is a Transacted **Session** (p. 2839).*

- virtual void **unsubscribe** (const std::string &name)=0 throw (CMSException)

  Unsubscribes a durable subscription that has been created by a client.

6.603.1 Detailed Description

A **Session** (p. 2839) object is a single-threaded context for producing and consuming messages. A session serves several purposes:

- It is a factory for its message producers and consumers.
- It supplies provider-optimized message factories.
- It is a factory for TemporaryTopics and TemporaryQueues.
- It provides a way to create **Queue** (p. 2674) or **Topic** (p. 3215) objects for those clients that need to dynamically manipulate provider-specific destination names.
- It supports a single series of transactions that combine work spanning its producers and consumers into atomic units.
- It defines a serial order for the messages it consumes and the messages it produces.
- It retains messages it consumes until they have been acknowledged.
- It serializes execution of message listeners registered with its message consumers.

A session can create and service multiple message producers and consumers.

One typical use is to have a thread block on a synchronous **MessageConsumer** (p. 2214) until a message arrives. The thread may then use one or more of the Session's MessageProducers.

If a client desires to have one thread produce messages while others consume them, the client should use a separate session for its producing thread.

Certain rules apply to a session's `close` method and are detailed below.

- There is no need to close the producers and consumers of a closed session.
- The close call will block until a receive call or message listener in progress has completed. A blocked message consumer receive call returns null when this session is closed.
- Closing a transacted session must roll back the transaction in progress.
- The close method is the only **Session** (p. 2839) method that can be called concurrently.
- Invoking any other **Session** (p. 2839) method on a closed session must throw an **IllegalStateException** (p. 1729). Closing a closed session must not throw any exceptions.

Transacted Sessions

When a **Session** (p. 2839) is created it can be set to operate in a Transaction based mode. Each **Session** (p. 2839) then operates in a single transaction for all Producers and Consumers of that **Session** (p. 2839). Messages sent and received within a Transaction are grouped into an atomic unit that is committed or rolled back together.

For a **MessageProducer** (p. 2332) this implies that all messages sent by the producer are not sent to the Provider unit the commit call is made. Rolling back the Transaction results in all produced Messages being dropped.

For a **MessageConsumer** (p. 2214) this implies that all received messages are not Acknowledged until the Commit call is made. Rolling back the Transaction results in all Consumed **Message** (p. 2163) being redelivered to the client, the Provider may allow configuration that limits the Maximum number of redeliveries for a **Message** (p. 2163).

Since:

1.0

6.603.2 Member Enumeration Documentation

6.603.2.1 enum cms::Session::AcknowledgeMode

Enumerator:

AUTO_ACKNOWLEDGE With this acknowledgment mode, the session automatically acknowledges a client's receipt of a message either when the session has successfully returned from a call to receive or when the message listener the session has called to process the message successfully returns.

DUPS_OK_ACKNOWLEDGE With this acknowledgment mode, the session automatically acknowledges a client's receipt of a message either when the session has successfully returned from a call to receive or when the message listener the session has called to process the message successfully returns. Acknowledgments may be delayed in this mode to increase performance at the cost of the message being redelivered this client fails.

CLIENT_ACKNOWLEDGE With this acknowledgment mode, the client acknowledges a consumed message by calling the message's acknowledge method.

SESSION_TRANSACTED Messages will be consumed when the transaction commits.

INDIVIDUAL_ACKNOWLEDGE **Message** (p. 2163) will be acknowledged individually. Normally the acks sent acknowledge the given message and all messages received before it, this mode only acknowledges one message.

6.603.3 Constructor & Destructor Documentation

6.603.3.1 virtual cms::Session::~Session () [inline, virtual]

6.603.4 Member Function Documentation

6.603.4.1 virtual void cms::Session::close () throw (CMSException) [pure virtual]

Closes this session as well as any active child consumers or producers.

Exceptions:

CMSException (p. ***1031***) - If an internal error occurs.

Implements **cms::Closeable** (p. 1021).

Implemented in **activemq::cmsutil::PooledSession** (p. 2507), and **activemq::core::ActiveMQSession** (p. 447).

6.603.4.2 virtual void cms::Session::commit () throw (CMSException) [pure virtual]

Commits all messages done in this transaction and releases any locks currently held.

Exceptions:

CMSException *(p. **1031**)* - If an internal error occurs.

IllegalStateException *(p. **1729**)* - if the method is not called by a transacted session.

Implemented in **activemq::cmsutil::PooledSession** (p. 2507), and **activemq::core::ActiveMQSession** (p. 447).

Referenced by activemq::cmsutil::PooledSession::commit().

6.603.4.3 virtual QueueBrowser* cms::Session::createBrowser (const cms::Queue * *queue*, const std::string & *selector*) throw (CMSException) [pure virtual]

Creates a new **QueueBrowser** (p. 2675) to peek at Messages on the given **Queue** (p. 2674).

Parameters:

queue the **Queue** (p. 2674) to browse

selector the **Message** (p. 2163) selector to filter which messages are browsed.

Returns:

New **QueueBrowser** (p. 2675) that is owned by the caller.

Exceptions:

CMSException *(p. **1031**)* - If an internal error occurs.

InvalidDestinationException *(p. **1809**)* - if the destination given is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 2508), and **activemq::core::ActiveMQSession** (p. 447).

6.603.4.4 virtual QueueBrowser* cms::Session::createBrowser (const cms::Queue * *queue*) throw (CMSException) [pure virtual]

Creates a new **QueueBrowser** (p. 2675) to peek at Messages on the given **Queue** (p. 2674).

Parameters:

queue the **Queue** (p. 2674) to browse

Returns:

New **QueueBrowser** (p. 2675) that is owned by the caller.

Exceptions:

CMSException *(*p. ***1031***) - If an internal error occurs.

InvalidDestinationException *(*p. ***1809***) - if the destination given is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 2508), and **activemq::core::ActiveMQSession** (p. 448).

6.603.4.5 virtual BytesMessage* cms::Session::createBytesMessage (const unsigned char * *bytes*, std::size_t *bytesSize*) throw (CMSException) [pure virtual]

Creates a **BytesMessage** (p. 938) and sets the payload to the passed value.

Parameters:

bytes an array of bytes to set in the message

bytesSize the size of the bytes array, or number of bytes to use

Exceptions:

CMSException *(*p. ***1031***) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2509), and **activemq::core::ActiveMQSession** (p. 448).

6.603.4.6 virtual BytesMessage* cms::Session::createBytesMessage () throw (CMSException) [pure virtual]

Creates a **BytesMessage** (p. 938).

Exceptions:

CMSException *(*p. ***1031***) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2509), and **activemq::core::ActiveMQSession** (p. 449).

Referenced by activemq::cmsutil::PooledSession::createBytesMessage().

6.603.4.7 virtual MessageConsumer* cms::Session::createConsumer (const Destination * *destination*, const std::string & *selector*, bool *noLocal*) throw (CMSException) [pure virtual]

Creates a **MessageConsumer** (p. 2214) for the specified destination, using a message selector.

Parameters:

destination the **Destination** (p. 1480) that this consumer receiving messages for.

selector the **Message** (p. 2163) Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns:

pointer to a new **MessageConsumer** (p. 2214) that is owned by the caller (caller deletes)

Exceptions:

CMSException *(p. **1031**)* - If an internal error occurs.

InvalidDestinationException *(p. **1809**)* - if an invalid destination is specified.

InvalidSelectorException *(p. **1816**)* - if the message selector is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 2510), and **activemq::core::ActiveMQSession** (p. 449).

6.603.4.8 virtual MessageConsumer* cms::Session::createConsumer (const Destination * *destination*, const std::string & *selector*) throw (CMSException) [pure virtual]

Creates a **MessageConsumer** (p. 2214) for the specified destination, using a message selector.

Parameters:

destination the **Destination** (p. 1480) that this consumer receiving messages for.

selector the **Message** (p. 2163) Selector to use

Returns:

pointer to a new **MessageConsumer** (p. 2214) that is owned by the caller (caller deletes)

Exceptions:

CMSException *(p. **1031**)* - If an internal error occurs.

InvalidDestinationException *(p. **1809**)* - if an invalid destination is specified.

InvalidSelectorException *(p. **1816**)* - if the message selector is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 2510), and **activemq::core::ActiveMQSession** (p. 449).

6.603.4.9 virtual MessageConsumer* cms::Session::createConsumer (const Destination * *destination*) throw (CMSException) [pure virtual]

Creates a **MessageConsumer** (p. 2214) for the specified destination.

Parameters:

destination the **Destination** (p. 1480) that this consumer receiving messages for.

Returns:

pointer to a new **MessageConsumer** (p. 2214) that is owned by the caller (caller deletes)

Exceptions:

CMSException *(p. **1031**)* - If an internal error occurs.

InvalidDestinationException *(*p. ***1809***) - if an invalid destination is specified.

Implemented in **activemq::cmsutil::PooledSession** (p. 2511), and **activemq::core::ActiveMQSession** (p. 450).

Referenced by activemq::cmsutil::PooledSession::createConsumer().

6.603.4.10 virtual MessageConsumer* cms::Session::createDurableConsumer (const Topic * *destination*, const std::string & *name*, const std::string & *selector*, bool *noLocal* = `false`) throw (CMSException) `[pure virtual]`

Creates a durable subscriber to the specified topic, using a **Message** (p. 2163) selector. Sessions that create durable consumers must use the same client Id as was used the last time the subscription was created in order to receive all messages that were delivered while the client was offline.

Parameters:

destination the topic to subscribe to

name The name used to identify the subscription

selector the **Message** (p. 2163) Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns:

pointer to a new durable **MessageConsumer** (p. 2214) that is owned by the caller (caller deletes)

Exceptions:

CMSException *(*p. ***1031***) - If an internal error occurs.

InvalidDestinationException *(*p. ***1809***) - if an invalid destination is specified.

InvalidSelectorException *(*p. ***1816***) - if the message selector is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 2511), and **activemq::core::ActiveMQSession** (p. 450).

Referenced by activemq::cmsutil::PooledSession::createDurableConsumer().

6.603.4.11 virtual MapMessage* cms::Session::createMapMessage () throw (CMSException) `[pure virtual]`

Creates a new **MapMessage** (p. 2106).

Exceptions:

CMSException *(*p. ***1031***) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2512), and **activemq::core::ActiveMQSession** (p. 450).

Referenced by activemq::cmsutil::PooledSession::createMapMessage().

6.603.4.12 virtual Message* cms::Session::createMessage () throw (CMSException) [pure virtual]

Creates a new **Message** (p. 2163).

Exceptions:

CMSException *(p. **1031**)* - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2512), and **activemq::core::ActiveMQSession** (p. 451).

Referenced by activemq::cmsutil::PooledSession::createMessage().

6.603.4.13 virtual MessageProducer* cms::Session::createProducer (const Destination * *destination*) throw (CMSException) [pure virtual]

Creates a **MessageProducer** (p. 2332) to send messages to the specified destination.

Parameters:

destination the **Destination** (p. 1480) to send on

Returns:

New **MessageProducer** (p. 2332) that is owned by the caller.

Exceptions:

CMSException *(p. **1031**)* - If an internal error occurs.

InvalidDestinationException *(p. **1809**)* - if an invalid destination is specified.

Implemented in **activemq::cmsutil::PooledSession** (p. 2512), and **activemq::core::ActiveMQSession** (p. 451).

Referenced by activemq::cmsutil::PooledSession::createProducer().

6.603.4.14 virtual Queue* cms::Session::createQueue (const std::string & *queueName*) throw (CMSException) [pure virtual]

Creates a queue identity given a **Queue** (p. 2674) name.

Parameters:

queueName the name of the new **Queue** (p. 2674)

Returns:

new **Queue** (p. 2674) pointer that is owned by the caller.

Exceptions:

CMSException *(p. **1031**)* - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2513), and **activemq::core::ActiveMQSession** (p. 451).

Referenced by activemq::cmsutil::PooledSession::createQueue().

6.603.4.15 virtual StreamMessage* cms::Session::createStreamMessage () throw (CMSException) [pure virtual]

Creates a new **StreamMessage** (p. 3081).

Exceptions:

CMSException *(p. **1031**)* - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2513), and **activemq::core::ActiveMQSession** (p. 451).

Referenced by activemq::cmsutil::PooledSession::createStreamMessage().

6.603.4.16 virtual TemporaryQueue* cms::Session::createTemporaryQueue () throw (CMSException) [pure virtual]

Creates a **TemporaryQueue** (p. 3166) object.

Returns:

new **TemporaryQueue** (p. 3166) pointer that is owned by the caller.

Exceptions:

CMSException *(p. **1031**)* - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2514), and **activemq::core::ActiveMQSession** (p. 452).

Referenced by activemq::cmsutil::PooledSession::createTemporaryQueue().

6.603.4.17 virtual TemporaryTopic* cms::Session::createTemporaryTopic () throw (CMSException) [pure virtual]

Creates a **TemporaryTopic** (p. 3168) object.

Exceptions:

CMSException *(p. **1031**)* - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2514), and **activemq::core::ActiveMQSession** (p. 452).

Referenced by activemq::cmsutil::PooledSession::createTemporaryTopic().

6.603.4.18 virtual TextMessage* cms::Session::createTextMessage (const std::string & *text*) throw (CMSException) [pure virtual]

Creates a new **TextMessage** (p. 3170) and set the text to the value given.

Parameters:

text the initial text for the message

Exceptions:

CMSException *(*p. *1031)* - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2514), and **activemq::core::ActiveMQSession** (p. 452).

6.603.4.19 virtual TextMessage* cms::Session::createTextMessage () throw (CMSException) [pure virtual]

Creates a new **TextMessage** (p. 3170).

Exceptions:

CMSException *(*p. *1031)* - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2514), and **activemq::core::ActiveMQSession** (p. 452).

Referenced by activemq::cmsutil::PooledSession::createTextMessage().

6.603.4.20 virtual Topic* cms::Session::createTopic (const std::string & *topicName*) throw (CMSException) [pure virtual]

Creates a topic identity given a **Queue** (p. 2674) name.

Parameters:

topicName the name of the new **Topic** (p. 3215)

Returns:

new **Topic** (p. 3215) pointer that is owned by the caller.

Exceptions:

CMSException *(*p. *1031)* - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2515), and **activemq::core::ActiveMQSession** (p. 453).

Referenced by activemq::cmsutil::PooledSession::createTopic().

6.603.4.21 virtual AcknowledgeMode cms::Session::getAcknowledgeMode () const throw (CMSException) [pure virtual]

Returns the acknowledgment mode of the session.

Returns:

the Sessions Acknowledge Mode

Exceptions:

CMSException *(*p. *1031)* - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2515), and **activemq::core::ActiveMQSession** (p. 454).

Referenced by activemq::cmsutil::PooledSession::getAcknowledgeMode().

6.603.4.22 virtual bool cms::Session::isTransacted () const throw (CMSException) [pure virtual]

Gets if the Sessions is a Transacted **Session** (p. 2839).

Returns:

transacted true - false.

Exceptions:

CMSException (p. ***1031***) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2516), and **activemq::core::ActiveMQSession** (p. 456).

Referenced by activemq::cmsutil::PooledSession::isTransacted().

6.603.4.23 virtual void cms::Session::recover () throw (CMSException) [pure virtual]

Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message. All consumers deliver messages in a serial order. Acknowledging a received message automatically acknowledges all messages that have been delivered to the client.

Restarting a session causes it to take the following actions:

- Stop message delivery
- Mark all messages that might have been delivered but not acknowledged as "redelivered"
- Restart the delivery sequence including all unacknowledged messages that had been previously delivered. Redelivered messages do not have to be delivered in exactly their original delivery order.

Exceptions:

CMSException (p. ***1031***) - if the CMS provider fails to stop and restart message delivery due to some internal error.

IllegalStateException (p. ***1729***) - if the method is called by a transacted session.

Implemented in **activemq::cmsutil::PooledSession** (p. 2516), and **activemq::core::ActiveMQSession** (p. 456).

Referenced by activemq::cmsutil::PooledSession::recover().

6.603.4.24 virtual void cms::Session::rollback () throw (CMSException) [pure virtual]

Rolls back all messages done in this transaction and releases any locks currently held.

Exceptions:

CMSException *(*p. ***1031****)* - If an internal error occurs.

IllegalStateException *(*p. ***1729****)* - if the method is not called by a transacted session.

Implemented in **activemq::cmsutil::PooledSession** (p. 2517), and **activemq::core::ActiveMQSession** (p. 457).

Referenced by activemq::cmsutil::PooledSession::rollback().

6.603.4.25 virtual void cms::Session::unsubscribe (const std::string & *name*) throw (CMSException) [pure virtual]

Unsubscribes a durable subscription that has been created by a client. This method deletes the state being maintained on behalf of the subscriber by its provider. It is erroneous for a client to delete a durable subscription while there is an active **MessageConsumer** (p. 2214) or Subscriber for the subscription, or while a consumed message is part of a pending transaction or has not been acknowledged in the session.

Parameters:

name The name used to identify this subscription

Exceptions:

CMSException *(*p. ***1031****)* - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2517), and **activemq::core::ActiveMQSession** (p. 458).

Referenced by activemq::cmsutil::PooledSession::unsubscribe().

6.604 activemq::cmsutil::SessionCallback Class Reference

Callback for executing any number of operations on a provided CMS Session.

`#include <src/main/activemq/cmsutil/SessionCallback.h>`Inheritance diagram for activemq::cmsutil::SessionCallback:

Public Member Functions

- virtual ~**SessionCallback** ()
- virtual void **doInCms** (**cms::Session** *session)=0 throw (cms::CMSException)

  Execute any number of operations against the supplied CMS session.

6.604.1 Detailed Description

Callback for executing any number of operations on a provided CMS Session.

6.604.2 Constructor & Destructor Documentation

6.604.2.1 virtual activemq::cmsutil::SessionCallback::~SessionCallback () [inline, virtual]

6.604.3 Member Function Documentation

6.604.3.1 virtual void activemq::cmsutil::SessionCallback::doInCms (cms::Session * *session*) throw (cms::CMSException) [pure virtual]

Execute any number of operations against the supplied CMS session.

Parameters:

session the CMS `Session`

Exceptions:

cms::CMSException *(*p. ***1031****)* if thrown by CMS API methods

Implemented in **activemq::cmsutil::CmsTemplate::ProducerExecutor** (p. 2604), and **activemq::cmsutil::CmsTemplate::ReceiveExecutor** (p. 2690).

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**SessionCallback.h**

6.605.2 Constructor & Destructor Documentation

6.605.2.1 activemq::commands::SessionId::SessionId ()

6.605.2.2 activemq::commands::SessionId::SessionId (const SessionId & *other*)

6.605.2.3 activemq::commands::SessionId::SessionId (const ConnectionId * *connectionId*, long long *sessionId*)

6.605.2.4 activemq::commands::SessionId::SessionId (const ProducerId * *producerId*)

6.605.2.5 activemq::commands::SessionId::SessionId (const ConsumerId * *consumerId*)

6.605.2.6 virtual activemq::commands::SessionId::~SessionId () [virtual]

6.605.3 Member Function Documentation

6.605.3.1 virtual SessionId* activemq::commands::SessionId::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.605.3.2 virtual int activemq::commands::SessionId::compareTo (const SessionId & *value*) const [virtual]

6.605.3.3 virtual void activemq::commands::SessionId::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Implements **activemq::commands::DataStructure** (p. 1462).

6.605.3.4 virtual bool activemq::commands::SessionId::equals (const SessionId & *value*) const [virtual]

6.605.3.5 virtual bool activemq::commands::SessionId::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1463).

6.605.3.6 virtual std::string& activemq::commands::SessionId::getConnectionId () [virtual]

6.605.3.7 virtual const std::string& activemq::commands::SessionId::getConnectionId () const [virtual]

Referenced by activemq::commands::ConsumerId::ConsumerId(), and activemq::commands::ProducerId::ProducerId().

6.605.3.8 virtual unsigned char activemq::commands::SessionId::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.605.3.9 const Pointer<ConnectionId>& activemq::commands::SessionId::getParentId () const

6.605.3.10 virtual long long activemq::commands::SessionId::getValue () const [virtual]

Referenced by activemq::commands::ConsumerId::ConsumerId(), and activemq::commands::ProducerId::ProducerId().

6.605.3.11 virtual bool activemq::commands::SessionId::operator< (const SessionId & *value*) const [virtual]

6.605.3.12 SessionId& activemq::commands::SessionId::operator= (const SessionId & *other*)

6.605.3.13 virtual bool activemq::commands::SessionId::operator== (const SessionId & *value*) const [virtual]

6.605.3.14 virtual void activemq::commands::SessionId::setConnectionId (const std::string & *connectionId*) [virtual]

6.605.3.15 virtual void activemq::commands::SessionId::setValue (long long *value*) [virtual]

6.605.3.16 virtual std::string activemq::commands::SessionId::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 718).

6.605.4 Field Documentation

6.605.4.1 std::string activemq::commands::SessionId::connectionId [protected]

  Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.606.1 Detailed Description

Marshaling code for Open Wire Format for **SessionIdMarshaller** (p. 2857). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.606.2 Constructor & Destructor Documentation

6.606.2.1 activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::SessionIdMarshaller () [inline]

6.606.2.2 virtual activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::~SessionIdMarshaller () [inline, virtual]

6.606.3 Member Function Documentation

6.606.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.606.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.606.3.3 virtual void activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.606.3.4 virtual void activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.606.3.5 virtual int activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.606.3.6 virtual void activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.606.3.7 virtual void activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

The documentation for this class was generated from the following file:

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.607.1 Detailed Description

Marshaling code for Open Wire Format for **SessionIdMarshaller** (p. 2861). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.607.2 Constructor & Destructor Documentation

6.607.2.1 activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::SessionIdMarshaller () [inline]

6.607.2.2 virtual activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::~SessionIdMarshaller () [inline, virtual]

6.607.3 Member Function Documentation

6.607.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.607.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.607.3.3 virtual void activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.607.3.4 virtual void activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.607.3.5 virtual int activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.607.3.6 virtual void activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.607.3.7 virtual void activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

6.608.3 Member Function Documentation

6.608.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.608.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.608.3.3 virtual void activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.608.3.4 virtual void activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.608.3.5 virtual int activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.608.3.6 virtual void activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.608.3.7 virtual void activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.609.3.4 virtual void activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.609.3.5 virtual int activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.609.3.6 virtual void activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.609.3.7 virtual void activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

6.610.3 Member Function Documentation

6.610.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.610.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.610.3.3 virtual void activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.610.3.4 virtual void activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.610.3.5 virtual int activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.610.3.6 virtual void activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.610.3.7 virtual void activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

6.611.1 Constructor & Destructor Documentation

6.611.1.1 activemq::commands::SessionInfo::SessionInfo (const SessionInfo &) [inline, protected]

6.611.1.2 activemq::commands::SessionInfo::SessionInfo ()

6.611.1.3 virtual activemq::commands::SessionInfo::~SessionInfo () [virtual]

6.611.2 Member Function Documentation

6.611.2.1 virtual SessionInfo* activemq::commands::SessionInfo::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.611.2.2 virtual void activemq::commands::SessionInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.611.2.3 virtual bool activemq::commands::SessionInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.611.2.4 unsigned int activemq::commands::SessionInfo::getAckMode () const [inline]

6.611.2.5 virtual unsigned char activemq::commands::SessionInfo::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.611.2.6 virtual Pointer<SessionId>& activemq::commands::SessionInfo::getSessionId () [virtual]

6.611.2.7 virtual const Pointer<SessionId>& activemq::commands::SessionInfo::getSessionId () const [virtual]

6.611.2.8 SessionInfo& activemq::commands::SessionInfo::operator= (const SessionInfo &) [inline, protected]

6.611.2.9 void activemq::commands::SessionInfo::setAckMode (unsigned int *mode*) [inline]

6.611.2.10 virtual void activemq::commands::SessionInfo::setSessionId (const Pointer< SessionId > & *sessionId*) [virtual]

6.611.2.11 virtual std::string activemq::commands::SessionInfo::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 655).

6.611.2.12 virtual Pointer<Command> activemq::commands::SessionInfo::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1067).

6.611.3 Field Documentation

6.611.3.1 const unsigned char activemq::commands::SessionInfo::ID_SESSIONINFO = 4 [static]

6.611.3.2 Pointer<SessionId> activemq::commands::SessionInfo::sessionId [protected]

  Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.612.1 Detailed Description

Marshaling code for Open Wire Format for **SessionInfoMarshaller** (p. 2881). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.612.2 Constructor & Destructor Documentation

6.612.2.1 activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::SessionInfoMarshalle () [inline]

6.612.2.2 virtual activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::~SessionInfoMarshall () [inline, virtual]

6.612.3 Member Function Documentation

6.612.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.612.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.612.3.3 virtual void activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 686).

6.612.3.4 virtual void activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 687).

6.612.3.5 virtual int activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 688).

6.612.3.6 virtual void activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 689).

6.612.3.7 virtual void activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 690).

The documentation for this class was generated from the following file:

6.613.3 Member Function Documentation

6.613.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.613.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.613.3.3 virtual void activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 665).

6.613.3.4 virtual void activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 666).

6.613.3.5 virtual int activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 667).

6.613.3.6 virtual void activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 668).

6.613.3.7 virtual void activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 669).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.614.3.3 virtual void activemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 672).

6.614.3.4 virtual void activemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 673).

6.614.3.5 virtual int activemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 674).

6.614.3.6 virtual void activemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 675).

6.614.3.7 virtual void activemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.615.3.3 virtual void activemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 679).

6.615.3.4 virtual void activemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 680).

6.615.3.5 virtual int activemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 681).

6.615.3.6 virtual void activemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 682).

6.615.3.7 virtual void activemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 683).

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.616.1 Detailed Description

Marshaling code for Open Wire Format for **SessionInfoMarshaller** (p. 2897). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.616.2 Constructor & Destructor Documentation

6.616.2.1 activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::SessionInfoMarshalle () [inline]

6.616.2.2 virtual activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::~SessionInfoMarshall () [inline, virtual]

6.616.3 Member Function Documentation

6.616.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.616.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.616.3.3 virtual void activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 658).

6.616.3.4 virtual void activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 659).

6.616.3.5 virtual int activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 660).

6.616.3.6 virtual void activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 661).

6.616.3.7 virtual void activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 662).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/**SessionInfoMarshaller.h**

6.617 activemq::cmsutil::SessionPool Class Reference

A pool of CMS sessions from the same connection and with the same acknowledge mode.

`#include <src/main/activemq/cmsutil/SessionPool.h>`

Public Member Functions

- **SessionPool** (**cms::Connection** *connection, **cms::Session::AcknowledgeMode** ackMode, **ResourceLifecycleManager** *resourceLifecycleManager)

  Constructs a session pool.

- virtual ~**SessionPool** ()

  Destroys the pooled session objects, but not the underlying session resources.

- virtual **PooledSession** * **takeSession** () throw (cms::CMSException)

  Takes a session from the pool, creating one if necessary.

- virtual void **returnSession** (**PooledSession** *session)

  Returns a session to the pool.

- **ResourceLifecycleManager** * **getResourceLifecycleManager** ()

6.617.1 Detailed Description

A pool of CMS sessions from the same connection and with the same acknowledge mode. Internal session resources are managed through a provided `ResourceLifecycleManager (p. 2778)`, not by this pool. This class is thread-safe.

6.617.2 Constructor & Destructor Documentation

6.617.2.1 activemq::cmsutil::SessionPool::SessionPool (cms::Connection * *connection*, cms::Session::AcknowledgeMode *ackMode*, ResourceLifecycleManager * *resourceLifecycleManager*)

Constructs a session pool.

Parameters:

connection the connection to be used for creating all sessions.

ackMode the acknowledge mode to be used for all sessions

resourceLifecycleManager the object responsible for managing the lifecycle of any allocated **cms::Session** (p. 2839) resources.

6.617.2.2 virtual activemq::cmsutil::SessionPool::~SessionPool () `[virtual]`

Destroys the pooled session objects, but not the underlying session resources. That is the job of the **ResourceLifecycleManager** (p. 2778).

6.617.3 Member Function Documentation

6.617.3.1 ResourceLifecycleManager* activemq::cmsutil::SessionPool::getResourceLifecycleManager () [inline]

6.617.3.2 virtual void activemq::cmsutil::SessionPool::returnSession (PooledSession * *session*) [virtual]

Returns a session to the pool.

Parameters:

session the session to be returned.

6.617.3.3 virtual PooledSession* activemq::cmsutil::SessionPool::takeSession () throw (cms::CMSException) [virtual]

Takes a session from the pool, creating one if necessary.

Returns:

the pooled session object

Exceptions:

cms::CMSException *(*p. *1031)* if an error occurred

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**SessionPool.h**

6.619 decaf::util::Set< E > Class Template Reference

A collection that contains no duplicate elements.

`#include <src/main/decaf/util/Set.h>`Inheritance diagram for decaf::util::Set< E >:

Public Member Functions

- virtual ~**Set** ()

6.619.1 Detailed Description

template<typename E> class decaf::util::Set< E >

A collection that contains no duplicate elements. More formally, sets contain no pair of elements e1 and e2 such that e1 == e2, and at most one null element. As implied by its name, this interface models the mathematical set abstraction.

The additional stipulation on constructors is, not surprisingly, that all constructors must create a set that contains no duplicate elements (as defined above).

Note: Great care must be exercised if mutable objects are used as set elements. The behavior of a set is not specified if the value of an object is changed in a manner that affects equals comparisons while the object is an element in the set.

Since:

1.0

6.620 decaf::lang::Short Class Reference

`#include <src/main/decaf/lang/Short.h>`Inheritance diagram for decaf::lang::Short:

Public Member Functions

- **Short** (short value)
- **Short** (const std::string &value) throw (exceptions::NumberFormatException)
- virtual ~**Short** ()
- virtual int **compareTo** (const **Short** &s) const

  *Compares this **Short** (p. 2906) instance with another.*

- bool **equals** (const **Short** &s) const
- virtual bool **operator==** (const **Short** &s) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const **Short** &s) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- virtual int **compareTo** (const short &s) const

  *Compares this **Short** (p. 2906) instance with another.*

- bool **equals** (const short &s) const
- virtual bool **operator==** (const short &s) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const short &s) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- std::string **toString** () const
- virtual double **doubleValue** () const

  Answers the double value which the receiver represents.

- virtual float **floatValue** () const

  Answers the float value which the receiver represents.

- virtual unsigned char **byteValue** () const

  Answers the byte value which the receiver represents.

- virtual short **shortValue** () const

  Answers the short value which the receiver represents.

- virtual int **intValue** () const

  Answers the int value which the receiver represents.

- virtual long long **longValue** () const

  Answers the long value which the receiver represents.

Static Public Member Functions

- static std::string **toString** (short value)
- static **Short decode** (const std::string &value) throw (exceptions::NumberFormatException)

  *Decodes a String into a **Short** (p. 2906).*

- static short **reverseBytes** (short value)

  Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified short value.

- static short **parseShort** (const std::string &s, int radix) throw (exceptions::NumberFormatException)

  Parses the string argument as a signed short in the radix specified by the second argument.

- static short **parseShort** (const std::string &s) throw (exceptions::NumberFormatException)

  Parses the string argument as a signed decimal short.

- static **Short valueOf** (short value)

  *Returns a **Short** (p. 2906) instance representing the specified short value.*

- static **Short valueOf** (const std::string &value) throw (exceptions::NumberFormatException)

  *Returns a **Short** (p. 2906) object holding the value given by the specified std::string.*

- static **Short valueOf** (const std::string &value, int radix) throw (exceptions::NumberFormatException)

  *Returns a **Short** (p. 2906) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*

Static Public Attributes

- static const int **SIZE** = 16

  Size of this objects primitive type in bits.

- static const short **MAX_VALUE** = (short)0x7FFF

  Max Value for this Object's primitive type.

- static const short **MIN_VALUE** = (short)0x8000

  Max Value for this Object's primitive type.

6.620.1 Constructor & Destructor Documentation

6.620.1.1 decaf::lang::Short::Short (short *value*)

Parameters:

value - short to wrap

6.620.1.2 decaf::lang::Short::Short (const std::string & *value*) throw (exceptions::NumberFormatException)

Parameters:

value - string value to convert to short and wrap

Exceptions:

NumberFormatException

6.620.1.3 virtual decaf::lang::Short::~Short () [inline, virtual]

6.620.2 Member Function Documentation

6.620.2.1 virtual unsigned char decaf::lang::Short::byteValue () const [inline, virtual]

Answers the byte value which the receiver represents.

Returns:

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2432).

6.620.2.2 virtual int decaf::lang::Short::compareTo (const short & *s*) const [virtual]

Compares this **Short** (p. 2906) instance with another.

Parameters:

s - the **Short** (p. 2906) instance to be compared

Returns:

zero if this object represents the same short value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object repesents a value less than the passed in value.

Implements **decaf::lang::Comparable< short >** (p. 1083).

6.620.2.3 virtual int decaf::lang::Short::compareTo (const Short & *s*) const [virtual]

Compares this **Short** (p. 2906) instance with another.

Parameters:

s - the **Short** (p. 2906) instance to be compared

Returns:

zero if this object represents the same short value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object repesents a value less than the passed in value.

Implements **decaf::lang::Comparable< Short >** (p. 1083).

6.620.2.4 static Short decaf::lang::Short::decode (const std::string & *value*) throw (exceptions::NumberFormatException) [static]

Decodes a String into a **Short** (p. 2906). Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the **Short.parseShort** (p. 2912) method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a NumberFormatException will be thrown. The result is negated if first character of the specified String is the minus sign. No whitespace characters are permitted in the string.

Parameters:

value - The string to decode

Returns:

a **Short** (p. 2906) object containing the decoded value

Exceptions:

NumberFomatException if the string is not formatted correctly.

6.620.2.5 virtual double decaf::lang::Short::doubleValue () const [inline, virtual]

Answers the double value which the receiver represents.

Returns:

double the value of the receiver.

Implements **decaf::lang::Number** (p. 2433).

6.620.2.6 bool decaf::lang::Short::equals (const short & *s*) const [inline, virtual]

Returns:

true if the two **Short** (p. 2906) Objects have the same value.

Implements **decaf::lang::Comparable< short >** (p. 1084).

6.620.2.7 bool decaf::lang::Short::equals (const Short & *s*) const [inline, virtual]

Returns:

true if the two **Short** (p. 2906) Objects have the same value.

Implements **decaf::lang::Comparable< Short >** (p. 1084).

6.620.2.8 virtual float decaf::lang::Short::floatValue () const [inline, virtual]

Answers the float value which the receiver represents.

Returns:

float the value of the receiver.

Implements **decaf::lang::Number** (p. 2433).

6.620.2.9 virtual int decaf::lang::Short::intValue () const [inline, virtual]

Answers the int value which the receiver represents.

Returns:

int the value of the receiver.

Implements **decaf::lang::Number** (p. 2433).

6.620.2.10 virtual long long decaf::lang::Short::longValue () const [inline, virtual]

Answers the long value which the receiver represents.

Returns:

long the value of the receiver.

Implements **decaf::lang::Number** (p. 2433).

6.620.2.11 virtual bool decaf::lang::Short::operator< (const short & *s*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

s - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< short >** (p. 1084).

6.620.2.12 virtual bool decaf::lang::Short::operator< (const Short & *s*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

s - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Short >** (p. 1084).

6.620.2.13 virtual bool decaf::lang::Short::operator== (const short & *s*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

s - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< short >** (p. 1085).

6.620.2.14 virtual bool decaf::lang::Short::operator== (const Short & *s*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

s - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Short >** (p. 1085).

6.620.2.15 static short decaf::lang::Short::parseShort (const std::string & *s*) throw (exceptions::NumberFormatException) [static]

Parses the string argument as a signed decimal short. The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting short value is returned, exactly as if the argument and the radix 10 were given as arguments to the parseShort(const std::string, int) method.

Parameters:

s - String to convert to a short

Returns:

the converted short value

Exceptions:

NumberFormatException if the string is not a short.

6.620.2.16 static short decaf::lang::Short::parseShort (const std::string & *s*, int *radix*) throw (exceptions::NumberFormatException) [static]

Parses the string argument as a signed short in the radix specified by the second argument. The characters in the string must all be digits, of the specified radix (as determined by whether **Character.digit(char, int)** (p. 985) returns a nonnegative value) except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting byte value is returned.

An exception of type NumberFormatException is thrown if any of the following situations occurs: * The first argument is null or is a string of length zero. * The radix is either smaller than **Character.MIN_RADIX** (p. 989) or larger than **Character.MAX_RADIX** (p. 989). * Any character of the string is not a digit of the specified radix, except that the first character may be a minus sign '-' provided that the string is longer than length 1. * The value represented by the string is not a value of type short.

Parameters:

s - the String containing the short representation to be parsed

radix - the radix to be used while parsing s

Returns:

the short represented by the string argument in the specified radix.

Exceptions:

NumberFormatException - If String does not contain a parsable short.

6.620.2.17 static short decaf::lang::Short::reverseBytes (short *value*) [static]

Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified short value.

Parameters:

value - the short whose bytes we are to reverse

Returns:

the reversed short.

6.620.2.18 virtual short decaf::lang::Short::shortValue () const [inline, virtual]

Answers the short value which the receiver represents.

Returns:

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2434).

6.620.2.19 static std::string decaf::lang::Short::toString (short *value*) [static]

Returns:

a string representing the primitive value as Base 10

6.620.2.20 std::string decaf::lang::Short::toString () const

Returns:

this **Short** (p. 2906) Object as a String Representation

6.620.2.21 static Short decaf::lang::Short::valueOf (const std::string & *value*, int *radix*) throw (exceptions::NumberFormatException) [static]

Returns a **Short** (p. 2906) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument. The first argument is interpreted as representing a signed short in the radix specified by the second argument, exactly as if the argument were given to the parseShort(std::string, int) method. The result is a **Short** (p. 2906) object that represents the short value specified by the string.

Parameters:

value - std::string to parse as base (radix)

radix - base of the string to parse.

Returns:

new **Short** (p. 2906) Object wrapping the primitive

Exceptions:

NumberFormatException if the string is not a valid short.

6.620.2.22 static Short decaf::lang::Short::valueOf (const std::string & *value*) throw (exceptions::NumberFormatException) [static]

Returns a **Short** (p. 2906) object holding the value given by the specified std::string. The argument is interpreted as representing a signed decimal short, exactly as if the argument were given to the parseShort(std::string) method. The result is a **Short** (p. 2906) object that represents the short value specified by the string.

Parameters:

value - std::string to parse as base 10

Returns:

new **Short** (p. 2906) Object wrapping the primitive

Exceptions:

NumberFormatException if the string is not a decimal short.

6.620.2.23 static Short decaf::lang::Short::valueOf (short *value*) [static]

Returns a **Short** (p. 2906) instance representing the specified short value.

Parameters:

value - the short to wrap

Returns:

the new **Short** (p. 2906) object wrapping value.

6.620.3 Field Documentation

6.620.3.1 const short decaf::lang::Short::MAX_VALUE = (short)0x7FFF [static]

Max Value for this Object's primitive type.

6.620.3.2 const short decaf::lang::Short::MIN_VALUE = (short)0x8000 [static]

Max Value for this Object's primitive type.

6.620.3.3 const int decaf::lang::Short::SIZE = 16 [static]

Size of this objects primitive type in bits.

The documentation for this class was generated from the following file:

6.621 decaf::internal::nio::ShortArrayBuffer Class Reference

`#include <src/main/decaf/internal/nio/ShortArrayBuffer.h>`Inheritance diagram for decaf::internal::nio::ShortArrayBuffer:

Public Member Functions

- **ShortArrayBuffer** (std::size_t capacity, bool readOnly=false)

  *Creates a **ShortArrayBuffer** (p. 2915) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

- **ShortArrayBuffer** (short *array, std::size_t offset, std::size_t capacity, bool readOnly=false) throw (decaf::lang::exceptions::NullPointerException)

  *Creates a **ShortArrayBuffer** (p. 2915) object that wraps the given array.*

- **ShortArrayBuffer** (**ByteArrayPerspective** &array, std::size_t offset, std::size_t capacity, bool readOnly=false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

  *Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 908) and start at the given offset.*

- **ShortArrayBuffer** (const **ShortArrayBuffer** &other)

  *Create a **ShortArrayBuffer** (p. 2915) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 908) and when changes are made to that data it is reflected in both.*

- virtual ~**ShortArrayBuffer** ()
- virtual short * **array** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)

  Returns the short array that backs this buffer (optional operation).

- virtual std::size_t **arrayOffset** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

- virtual ShortBuffer * **asReadOnlyBuffer** () const

  Creates a new, read-only short buffer that shares this buffer's content.

- virtual ShortBuffer & **compact** () throw (decaf::nio::ReadOnlyBufferException)

  Compacts this buffer.

- virtual ShortBuffer * **duplicate** ()

  Creates a new short buffer that shares this buffer's content.

- virtual short **get** () throw (decaf::nio::BufferUnderflowException)

  Relative get method.

- virtual short **get** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)

Absolute get method.

- virtual bool **hasArray** () const

  Tells whether or not this buffer is backed by an accessible short array.

- virtual bool **isReadOnly** () const

  Tells whether or not this buffer is read-only.

- virtual ShortBuffer & **put** (short value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

  Writes the given doubles into this buffer at the current position, and then increments the position.

- virtual ShortBuffer & **put** (std::size_t index, short value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)

  Writes the given doubles into this buffer at the given index.

- virtual ShortBuffer * **slice** () const

  Creates a new ShortBuffer whose content is a shared subsequence of this buffer's content.

Protected Member Functions

- virtual void **setReadOnly** (bool value)

  *Sets this **ByteArrayBuffer** (p. 870) as Read-Only.*

6.621.1 Constructor & Destructor Documentation

6.621.1.1 decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (std::size_t *capacity*, bool *readOnly* = `false`)

Creates a **ShortArrayBuffer** (p. 2915) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

6.621.1.2 decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (short * *array*, std::size_t *offset*, std::size_t *capacity*, bool *readOnly* = `false`) throw (decaf::lang::exceptions::NullPointerException)

Creates a **ShortArrayBuffer** (p. 2915) object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

offset - the position that is this buffers start pos.

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

Exceptions:

NullPointerException if buffer is NULL

6.621.1.3 decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (ByteArrayPerspective & *array*, std::size_t *offset*, std::size_t *capacity*, bool *readOnly* = `false`) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 908) and start at the given offset. The capacity and limit of the new **ShortArrayBuffer** (p. 2915) will be that of the remaining capacity of the passed buffer.

Parameters:

array - the **ByteArrayPerspective** (p. 908) to wrap

offset - the position that is this buffers start pos.

capacity - the length of the array we are wrapping or limit.

readOnly - is this a readOnly buffer.

Exceptions:

IndexOutOfBoundsException if offset is greater than array capacity.

6.621.1.4 decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (const ShortArrayBuffer & *other*)

Create a **ShortArrayBuffer** (p. 2915) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 908) and when changes are made to that data it is reflected in both.

Parameters:

other - the **ShortArrayBuffer** (p. 2915) this one is to mirror.

6.621.1.5 virtual decaf::internal::nio::ShortArrayBuffer::~ShortArrayBuffer () `[virtual]`

6.621.2 Member Function Documentation

6.621.2.1 virtual short* decaf::internal::nio::ShortArrayBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) `[virtual]`

Returns the short array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this Buffer

Exceptions:

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::ShortBuffer** (p. 2926).

6.621.2.2 virtual std::size_t decaf::internal::nio::ShortArrayBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::ShortBuffer** (p. 2926).

6.621.2.3 virtual ShortBuffer* decaf::internal::nio::ShortArrayBuffer::asReadOnlyBuffer () const [virtual]

Creates a new, read-only short buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only short buffer which the caller then owns.

Implements **decaf::nio::ShortBuffer** (p. 2926).

6.621.2.4 virtual ShortBuffer& decaf::internal::nio::ShortArrayBuffer::compact () throw (decaf::nio::ReadOnlyBufferException) [virtual]

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 807) is copied

to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 807) - 1 is copied to index n = **limit()** (p. 807) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this ShortBuffer

Exceptions:

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::ShortBuffer** (p. 2927).

6.621.2.5 virtual ShortBuffer* decaf::internal::nio::ShortArrayBuffer::duplicate () [virtual]

Creates a new short buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new short Buffer which the caller owns.

Implements **decaf::nio::ShortBuffer** (p. 2927).

6.621.2.6 virtual short decaf::internal::nio::ShortArrayBuffer::get (std::size_t *index*) const throw (lang::exceptions::IndexOutOfBoundsException) [virtual]

Absolute get method. Reads the value at the given index.

Parameters:

index - the index in the Buffer where the short is to be read

Returns:

the short that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implements **decaf::nio::ShortBuffer** (p. 2929).

6.621.2.7 virtual short decaf::internal::nio::ShortArrayBuffer::get () throw (decaf::nio::BufferUnderflowException) [virtual]

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the short at the current position

Exceptions:

BufferUnderflowException if there no more data to return

Implements **decaf::nio::ShortBuffer** (p. 2929).

6.621.2.8 virtual bool decaf::internal::nio::ShortArrayBuffer::hasArray () const [inline, virtual]

Tells whether or not this buffer is backed by an accessible short array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implements **decaf::nio::ShortBuffer** (p. 2929).

6.621.2.9 virtual bool decaf::internal::nio::ShortArrayBuffer::isReadOnly () const [inline, virtual]

Tells whether or not this buffer is read-only.

Returns:

true if, and only if, this buffer is read-only

Implements **decaf::nio::Buffer** (p. 806).

6.621.2.10 virtual ShortBuffer& decaf::internal::nio::ShortArrayBuffer::put (std::size_t *index*, short *value*) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException) [virtual]

Writes the given doubles into this buffer at the given index.

Parameters:

index - position in the Buffer to write the data

value - the doubles to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::ShortBuffer** (p. 2930).

6.621.2.11 virtual ShortBuffer& decaf::internal::nio::ShortArrayBuffer::put (short *value*) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException) [virtual]

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters:

value - the doubles value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::ShortBuffer** (p. 2930).

6.621.2.12 virtual void decaf::internal::nio::ShortArrayBuffer::setReadOnly (bool *value*) [inline, protected, virtual]

Sets this **ByteArrayBuffer** (p. 870) as Read-Only.

Parameters:

value - true if this buffer is to be read-only.

6.621.2.13 virtual ShortBuffer* decaf::internal::nio::ShortArrayBuffer::slice () const [virtual]

Creates a new ShortBuffer whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create ShortBuffer which the caller owns.

Implements **decaf::nio::ShortBuffer** (p. 2932).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/nio/**ShortArrayBuffer.h**

6.622 decaf::nio::ShortBuffer Class Reference

This class defines four categories of operations upon short buffers:.

`#include <src/main/decaf/nio/ShortBuffer.h>`Inheritance diagram for decaf::nio::ShortBuffer:

Public Member Functions

- virtual ~**ShortBuffer** ()
- virtual std::string **toString** () const
- virtual short * **array** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)

  Returns the short array that backs this buffer (optional operation).

- virtual std::size_t **arrayOffset** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

- virtual **ShortBuffer** * **asReadOnlyBuffer** () const =0

  Creates a new, read-only short buffer that shares this buffer's content.

- virtual **ShortBuffer** & **compact** ()=0 throw (ReadOnlyBufferException)

  Compacts this buffer.

- virtual **ShortBuffer** * **duplicate** ()=0

  Creates a new short buffer that shares this buffer's content.

- virtual short **get** ()=0 throw (BufferUnderflowException)

  Relative get method.

- virtual short **get** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)

  Absolute get method.

- **ShortBuffer** & **get** (std::vector< short > buffer) throw (BufferUnderflowException)

  Relative bulk get method.

- **ShortBuffer** & **get** (short *buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)

  Relative bulk get method.

- virtual bool **hasArray** () const =0

  Tells whether or not this buffer is backed by an accessible short array.

- **ShortBuffer** & **put** (**ShortBuffer** &src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)

  This method transfers the shorts remaining in the given source buffer into this buffer.

- **ShortBuffer** & **put** (const short *buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)

  This method transfers shorts into this buffer from the given source array.

- **ShortBuffer** & **put** (std::vector< short > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)

  This method transfers the entire content of the given source shorts array into this buffer.

- virtual **ShortBuffer** & **put** (short value)=0 throw (BufferOverflowException, ReadOnlyBufferException)

  Writes the given shorts into this buffer at the current position, and then increments the position.

- virtual **ShortBuffer** & **put** (std::size_t index, short value)=0 throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)

  Writes the given shorts into this buffer at the given index.

- virtual **ShortBuffer** * **slice** () const =0

  *Creates a new **ShortBuffer** (p. 2923) whose content is a shared subsequence of this buffer's content.*

- virtual int **compareTo** (const **ShortBuffer** &value) const

  Compares this object with the specified object for order.

- virtual bool **equals** (const **ShortBuffer** &value) const
- virtual bool **operator==** (const **ShortBuffer** &value) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const **ShortBuffer** &value) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

Static Public Member Functions

- static **ShortBuffer** * **allocate** (std::size_t capacity)

  Allocates a new Double buffer.

- static **ShortBuffer** * **wrap** (short *array, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)

  *Wraps the passed buffer with a new **ShortBuffer** (p. 2923).*

- static **ShortBuffer** * **wrap** (std::vector< short > &buffer)

  *Wraps the passed STL short Vector in a **ShortBuffer** (p. 2923).*

Protected Member Functions

- **ShortBuffer** (std::size_t capacity)

  *Creates a **ShortBuffer** (p. 2923) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.622.1 Detailed Description

This class defines four categories of operations upon short buffers:. o Absolute and relative get and put methods that read and write single shorts; o Relative bulk get methods that transfer contiguous sequences of shorts from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of shorts from a short array or some other short buffer into this buffer o Methods for compacting, duplicating, and slicing a short buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing short array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.622.2 Constructor & Destructor Documentation

6.622.2.1 decaf::nio::ShortBuffer::ShortBuffer (std::size_t *capacity*) [protected]

Creates a **ShortBuffer** (p. 2923) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size and limit of the **Buffer** (p. 803) in doubles

6.622.2.2 virtual decaf::nio::ShortBuffer::~ShortBuffer () [inline, virtual]

6.622.3 Member Function Documentation

6.622.3.1 static ShortBuffer* decaf::nio::ShortBuffer::allocate (std::size_t *capacity*) [static]

Allocates a new Double buffer. The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters:

capacity - The size of the Double buffer in shorts

Returns:

the **ShortBuffer** (p. 2923) that was allocated, caller owns.

6.622.3.2 virtual short* decaf::nio::ShortBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]

Returns the short array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this **Buffer** (p. 803)

Exceptions:

ReadOnlyBufferException *(p. 2685)* if this **Buffer** (p. 803) is read only.
UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2917).

6.622.3.3 virtual std::size_t decaf::nio::ShortBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException *(p. 2685)* if this **Buffer** (p. 803) is read only.
UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2918).

6.622.3.4 virtual ShortBuffer* decaf::nio::ShortBuffer::asReadOnlyBuffer () const [pure virtual]

Creates a new, read-only short buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only short buffer which the caller then owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2918).

6.622.3.5 virtual ShortBuffer& decaf::nio::ShortBuffer::compact () throw (ReadOnlyBufferException) [pure virtual]

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 807) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 807) - 1 is copied to index n = **limit()** (p. 807) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **ShortBuffer** (p. 2923)

Exceptions:

ReadOnlyBufferException *(p. **2685**)* - If this buffer is read-only

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2918).

6.622.3.6 virtual int decaf::nio::ShortBuffer::compareTo (const ShortBuffer & *value*) const [virtual]

Compares this object with the specified object for order. Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Parameters:

value - the Object to be compared.

Returns:

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

6.622.3.7 virtual ShortBuffer* decaf::nio::ShortBuffer::duplicate () [pure virtual]

Creates a new short buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new short **Buffer** (p. 803) which the caller owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2919).

6.622.3.8 virtual bool decaf::nio::ShortBuffer::equals (const ShortBuffer & *value*) const [virtual]

Returns:

true if this value is considered equal to the passed value.

6.622.3.9 ShortBuffer& decaf::nio::ShortBuffer::get (short * *buffer*, std::size_t *offset*, std::size_t *length*) throw (BufferUnderflowException, lang::exceptions::NullPointerException)

Relative bulk get method. This method transfers shorts from this buffer into the given destination array. If there are fewer shorts remaining in the buffer than are required to satisfy the request, that is, if length > **remaining()** (p. 808), then no bytes are transferred and a **BufferUnderflowException** (p. 837) is thrown.

Otherwise, this method copies length shorts from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters:

buffer - pointer to an allocated buffer to fill

offset - position in the buffer to start filling

length - amount of data to put in the passed buffer

Returns:

a reference to this **Buffer** (p. 803)

Exceptions:

BufferUnderflowException *(p. 837)* - If there are fewer than length shorts remaining in this buffer

NullPointerException if the passed buffer is null.

6.622.3.10 ShortBuffer& decaf::nio::ShortBuffer::get (std::vector< short > *buffer*) throw (BufferUnderflowException)

Relative bulk get method. This method transfers values from this buffer into the given destination vector. An invocation of this method of the form src.get(a) behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call buffer.resize(N) before calling this get method.

Returns:

a reference to this **Buffer** (p. 803)

Exceptions:

BufferUnderflowException *(p. 837)* - If there are fewer than length shorts remaining in this buffer

6.622.3.11 virtual short decaf::nio::ShortBuffer::get (std::size_t *index*) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Absolute get method. Reads the value at the given index.

Parameters:

index - the index in the **Buffer** (p. 803) where the short is to be read

Returns:

the short that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2919).

6.622.3.12 virtual short decaf::nio::ShortBuffer::get () throw (BufferUnderflowException) [pure virtual]

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the short at the current position

Exceptions:

BufferUnderflowException *(p. 837)* if there no more data to return

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2920).

6.622.3.13 virtual bool decaf::nio::ShortBuffer::hasArray () const [pure virtual]

Tells whether or not this buffer is backed by an accessible short array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2920).

6.622.3.14 virtual bool decaf::nio::ShortBuffer::operator< (const ShortBuffer & *value*) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.622.3.15 virtual bool decaf::nio::ShortBuffer::operator== (const ShortBuffer & *value*) const [virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.622.3.16 virtual ShortBuffer& decaf::nio::ShortBuffer::put (std::size_t *index*, short *value*) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException) [pure virtual]

Writes the given shorts into this buffer at the given index.

Parameters:

index - position in the **Buffer** (p. 803) to write the data

value - the shorts to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. ***2685***) - If this buffer is read-only

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2920).

6.622.3.17 virtual ShortBuffer& decaf::nio::ShortBuffer::put (short *value*) throw (BufferOverflowException, ReadOnlyBufferException) [pure virtual]

Writes the given shorts into this buffer at the current position, and then increments the position.

Parameters:

value - the shorts value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException *(p. 834)* - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException *(p. 2685)* - If this buffer is read-only

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2921).

6.622.3.18 ShortBuffer& decaf::nio::ShortBuffer::put (std::vector< short > & *buffer*) throw (BufferOverflowException, ReadOnlyBufferException)

This method transfers the entire content of the given source shorts array into this buffer. This is the same as calling put(&buffer[0], 0, buffer.size()

Parameters:

buffer - The buffer whose contents are copied to this **ShortBuffer** (p. 2923)

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException *(p. 834)* - If there is insufficient space in this buffer

ReadOnlyBufferException *(p. 2685)* - If this buffer is read-only

6.622.3.19 ShortBuffer& decaf::nio::ShortBuffer::put (const short * *buffer*, std::size_t *offset*, std::size_t *length*) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)

This method transfers shorts into this buffer from the given source array. If there are more shorts to be copied from the array than remain in this buffer, that is, if length > **remaining()** (p. 808), then no shorts are transferred and a **BufferOverflowException** (p. 834) is thrown.

Otherwise, this method copies length bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by length.

Parameters:

buffer- The array from which shorts are to be read

offset- The offset within the array of the first short to be read;

length - The number of shorts to be read from the given array

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException *(p. 834)* - If there is insufficient space in this buffer

ReadOnlyBufferException *(p. 2685)* - If this buffer is read-only

NullPointerException if the passed buffer is null.

6.622.3.20 ShortBuffer& decaf::nio::ShortBuffer::put (ShortBuffer & *src*) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)

This method transfers the shorts remaining in the given source buffer into this buffer. If there are more shorts remaining in the source buffer than in this buffer, that is, if src.remaining() > **remaining()** (p. 808), then no shorts are transferred and a **BufferOverflowException** (p. 834) is thrown.

Otherwise, this method copies n = src.remaining() shorts from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by n.

Parameters:

src - the buffer to take shorts from an place in this one.

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException *(p. 834)* - If there is insufficient space in this buffer for the remaining shorts in the source buffer

IllegalArgumentException - If the source buffer is this buffer

ReadOnlyBufferException *(p. 2685)* - If this buffer is read-only

6.622.3.21 virtual ShortBuffer* decaf::nio::ShortBuffer::slice () const [pure virtual]

Creates a new **ShortBuffer** (p. 2923) whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **ShortBuffer** (p. 2923) which the caller owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2921).

6.622.3.22 virtual std::string decaf::nio::ShortBuffer::toString () const [virtual]

Returns:

a std::string describing this object

6.622.3.23 static ShortBuffer* decaf::nio::ShortBuffer::wrap (std::vector< short > & *buffer*) [static]

Wraps the passed STL short Vector in a **ShortBuffer** (p. 2923). The new buffer will be backed by the given short array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns:

a new **ShortBuffer** (p. 2923) that is backed by buffer, caller owns.

6.622.3.24 static ShortBuffer* decaf::nio::ShortBuffer::wrap (short * *array*, std::size_t *offset*, std::size_t *length*) throw (lang::exceptions::NullPointerException) [static]

Wraps the passed buffer with a new **ShortBuffer** (p. 2923). The new buffer will be backed by the given short array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

array - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns:

a new **ShortBuffer** (p. 2923) that is backed by buffer, caller owns.

The documentation for this class was generated from the following file:

- src/main/decaf/nio/**ShortBuffer.h**

6.623 activemq::commands::ShutdownInfo Class Reference

`#include <src/main/activemq/commands/ShutdownInfo.h>`Inheritance diagram for activemq::commands::ShutdownInfo:

Public Member Functions

- **ShutdownInfo** ()
- virtual ~**ShutdownInfo** ()
- virtual unsigned char **getDataStructureType** () const

  Get the unique identifier that this object and its own Marshaler share.

- virtual **ShutdownInfo** * **cloneDataStructure** () const

  Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

  Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure*** (p. *1461) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure*** (p. *1461) passed in to this one, and returns if they are equivalent.*

- virtual bool **isShutdownInfo** () const
- virtual **Pointer**< **Command** > **visit** (**activemq::state::CommandVisitor** *visitor) throw (exceptions::ActiveMQException)

  Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_SHUTDOWNINFO** = 11

Protected Member Functions

- **ShutdownInfo** (const **ShutdownInfo** &)
- **ShutdownInfo** & **operator**= (const **ShutdownInfo** &)

6.623.1 Constructor & Destructor Documentation

6.623.1.1 activemq::commands::ShutdownInfo::ShutdownInfo (const ShutdownInfo &) [inline, protected]

6.623.1.2 activemq::commands::ShutdownInfo::ShutdownInfo ()

6.623.1.3 virtual activemq::commands::ShutdownInfo::~ShutdownInfo () [virtual]

6.623.2 Member Function Documentation

6.623.2.1 virtual ShutdownInfo* activemq::commands::ShutdownInfo::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.623.2.2 virtual void activemq::commands::ShutdownInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.623.2.3 virtual bool activemq::commands::ShutdownInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.623.2.4 virtual unsigned char activemq::commands::ShutdownInfo::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.623.2.5 virtual bool activemq::commands::ShutdownInfo::isShutdownInfo () const [inline, virtual]

Returns:

an answer of true to the **isShutdownInfo()** (p. 2936) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 655).

6.623.2.6 ShutdownInfo& activemq::commands::ShutdownInfo::operator= (const ShutdownInfo &) [inline, protected]

6.623.2.7 virtual std::string activemq::commands::ShutdownInfo::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 655).

6.623.2.8 virtual Pointer<Command> activemq::commands::ShutdownInfo::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1067).

6.623.3 Field Documentation

6.623.3.1 const unsigned char activemq::commands::ShutdownInfo::ID_SHUTDOWNINFO = 11 [static]

The documentation for this class was generated from the following file:

Public Member Functions

- **ShutdownInfoMarshaller** ()
- virtual ~**ShutdownInfoMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.624.1 Detailed Description

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 2937). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.624.2 Constructor & Destructor Documentation

6.624.2.1 activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::ShutdownInfoMars () [inline]

6.624.2.2 virtual activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::~ShutdownInfoMa () [inline, virtual]

6.624.3 Member Function Documentation

6.624.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.624.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::getDataStructureTy () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.624.3.3 virtual void activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 665).

6.624.3.4 virtual void activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 666).

6.624.3.5 virtual int activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 667).

6.624.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 668).

6.624.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 669).

6.625.3 Member Function Documentation

6.625.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.625.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::getDataStructureTy () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.625.3.3 virtual void activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 672).

6.625.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 673).

6.625.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 674).

6.625.3.6 virtual void activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 675).

6.625.3.7 virtual void activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 676).

6.626.3 Member Function Documentation

6.626.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.626.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::getDataStructureTy () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.626.3.3 virtual void activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 658).

6.626.3.4 virtual void activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 659).

6.626.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 660).

6.626.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 661).

6.626.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 662).

The documentation for this class was generated from the following file:

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.627.1 Detailed Description

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 2949). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.627.2 Constructor & Destructor Documentation

6.627.2.1 activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::ShutdownInfoMars () [inline]

6.627.2.2 virtual activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::~ShutdownInfoMa () [inline, virtual]

6.627.3 Member Function Documentation

6.627.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.627.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::getDataStructureTy () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.627.3.3 virtual void activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 686).

6.627.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 687).

6.627.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 688).

6.627.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 689).

6.627.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 690).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/**ShutdownInfoMarshaller.h**

6.628 activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarsh Class Reference

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 2953).

`#include <src/main/activemq/wireformat/openwire/marshal/v5/ShutdownInfoMarshaller.h>`Inheritance diagram for activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller:

Public Member Functions

- **ShutdownInfoMarshaller** ()
- virtual ~**ShutdownInfoMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.628.1 Detailed Description

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 2953). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.628.2 Constructor & Destructor Documentation

6.628.2.1 activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::ShutdownInfoMars () [inline]

6.628.2.2 virtual activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::~ShutdownInfoMa () [inline, virtual]

6.628.3 Member Function Documentation

6.628.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.628.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::getDataStructureTy () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.628.3.3 virtual void activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 679).

6.628.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 680).

6.628.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 681).

6.628.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 682).

6.628.3.7 virtual void activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 683).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v5/**ShutdownInfoMarshaller.h**

6.629 decaf::security::SignatureException Class Reference

`#include <src/main/decaf/security/SignatureException.h>`Inheritance diagram for decaf::security::SignatureException:

Public Member Functions

- **SignatureException** () throw ()
  Default Constructor.
- **SignatureException** (const Exception &ex) throw ()
  Conversion Constructor from some other Exception.
- **SignatureException** (const **SignatureException** &ex) throw ()
  Copy Constructor.
- **SignatureException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- **SignatureException** (const std::exception *cause) throw ()
  Constructor.
- **SignatureException** (const char *file, const int lineNumber, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **SignatureException** * **clone** () const
  Clones this exception.
- virtual ~**SignatureException** () throw ()

6.629.1 Constructor & Destructor Documentation

6.629.1.1 decaf::security::SignatureException::SignatureException () throw () [inline]

Default Constructor.

6.629.1.2 decaf::security::SignatureException::SignatureException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.629.1.3 decaf::security::SignatureException::SignatureException (const SignatureException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.629.1.4 decaf::security::SignatureException::SignatureException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.629.1.5 decaf::security::SignatureException::SignatureException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.629.1.6 decaf::security::SignatureException::SignatureException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.629.1.7 virtual decaf::security::SignatureException::~SignatureException () throw () [inline, virtual]

6.629.2 Member Function Documentation

6.629.2.1 virtual SignatureException* decaf::security::SignatureException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented from **decaf::security::GeneralSecurityException** (p. 1708).

The documentation for this class was generated from the following file:

- src/main/decaf/security/**SignatureException.h**

6.630 decaf::util::logging::SimpleFormatter Class Reference

Print a brief summary of the **LogRecord** (p. 2050) in a human readable format.

`#include <src/main/decaf/util/logging/SimpleFormatter.h>`Inheritance diagram for decaf::util::logging::SimpleFormatter:

Public Member Functions

- **SimpleFormatter** ()
- virtual ~**SimpleFormatter** ()
- virtual std::string **format** (const **LogRecord** &record) const

  Format the given log record and return the formatted string.

- virtual std::string **formatMessage** (const **LogRecord** &record) const

  Format the message string from a log record.

- virtual std::string **getHead** (const **Handler** *handler)

  Return the header string for a set of formatted records.

- virtual std::string **getTail** (const **Handler** *handler)

  Return the tail string for a set of formatted records.

6.630.1 Detailed Description

Print a brief summary of the **LogRecord** (p. 2050) in a human readable format. The summary will typically be 1 or 2 lines.

6.630.2 Constructor & Destructor Documentation

6.630.2.1 decaf::util::logging::SimpleFormatter::SimpleFormatter () [inline]

6.630.2.2 virtual decaf::util::logging::SimpleFormatter::~SimpleFormatter () [inline, virtual]

6.630.3 Member Function Documentation

6.630.3.1 virtual std::string decaf::util::logging::SimpleFormatter::format (const LogRecord & *record*) const [inline, virtual]

Format the given log record and return the formatted string.

Parameters:

record The Log Record to Format

Implements **decaf::util::logging::Formatter** (p. 1699).

6.630.3.2 virtual std::string decaf::util::logging::SimpleFormatter::formatMessage (const LogRecord & *record*) const [inline, virtual]

Format the message string from a log record.

Parameters:

record The Log Record to Format

Implements **decaf::util::logging::Formatter** (p. 1700).

References decaf::util::logging::LogRecord::getMessage().

6.630.3.3 virtual std::string decaf::util::logging::SimpleFormatter::getHead (const Handler * *handler*) [inline, virtual]

Return the header string for a set of formatted records. In the default implementation this method should return empty string

Parameters:

handler the target handler, can be null

Returns:

empty string

Implements **decaf::util::logging::Formatter** (p. 1700).

6.630.3.4 virtual std::string decaf::util::logging::SimpleFormatter::getTail (const Handler * *handler*) [inline, virtual]

Return the tail string for a set of formatted records. In the default implementation this method should return empty string

Parameters:

handler the target handler, can be null

Returns:

empty string

Implements **decaf::util::logging::Formatter** (p. 1700).

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**SimpleFormatter.h**

6.631 decaf::util::logging::SimpleLogger Class Reference

`#include <src/main/decaf/util/logging/SimpleLogger.h>`

Public Member Functions

- **SimpleLogger** (const std::string &name)

  Constructor.

- virtual ~**SimpleLogger** ()

  Destructor.

- virtual void **mark** (const std::string &message)

  Log a Mark Block Level Log.

- virtual void **debug** (const std::string &file, const int line, const std::string &message)

  Log a Debug Level Log.

- virtual void **info** (const std::string &file, const int line, const std::string &message)

  Log a Informational Level Log.

- virtual void **warn** (const std::string &file, const int line, const std::string &message)

  Log a Warning Level Log.

- virtual void **error** (const std::string &file, const int line, const std::string &message)

  Log a Error Level Log.

- virtual void **fatal** (const std::string &file, const int line, const std::string &message)

  Log a Fatal Level Log.

- virtual void **log** (const std::string &message)

  No-frills log.

6.631.1 Constructor & Destructor Documentation

6.631.1.1 decaf::util::logging::SimpleLogger::SimpleLogger (const std::string & *name*)

Constructor.

6.631.1.2 virtual decaf::util::logging::SimpleLogger::~SimpleLogger () [virtual]

Destructor.

6.631.2 Member Function Documentation

6.631.2.1 virtual void decaf::util::logging::SimpleLogger::debug (const std::string & *file*, const int *line*, const std::string & *message*) [virtual]

Log a Debug Level Log.

6.631.2.2 virtual void decaf::util::logging::SimpleLogger::error (const std::string & *file*, const int *line*, const std::string & *message*) [virtual]

Log a Error Level Log.

6.631.2.3 virtual void decaf::util::logging::SimpleLogger::fatal (const std::string & *file*, const int *line*, const std::string & *message*) [virtual]

Log a Fatal Level Log.

6.631.2.4 virtual void decaf::util::logging::SimpleLogger::info (const std::string & *file*, const int *line*, const std::string & *message*) [virtual]

Log a Informational Level Log.

6.631.2.5 virtual void decaf::util::logging::SimpleLogger::log (const std::string & *message*) [virtual]

No-frills log.

6.631.2.6 virtual void decaf::util::logging::SimpleLogger::mark (const std::string & *message*) [virtual]

Log a Mark Block Level Log.

6.631.2.7 virtual void decaf::util::logging::SimpleLogger::warn (const std::string & *file*, const int *line*, const std::string & *message*) [virtual]

Log a Warning Level Log.

6.632 decaf::net::Socket Class Reference

`#include <src/main/decaf/net/Socket.h>`Inheritance diagram for decaf::net::Socket:

Public Types

- typedef apr_socket_t * **SocketHandle**
  Define the SocketHandle type.
- typedef apr_sockaddr_t * **SocketAddress**
  Define the SocketAddress type.

Public Member Functions

- virtual ~**Socket** ()
- virtual void **connect** (const char *host, int port)=0 throw (SocketException)
  Connects to the specified destination.
- virtual bool **isConnected** () const =0
  Indicates whether or not this socket is connected to a destination.
- virtual **io::InputStream** * **getInputStream** ()=0
  Gets the InputStream for this socket.
- virtual **io::OutputStream** * **getOutputStream** ()=0
  Gets the OutputStream for this socket.
- virtual int **getSoLinger** () const =0 throw (SocketException)
  Gets the linger time.
- virtual void **setSoLinger** (int linger)=0 throw (SocketException)
  Sets the linger time.
- virtual bool **getKeepAlive** () const =0 throw (SocketException)
  Gets the keep alive flag.
- virtual void **setKeepAlive** (bool keepAlive)=0 throw (SocketException)
  Enables/disables the keep alive flag.
- virtual int **getReceiveBufferSize** () const =0 throw (SocketException)
  Gets the receive buffer size.
- virtual void **setReceiveBufferSize** (int size)=0 throw (SocketException)
  Sets the receive buffer size.
- virtual bool **getReuseAddress** () const =0 throw (SocketException)

Gets the reuse address flag.

- virtual void **setReuseAddress** (bool reuse)=0 throw (SocketException)
  Sets the reuse address flag.
- virtual int **getSendBufferSize** () const =0 throw (SocketException)
  Gets the send buffer size.
- virtual void **setSendBufferSize** (int size)=0 throw (SocketException)
  Sets the send buffer size.
- virtual int **getSoTimeout** () const =0 throw (SocketException)
  Gets the timeout for socket operations.
- virtual void **setSoTimeout** (int timeout)=0 throw (SocketException)
  Sets the timeout for socket operations.

6.632.1 Member Typedef Documentation

6.632.1.1 typedef apr_sockaddr_t* decaf::net::Socket::SocketAddress

Define the SocketAddress type.

6.632.1.2 typedef apr_socket_t* decaf::net::Socket::SocketHandle

Define the SocketHandle type.

6.632.2 Constructor & Destructor Documentation

6.632.2.1 virtual decaf::net::Socket::~Socket () [inline, virtual]

6.632.3 Member Function Documentation

6.632.3.1 virtual void decaf::net::Socket::connect (const char * *host*, int *port*) throw (SocketException) [pure virtual]

Connects to the specified destination. Closes this socket if connected to another destination.

Parameters:

host The host of the server to connect to.

port The port of the server to connect to.

Exceptions:

IOException Thrown if a failure occurred in the connect.

Implemented in **decaf::net::BufferedSocket** (p. 819), and **decaf::net::TcpSocket** (p. 3154).

6.632.3.2 virtual io::InputStream* decaf::net::Socket::getInputStream () [pure virtual]

Gets the InputStream for this socket.

Returns:

The InputStream for this socket. NULL if not connected.

Implemented in **decaf::net::BufferedSocket** (p. 819), and **decaf::net::TcpSocket** (p. 3155).

6.632.3.3 virtual bool decaf::net::Socket::getKeepAlive () const throw (SocketException) [pure virtual]

Gets the keep alive flag.

Returns:

True if keep alive is enabled.

Exceptions:

SocketException *(*p. ***2972)*** if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 819), and **decaf::net::TcpSocket** (p. 3155).

Referenced by decaf::net::BufferedSocket::getKeepAlive().

6.632.3.4 virtual io::OutputStream* decaf::net::Socket::getOutputStream () [pure virtual]

Gets the OutputStream for this socket.

Returns:

the OutputStream for this socket. NULL if not connected.

Implemented in **decaf::net::BufferedSocket** (p. 819), and **decaf::net::TcpSocket** (p. 3155).

6.632.3.5 virtual int decaf::net::Socket::getReceiveBufferSize () const throw (SocketException) [pure virtual]

Gets the receive buffer size.

Returns:

the receive buffer size in bytes.

Exceptions:

SocketException *(*p. ***2972)*** if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 820), and **decaf::net::TcpSocket** (p. 3155).

Referenced by decaf::net::BufferedSocket::getReceiveBufferSize().

6.632.3.6 virtual bool decaf::net::Socket::getReuseAddress () const throw (SocketException) [pure virtual]

Gets the reuse address flag.

Returns:

True if the address can be reused.

Exceptions:

SocketException *(*p. *2972)* if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 820), and **decaf::net::TcpSocket** (p. 3156).

Referenced by decaf::net::BufferedSocket::getReuseAddress().

6.632.3.7 virtual int decaf::net::Socket::getSendBufferSize () const throw (SocketException) [pure virtual]

Gets the send buffer size.

Returns:

the size in bytes of the send buffer.

Exceptions:

SocketException *(*p. *2972)* if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 820), and **decaf::net::TcpSocket** (p. 3156).

Referenced by decaf::net::BufferedSocket::getSendBufferSize().

6.632.3.8 virtual int decaf::net::Socket::getSoLinger () const throw (SocketException) [pure virtual]

Gets the linger time.

Returns:

The linger time in seconds.

Exceptions:

SocketException *(*p. *2972)* if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 820), and **decaf::net::TcpSocket** (p. 3156).

Referenced by decaf::net::BufferedSocket::getSoLinger().

6.632.3.9 virtual int decaf::net::Socket::getSoTimeout () const throw (SocketException) [pure virtual]

Gets the timeout for socket operations.

Returns:

The timeout in milliseconds for socket operations.

Exceptions:

SocketException *(*p. *2972)* Thrown if unable to retrieve the information.

Implemented in **decaf::net::BufferedSocket** (p. 821), and **decaf::net::TcpSocket** (p. 3157).

Referenced by decaf::net::BufferedSocket::getSoTimeout().

6.632.3.10 virtual bool decaf::net::Socket::isConnected () const [pure virtual]

Indicates whether or not this socket is connected to a destination.

Returns:

true if connected

Implemented in **decaf::net::BufferedSocket** (p. 821), and **decaf::net::TcpSocket** (p. 3157).

Referenced by decaf::net::BufferedSocket::isConnected().

6.632.3.11 virtual void decaf::net::Socket::setKeepAlive (bool *keepAlive*) throw (SocketException) [pure virtual]

Enables/disables the keep alive flag.

Parameters:

keepAlive If true, enables the flag.

Exceptions:

SocketException *(*p. *2972)* if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 821), and **decaf::net::TcpSocket** (p. 3157).

Referenced by decaf::net::BufferedSocket::setKeepAlive().

6.632.3.12 virtual void decaf::net::Socket::setReceiveBufferSize (int *size*) throw (SocketException) [pure virtual]

Sets the receive buffer size.

Parameters:

size Number of bytes to set the receive buffer to.

Exceptions:

SocketException *(*p. *2972)* if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 822), and **decaf::net::TcpSocket** (p. 3158).

Referenced by decaf::net::BufferedSocket::setReceiveBufferSize().

6.632.3.13 virtual void decaf::net::Socket::setReuseAddress (bool *reuse*) throw (SocketException) [pure virtual]

Sets the reuse address flag.

Parameters:

reuse If true, sets the flag.

Exceptions:

SocketException *(p. 2972)* if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 822), and **decaf::net::TcpSocket** (p. 3158).

Referenced by decaf::net::BufferedSocket::setReuseAddress().

6.632.3.14 virtual void decaf::net::Socket::setSendBufferSize (int *size*) throw (SocketException) [pure virtual]

Sets the send buffer size.

Parameters:

size The number of bytes to set the send buffer to.

Exceptions:

SocketException *(p. 2972)* if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 822), and **decaf::net::TcpSocket** (p. 3158).

Referenced by decaf::net::BufferedSocket::setSendBufferSize().

6.632.3.15 virtual void decaf::net::Socket::setSoLinger (int *linger*) throw (SocketException) [pure virtual]

Sets the linger time.

Parameters:

linger The linger time in seconds. If 0, linger is off.

Exceptions:

SocketException *(p. 2972)* if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 822), and **decaf::net::TcpSocket** (p. 3158).

Referenced by decaf::net::BufferedSocket::setSoLinger().

6.632.3.16 virtual void decaf::net::Socket::setSoTimeout (int *timeout*) throw (SocketException) [pure virtual]

Sets the timeout for socket operations.

Parameters:

timeout The timeout in milliseconds for socket operations.

Exceptions:

SocketException *(*p. *2972)* Thrown if unable to set the information.

Implemented in **decaf::net::BufferedSocket** (p. 823), and **decaf::net::TcpSocket** (p. 3159).

Referenced by decaf::net::BufferedSocket::setSoTimeout().

The documentation for this class was generated from the following file:

- src/main/decaf/net/**Socket.h**

6.633 decaf::net::SocketError Class Reference

Static utility class to simplify handling of error codes for socket operations.

`#include <src/main/decaf/net/SocketError.h>`

Static Public Member Functions

- static int **getErrorCode** ()
  Gets the last error appropriate for the platform.
- static std::string **getErrorString** ()
  Gets the string description for the last error.

6.633.1 Detailed Description

Static utility class to simplify handling of error codes for socket operations.

6.633.2 Member Function Documentation

6.633.2.1 static int decaf::net::SocketError::getErrorCode () [static]

Gets the last error appropriate for the platform.

6.633.2.2 static std::string decaf::net::SocketError::getErrorString () [static]

Gets the string description for the last error.

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketError.h**

6.634 decaf::net::SocketException Class Reference

Exception for errors when manipulating sockets.

`#include <src/main/decaf/net/SocketException.h>`Inheritance diagram for decaf::net::SocketException:

Public Member Functions

- **SocketException** () throw ()
- **SocketException** (const **lang::Exception** &ex) throw ()
- **SocketException** (const **SocketException** &ex) throw ()
- **SocketException** (const char *file, const int lineNumber, const std::exception ***cause**, const char *msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.

- **SocketException** (const std::exception ***cause**) throw ()

  Constructor.

- **SocketException** (const char *file, const int lineNumber, const char *msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **SocketException** * **clone** () const

  Clones this exception.

- virtual ~**SocketException** () throw ()

6.634.1 Detailed Description

Exception for errors when manipulating sockets.

6.634.2 Constructor & Destructor Documentation

6.634.2.1 decaf::net::SocketException::SocketException () throw () [inline]

6.634.2.2 decaf::net::SocketException::SocketException (const lang::Exception & *ex*) throw () [inline]

6.634.2.3 decaf::net::SocketException::SocketException (const SocketException & *ex*) throw () [inline]

6.634.2.4 decaf::net::SocketException::SocketException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.634.2.5 decaf::net::SocketException::SocketException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.634.2.6 decaf::net::SocketException::SocketException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.634.2.7 virtual decaf::net::SocketException::~SocketException () throw () [inline, virtual]

6.634.3 Member Function Documentation

6.634.3.1 virtual SocketException* decaf::net::SocketException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1822).

Reimplemented in **decaf::net::BindException** (p. 723), **decaf::net::ConnectException** (p. 1130), **decaf::net::NoRouteToHostException** (p. 2419), and **decaf::net::PortUnreachableException** (p. 2524).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketException.h**

6.635 decaf::net::SocketFactory Class Reference

Socket (p. 2964) Factory implementation for use in Creating Sockets.

`#include <src/main/decaf/net/SocketFactory.h>`

Public Member Functions

- virtual ~**SocketFactory** ()

Static Public Member Functions

- static **Socket** * **createSocket** (const std::string &uri, const **util::Properties** &properties) throw (SocketException)

  *Creates and returns a **Socket** (p. 2964) derived Object based on the values defined in the Properties Object that is passed in.*

6.635.1 Detailed Description

Socket (p. 2964) Factory implementation for use in Creating Sockets. Property Options:

Name Value

---

inputBufferSize size in bytes of the buffered input stream buffer. Defaults to 10000.

outputBufferSize size in bytes of the buffered output stream buffer. Defaults to 10000.

soLinger linger time for the socket (in microseconds). Defaults to 0.

soKeepAlive keep alive flag for the socket (true/false). Defaults to false.

soReceiveBufferSize The size of the socket receive buffer (in bytes). Defaults to 2MB.

soSendBufferSize The size of the socket send buffer (in bytes). Defaults to 2MB.

soTimeout The timeout of socket IO operations (in microseconds). Defaults to 10000

`Socket (p. 2964)`

6.635.2 Constructor & Destructor Documentation

6.635.2.1 virtual decaf::net::SocketFactory::~SocketFactory () `[inline, virtual]`

6.635.3 Member Function Documentation

6.635.3.1 static Socket* decaf::net::SocketFactory::createSocket (const std::string & *uri*, const util::Properties & *properties*) throw (SocketException) `[static]`

Creates and returns a **Socket** (p. 2964) derived Object based on the values defined in the Properties Object that is passed in.

Parameters:

uri the **URI** (p. 3308) for the **Socket** (p. 2964) Connection.

properties A Properties object that contains configuration details.

Exceptions:

SocketException.

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketFactory.h**

6.636 decaf::net::SocketInputStream Class Reference

Input stream for performing reads on a socket.

`#include <src/main/decaf/net/SocketInputStream.h>`Inheritance diagram for decaf::net::SocketInputStream:

Public Member Functions

- **SocketInputStream** (**Socket::SocketHandle** socket)

  Constructor.

- virtual ~**SocketInputStream** ()

  Destructor.

- virtual std::size_t **available** () const throw (io::IOException)

  Returns the number of bytes available on the socket to be read right now.

- virtual int **read** () throw (io::IOException)

  Reads a single byte from the buffer.

- virtual int **read** (unsigned char *buffer, std::size_t offset, std::size_t bufferSize) throw (io::IOException, lang::exceptions::NullPointerException)

  Reads an array of bytes from the buffer.

- virtual void **close** () throw (decaf::io::IOException)

  Close - does nothing.

- virtual std::size_t **skip** (std::size_t num) throw (io::IOException, lang::exceptions::UnsupportedOperationException)

  Not supported.

- virtual void **mark** (int readLimit DECAF_UNUSED)

  Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

- virtual void **reset** () throw (io::IOException)

  Repositions this stream to the position at the time the mark method was last called on this input stream.

- virtual bool **markSupported** () const

  Determines if this input stream supports the mark and reset methods.

- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)

  Locks the object.

- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)

  Unlocks the object.

- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals the waiters on this object that it can now wake up and continue.

6.636.1 Detailed Description

Input stream for performing reads on a socket. This class will only work properly for blocking sockets.

6.636.2 Constructor & Destructor Documentation

6.636.2.1 decaf::net::SocketInputStream::SocketInputStream (Socket::SocketHandle *socket*)

Constructor.

Parameters:

socket the socket handle.

6.636.2.2 virtual decaf::net::SocketInputStream::~SocketInputStream () [virtual]

Destructor.

6.636.3 Member Function Documentation

6.636.3.1 virtual std::size_t decaf::net::SocketInputStream::available () const throw (io::IOException) [virtual]

Returns the number of bytes available on the socket to be read right now.

Returns:

The number of bytes currently available to be read on the socket.

Implements **decaf::io::InputStream** (p. 1741).

6.636.3.2 virtual void decaf::net::SocketInputStream::close () throw (decaf::io::IOException) [virtual]

Close - does nothing. It is the responsibility of the owner of the socket object to close it.

Exceptions:

IOException

Implements **decaf::io::Closeable** (p. 1019).

6.636.3.3 virtual void decaf::net::SocketInputStream::lock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3123).

6.636.3.4 virtual void decaf::net::SocketInputStream::mark (int readLimit ***DECAF_UNUSED***) [inline, virtual]

Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes. If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Parameters:

readLimit - max bytes read before marked position is invalid.

Implements **decaf::io::InputStream** (p. 1741).

6.636.3.5 virtual bool decaf::net::SocketInputStream::markSupported () const [inline, virtual]

Determines if this input stream supports the mark and reset methods. Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

Returns:

true if this stream instance supports marks

Implements **decaf::io::InputStream** (p. 1741).

6.636.3.6 virtual void decaf::net::SocketInputStream::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3124).

6.636.3.7 virtual void decaf::net::SocketInputStream::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3125).

6.636.3.8 virtual int decaf::net::SocketInputStream::read (unsigned char * *buffer*, std::size_t *offset*, std::size_t *bufferSize*) throw (io::IOException, lang::exceptions::NullPointerException) [virtual]

Reads an array of bytes from the buffer. If the desired amount of data is not currently available, this operation will block until the appropriate amount of data is available.

Parameters:

buffer (out) the target buffer

offset the position in the buffer to start from.

bufferSize the size of the output buffer.

Returns:

the number of bytes read. or -1 if EOF

Exceptions:

IOException f an error occurs.

Implements **decaf::io::InputStream** (p. 1742).

6.636.3.9 virtual int decaf::net::SocketInputStream::read () throw (io::IOException) [virtual]

Reads a single byte from the buffer. If no data is available, blocks until their is.

Returns:

The next byte.

Exceptions:

IOException thrown if an error occurs.

Implements **decaf::io::InputStream** (p. 1742).

6.636.3.10 virtual void decaf::net::SocketInputStream::reset () throw (io::IOException) [inline, virtual]

Repositions this stream to the position at the time the mark method was last called on this input stream. If the method markSupported returns true, then: ∗ If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an IOException might be thrown. ∗ If such an IOException is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset. If the method markSupported returns false, then: ∗ The call to reset may throw an IOException. ∗ If an IOException is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

Exceptions:

IOException

Implements **decaf::io::InputStream** (p. 1742).

6.636.3.11 virtual std::size_t decaf::net::SocketInputStream::skip (std::size_t *num*) throw (io::IOException, lang::exceptions::UnsupportedOperationException) [virtual]

Not supported.

Exceptions:

an UnsupportedOperationException.

Implements **decaf::io::InputStream** (p. 1743).

6.636.3.12 virtual bool decaf::net::SocketInputStream::tryLock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3126).

6.636.3.13 virtual void decaf::net::SocketInputStream::unlock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3127).

6.636.3.14 virtual void decaf::net::SocketInputStream::wait (long long *millisecs*, int *nanos*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3128).

6.636.3.15 virtual void decaf::net::SocketInputStream::wait (long long *millisecs*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3130).

6.636.3.16 virtual void decaf::net::SocketInputStream::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3131).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketInputStream.h**

6.637 decaf::net::SocketOutputStream Class Reference

Output stream for performing write operations on a socket.

`#include <src/main/decaf/net/SocketOutputStream.h>`Inheritance diagram for decaf::net::SocketOutputStream:

Public Member Functions

- **SocketOutputStream** (**Socket::SocketHandle** socket)

  Constructor.

- virtual ~**SocketOutputStream** ()
- virtual void **write** (unsigned char c) throw (io::IOException)

  Writes a single byte to the output stream.

- virtual void **write** (const std::vector< unsigned char > &buffer) throw (io::IOException)

  Writes an array of bytes to the output stream.

- virtual void **write** (const unsigned char *buffer, std::size_t offset, std::size_t len) throw (io::IOException, lang::exceptions::NullPointerException)

  Writes an array of bytes to the output stream.

- virtual void **flush** () throw (io::IOException)

  Flush - does nothing.

- virtual void **close** () throw (decaf::io::IOException)

  Close - does nothing.

- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)

  Locks the object.

- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)

  Unlocks the object.

- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals the waiters on this object that it can now wake up and continue.

6.637.1 Detailed Description

Output stream for performing write operations on a socket.

6.637.2 Constructor & Destructor Documentation

6.637.2.1 decaf::net::SocketOutputStream::SocketOutputStream (Socket::SocketHandle *socket*)

Constructor.

Parameters:

socket the socket handle.

6.637.2.2 virtual decaf::net::SocketOutputStream::~SocketOutputStream () [virtual]

6.637.3 Member Function Documentation

6.637.3.1 virtual void decaf::net::SocketOutputStream::close () throw (decaf::io::IOException) [virtual]

Close - does nothing. It is the responsibility of the owner of the socket object to close it.

Exceptions:

IOException

Implements **decaf::io::Closeable** (p. 1019).

6.637.3.2 virtual void decaf::net::SocketOutputStream::flush () throw (io::IOException) [inline, virtual]

Flush - does nothing.

Exceptions:

IOException

Implements **decaf::io::OutputStream** (p. 2470).

6.637.3.3 virtual void decaf::net::SocketOutputStream::lock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3123).

6.637.3.4 virtual void decaf::net::SocketOutputStream::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3124).

6.637.3.5 virtual void decaf::net::SocketOutputStream::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3125).

6.637.3.6 virtual bool decaf::net::SocketOutputStream::tryLock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3126).

6.637.3.7 virtual void decaf::net::SocketOutputStream::unlock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3127).

6.637.3.8 virtual void decaf::net::SocketOutputStream::wait (long long *millisecs*, int *nanos*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3128).

6.637.3.9 virtual void decaf::net::SocketOutputStream::wait (long long *millisecs*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3130).

6.637.3.10 virtual void decaf::net::SocketOutputStream::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3131).

6.637.3.11 virtual void decaf::net::SocketOutputStream::write (const unsigned char * *buffer*, std::size_t *offset*, std::size_t *len*) throw (io::IOException, lang::exceptions::NullPointerException) [virtual]

Writes an array of bytes to the output stream.

Parameters:

buffer The array of bytes to write.

offset the position to start writing in buffer.

len The number of bytes from the buffer to be written.

Exceptions:

IOException thrown if an error occurs.

NullPointerException thrown if buffer is Null.

Implements **decaf::io::OutputStream** (p. 2471).

6.637.3.12 virtual void decaf::net::SocketOutputStream::write (const std::vector< unsigned char > & *buffer*) throw (io::IOException) [virtual]

Writes an array of bytes to the output stream.

Parameters:

buffer The bytes to write.

Exceptions:

IOException thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 2471).

6.637.3.13 virtual void decaf::net::SocketOutputStream::write (unsigned char *c*) throw (io::IOException) [virtual]

Writes a single byte to the output stream.

Parameters:

c the byte.

Exceptions:

IOException thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 2471).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketOutputStream.h**

6.638 decaf::net::SocketTimeoutException Class Reference

`#include <src/main/decaf/net/SocketTimeoutException.h>`Inheritance diagram for decaf::net::SocketTimeoutException:

Public Member Functions

- **SocketTimeoutException** () throw ()
  Default Constructor.
- **SocketTimeoutException** (const Exception &ex) throw ()
  Conversion Constructor from some other Exception.
- **SocketTimeoutException** (const **SocketTimeoutException** &ex) throw ()
  Copy Constructor.
- **SocketTimeoutException** (const char *file, const int lineNumber, const std::exception ***cause**, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- **SocketTimeoutException** (const std::exception ***cause**) throw ()
  Constructor.
- **SocketTimeoutException** (const char *file, const int lineNumber, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **SocketTimeoutException** * **clone** () const
  Clones this exception.
- virtual ~**SocketTimeoutException** () throw ()

6.638.1 Constructor & Destructor Documentation

6.638.1.1 decaf::net::SocketTimeoutException::SocketTimeoutException () throw () [inline]

Default Constructor.

6.638.1.2 decaf::net::SocketTimeoutException::SocketTimeoutException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.638.1.3 decaf::net::SocketTimeoutException::SocketTimeoutException (const SocketTimeoutException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.638.1.4 decaf::net::SocketTimeoutException::SocketTimeoutException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.638.1.5 decaf::net::SocketTimeoutException::SocketTimeoutException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.638.1.6 decaf::net::SocketTimeoutException::SocketTimeoutException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.638.1.7 virtual decaf::net::SocketTimeoutException::~SocketTimeoutException () throw () [inline, virtual]

6.638.2 Member Function Documentation

6.638.2.1 virtual SocketTimeoutException* decaf::net::SocketTimeoutException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::InterruptedIOException** (p. 1807).

The documentation for this class was generated from the following file:

6.640 decaf::internal::io::StandardErrorOutputStream Class Reference

Wrapper Around the Standard error Output facility on the current platform.

`#include <src/main/decaf/internal/io/StandardErrorOutputStream.h>`Inheritance diagram for decaf::internal::io::StandardErrorOutputStream:

Public Member Functions

- **StandardErrorOutputStream** ()

  Default Constructor.

- virtual ~**StandardErrorOutputStream** ()
- virtual void **write** (unsigned char c) throw (decaf::io::IOException)

  Writes a single byte to the output stream.

- virtual void **write** (const std::vector< unsigned char > &buffer) throw (decaf::io::IOException)

  Writes an array of bytes to the output stream.

- virtual void **write** (const unsigned char *buffer, std::size_t offset, std::size_t len) throw (decaf::io::IOException, lang::exceptions::NullPointerException)

  Writes an array of bytes to the output stream.

- virtual void **flush** () throw (decaf::io::IOException)

  Invokes flush on the target output stream.

- virtual void **close** () throw (decaf::io::IOException)

  Invokes close on the target output stream.

- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)

  Locks the object.

- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)

  Unlocks the object.

- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals the waiters on this object that it can now wake up and continue.

6.640.1 Detailed Description

Wrapper Around the Standard error Output facility on the current platform. This allows for the use of alternate output methods on platforms or compilers that do not support `std::cerr`.

6.640.2 Constructor & Destructor Documentation

6.640.2.1 decaf::internal::io::StandardErrorOutputStream::StandardErrorOutputStream ()

Default Constructor.

6.640.2.2 virtual decaf::internal::io::StandardErrorOutputStream::~StandardErrorOutputStream () [virtual]

6.640.3 Member Function Documentation

6.640.3.1 virtual void decaf::internal::io::StandardErrorOutputStream::close () throw (decaf::io::IOException) [inline, virtual]

Invokes close on the target output stream. throws IOException if an error occurs

Implements **decaf::io::Closeable** (p. 1019).

6.640.3.2 virtual void decaf::internal::io::StandardErrorOutputStream::flush () throw (decaf::io::IOException) [virtual]

Invokes flush on the target output stream. throws **decaf::io::IOException** (p. 1820) if an error occurs

Implements **decaf::io::OutputStream** (p. 2470).

6.640.3.3 virtual void decaf::internal::io::StandardErrorOutputStream::lock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3123).

6.640.3.4 virtual void decaf::internal::io::StandardErrorOutputStream::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3124).

6.640.3.5 virtual void decaf::internal::io::StandardErrorOutputStream::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3125).

6.640.3.6 virtual bool decaf::internal::io::StandardErrorOutputStream::tryLock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3126).

6.640.3.7 virtual void decaf::internal::io::StandardErrorOutputStream::unlock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3127).

6.640.3.8 virtual void decaf::internal::io::StandardErrorOutputStream::wait (long long *millisecs*, int *nanos*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3128).

6.640.3.9 virtual void decaf::internal::io::StandardErrorOutputStream::wait (long long *millisecs*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3130).

6.640.3.10 virtual void decaf::internal::io::StandardErrorOutputStream::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3131).

6.640.3.11 virtual void decaf::internal::io::StandardErrorOutputStream::write (const unsigned char * *buffer*, std::size_t *offset*, std::size_t *len*) throw (decaf::io::IOException, lang::exceptions::NullPointerException) [virtual]

Writes an array of bytes to the output stream.

Parameters:

buffer The array of bytes to write.

offset The position to start writing in buffer.

len The number of bytes from the buffer to be written.

Exceptions:

decaf::io::IOException *(*p. ***1820)*** thrown if an error occurs.

NullPointerException if buffer is null.

Implements **decaf::io::OutputStream** (p. 2471).

6.640.3.12 virtual void decaf::internal::io::StandardErrorOutputStream::write (const std::vector< unsigned char > & *buffer*) throw (decaf::io::IOException) [virtual]

Writes an array of bytes to the output stream.

Parameters:

buffer The bytes to write.

Exceptions:

IOException thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 2471).

6.640.3.13 virtual void decaf::internal::io::StandardErrorOutputStream::write (unsigned char *c*) throw (decaf::io::IOException) [virtual]

Writes a single byte to the output stream.

Parameters:

c the byte.

Exceptions:

IOException thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 2471).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/io/**StandardErrorOutputStream.h**

6.641 decaf::internal::io::StandardInputStream Class Reference

`#include <src/main/decaf/internal/io/StandardInputStream.h>`Inheritance diagram for decaf::internal::io::StandardInputStream:

Public Member Functions

- **StandardInputStream** ()
- virtual ~**StandardInputStream** ()
- virtual std::size_t **available** () const throw (decaf::io::IOException)

  Indicates the number of bytes available.

- virtual int **read** () throw (decaf::io::IOException)

  Reads a single byte from the buffer.

- virtual int **read** (unsigned char *buffer, std::size_t offset, std::size_t bufferSize) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)

  Reads an array of bytes from the buffer.

- virtual void **close** () throw (decaf::io::IOException)

  Closes the target input stream.

- virtual std::size_t **skip** (std::size_t num) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

  Skips over and discards n bytes of data from this input stream.

- virtual void **mark** (int readLimit DECAF_UNUSED)

  Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

- virtual void **reset** () throw (decaf::io::IOException)

  Repositions this stream to the position at the time the mark method was last called on this input stream.

- virtual bool **markSupported** () const

  Determines if this input stream supports the mark and reset methods.

Protected Member Functions

- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)

  Locks the object.

- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)

  Unlocks the object.

- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals the waiters on this object that it can now wake up and continue.

6.641.1 Constructor & Destructor Documentation

6.641.1.1 decaf::internal::io::StandardInputStream::StandardInputStream ()

6.641.1.2 virtual decaf::internal::io::StandardInputStream::~StandardInputStream () [virtual]

6.641.2 Member Function Documentation

6.641.2.1 virtual std::size_t decaf::internal::io::StandardInputStream::available () const throw (decaf::io::IOException) [virtual]

Indicates the number of bytes available.

Returns:

The number of bytes until the end of the internal buffer.

Implements **decaf::io::InputStream** (p. 1741).

6.641.2.2 virtual void decaf::internal::io::StandardInputStream::close () throw (decaf::io::IOException) [inline, virtual]

Closes the target input stream.

Exceptions:

IOException thrown if an error occurs.

Implements **decaf::io::Closeable** (p. 1019).

6.641.2.3 virtual void decaf::internal::io::StandardInputStream::lock () throw (decaf::lang::exceptions::RuntimeException) [inline, protected, virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3123).

6.641.2.4 virtual void decaf::internal::io::StandardInputStream::mark (int readLimit *DECAF_UNUSED*) [inline, virtual]

Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes. If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Parameters:

readLimit - max bytes read before marked position is invalid.

Implements **decaf::io::InputStream** (p. 1741).

6.641.2.5 virtual bool decaf::internal::io::StandardInputStream::markSupported () const [inline, virtual]

Determines if this input stream supports the mark and reset methods. Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

Returns:

true if this stream instance supports marks

Implements **decaf::io::InputStream** (p. 1741).

6.641.2.6 virtual void decaf::internal::io::StandardInputStream::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, protected, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3124).

6.641.2.7 virtual void decaf::internal::io::StandardInputStream::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, protected, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3125).

6.641.2.8 virtual int decaf::internal::io::StandardInputStream::read (unsigned char * *buffer*, std::size_t *offset*, std::size_t *bufferSize*) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException) [virtual]

Reads an array of bytes from the buffer.

Parameters:

buffer (out) the target buffer.

offset the position in the buffer to start reading from.

bufferSize the size of the output buffer.

Returns:

The number of bytes read.

Exceptions:

IOException thrown if an error occurs.

NullPointerException if buffer is null.

Implements **decaf::io::InputStream** (p. 1742).

6.641.2.9 virtual int decaf::internal::io::StandardInputStream::read () throw (decaf::io::IOException) [virtual]

Reads a single byte from the buffer.

Returns:

The next byte.

Exceptions:

IOException thrown if an error occurs.

Implements **decaf::io::InputStream** (p. 1742).

6.641.2.10 virtual void decaf::internal::io::StandardInputStream::reset () throw (decaf::io::IOException) [virtual]

Repositions this stream to the position at the time the mark method was last called on this input stream. If the method markSupported returns true, then: ∗ If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an IOException might be thrown. ∗ If such an IOException is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset. If the method markSupported returns false, then: ∗ The call to reset may throw an IOException. ∗ If an IOException is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

Exceptions:

IOException

Implements **decaf::io::InputStream** (p. 1742).

6.641.2.11 virtual std::size_t decaf::internal::io::StandardInputStream::skip (std::size_t *num*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Skips over and discards n bytes of data from this input stream. The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned. If n is negative, no bytes are skipped.

The skip method of InputStream creates a byte array and then repeatedly reads into it until n bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters:

num - the number of bytes to skip

Returns:

total bytes skipped

Exceptions:

IOException if an error occurs

UnsupportedOperationException If skip is not supported.

Implements **decaf::io::InputStream** (p. 1743).

6.641.2.12 virtual bool decaf::internal::io::StandardInputStream::tryLock () throw (decaf::lang::exceptions::RuntimeException) [inline, protected, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3126).

6.641.2.13 virtual void decaf::internal::io::StandardInputStream::unlock () throw (decaf::lang::exceptions::RuntimeException) [inline, protected, virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3127).

6.641.2.14 virtual void decaf::internal::io::StandardInputStream::wait (long long *millisecs*, int *nanos*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, protected, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3128).

6.641.2.15 virtual void decaf::internal::io::StandardInputStream::wait (long long *millisecs*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, protected, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3130).

6.641.2.16 virtual void decaf::internal::io::StandardInputStream::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, protected, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3131).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/io/**StandardInputStream.h**

6.642 decaf::internal::io::StandardOutputStream Class Reference

`#include <src/main/decaf/internal/io/StandardOutputStream.h>`Inheritance diagram for decaf::internal::io::StandardOutputStream:

Public Member Functions

- **StandardOutputStream** ()
- virtual ~**StandardOutputStream** ()
- virtual void **write** (unsigned char c) throw (decaf::io::IOException)

  Writes a single byte to the output stream.

- virtual void **write** (const std::vector< unsigned char > &buffer) throw (decaf::io::IOException)

  Writes an array of bytes to the output stream.

- virtual void **write** (const unsigned char *buffer, std::size_t offset, std::size_t len) throw (decaf::io::IOException, lang::exceptions::NullPointerException)

  Writes an array of bytes to the output stream.

- virtual void **flush** () throw (decaf::io::IOException)

  Invokes flush on the target output stream.

- virtual void **close** () throw (decaf::io::IOException)

  Invokes close on the target output stream.

- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)

  Locks the object.

- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)

  Unlocks the object.

- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals the waiters on this object that it can now wake up and continue.

6.642.1 Constructor & Destructor Documentation

6.642.1.1 decaf::internal::io::StandardOutputStream::StandardOutputStream ()

6.642.1.2 virtual decaf::internal::io::StandardOutputStream::~StandardOutputStream () [virtual]

6.642.2 Member Function Documentation

6.642.2.1 virtual void decaf::internal::io::StandardOutputStream::close () throw (decaf::io::IOException) [inline, virtual]

Invokes close on the target output stream. throws IOException if an error occurs

Implements **decaf::io::Closeable** (p. 1019).

6.642.2.2 virtual void decaf::internal::io::StandardOutputStream::flush () throw (decaf::io::IOException) [virtual]

Invokes flush on the target output stream. throws IOException if an error occurs

Implements **decaf::io::OutputStream** (p. 2470).

6.642.2.3 virtual void decaf::internal::io::StandardOutputStream::lock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3123).

6.642.2.4 virtual void decaf::internal::io::StandardOutputStream::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3124).

6.642.2.5 virtual void decaf::internal::io::StandardOutputStream::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3125).

6.642.2.6 virtual bool decaf::internal::io::StandardOutputStream::tryLock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3126).

6.642.2.7 virtual void decaf::internal::io::StandardOutputStream::unlock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3127).

6.642.2.8 virtual void decaf::internal::io::StandardOutputStream::wait (long long *millisecs*, int *nanos*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3128).

6.642.2.9 virtual void decaf::internal::io::StandardOutputStream::wait (long long *millisecs*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3130).

6.642.2.10 virtual void decaf::internal::io::StandardOutputStream::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3131).

6.642.2.11 virtual void decaf::internal::io::StandardOutputStream::write (const unsigned char * *buffer*, std::size_t *offset*, std::size_t *len*) throw (decaf::io::IOException, lang::exceptions::NullPointerException) [virtual]

Writes an array of bytes to the output stream.

Parameters:

buffer The array of bytes to write.

offset,the position to start writing in buffer.

len The number of bytes from the buffer to be written.

Exceptions:

IOException thrown if an error occurs.

NullPointerException if buffer is null.

Implements **decaf::io::OutputStream** (p. 2471).

6.642.2.12 virtual void decaf::internal::io::StandardOutputStream::write (const std::vector< unsigned char > & *buffer*) throw (decaf::io::IOException) [virtual]

Writes an array of bytes to the output stream.

Parameters:

buffer The bytes to write.

Exceptions:

IOException thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 2471).

6.642.2.13 virtual void decaf::internal::io::StandardOutputStream::write (unsigned char *c*) throw (decaf::io::IOException) [virtual]

Writes a single byte to the output stream.

Parameters:

c the byte.

Exceptions:

IOException thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 2471).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/io/**StandardOutputStream.h**

6.643 cms::Startable Class Reference

Interface for a class that implements the start method.

`#include <src/main/cms/Startable.h>`Inheritance diagram for cms::Startable:

Public Member Functions

- virtual ~**Startable** ()
- virtual void **start** ()=0 throw (CMSException)

  Starts the service.

6.643.1 Detailed Description

Interface for a class that implements the start method. An object that implements the **Startable** (p. 3014) interface implies that until its start method is called it will be considered to be in a closed or stopped state and will throw an Exception to indicate that it is not in an started state if one of its methods is called.

Since:

1.0

6.643.2 Constructor & Destructor Documentation

6.643.2.1 virtual cms::Startable::~Startable () [inline, virtual]

6.643.3 Member Function Documentation

6.643.3.1 virtual void cms::Startable::start () throw (CMSException) [pure virtual]

Starts the service.

Exceptions:

CMSException *(*p. ***1031****)* if an internal error occurs while starting.

Implemented in **activemq::core::ActiveMQConnection** (p. 242).

The documentation for this class was generated from the following file:

- src/main/cms/**Startable.h**

6.646 decaf::util::StlList< E > Class Template Reference

List (p. 1984) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type.

`#include <src/main/decaf/util/StlList.h>`Inheritance diagram for decaf::util::StlList< E >:

Data Structures

- class **ConstStlListIterator**
- class **StlListIterator**

Public Member Functions

- **StlList** ()

  Default constructor - does nothing.

- **StlList** (const **StlList** &source)

  Copy constructor - copies the content of the given set into this one.

- **StlList** (const **Collection**< E > &source)

  Copy constructor - copies the content of the given set into this one.

- virtual ~**StlList** ()
- virtual bool **equals** (const **StlList** &source) const

- virtual **Iterator**< E > * **iterator** ()

  Returns:

  an iterator over a set of elements of type T.

- virtual **Iterator**< E > * **iterator** () const
- virtual **ListIterator**< E > * **listIterator** ()

  Returns:

  a list iterator over the elements in this list (in proper sequence).

- virtual **ListIterator**< E > * **listIterator** () const
- virtual **ListIterator**< E > * **listIterator** (std::size_t index) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

  Parameters:

  index *index of first element to be returned from the list iterator (by a call to the next method).*

  Returns:

  a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions:

IndexOutOfBoundsException *if the index is out of range (index < 0 || index >* ***size()*** *(p. 1062))*

- virtual **ListIterator**< E > * **listIterator** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
- virtual void **copy** (const **StlList** &source)

- virtual void **clear** () throw (lang::exceptions::UnsupportedOperationException)

Removes all of the elements from this collection (optional operation).
The collection will be empty after this method returns.
This implementation iterates over this collection, removing each element using the ***Iterator.remove*** *(p. 1833) operation. Most implementations will probably choose to override this method for efficiency.*
Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.
Exceptions:

UnsupportedOperationException *if the clear operation is not supported by this collection*

- virtual bool **contains** (const E &value) const throw (lang::Exception)

Returns true if this collection contains the specified element.
This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.
Parameters:

value *- the value whose presence is to be queried for in this* ***Collection*** *(p. 1054).*
Returns:

true if the value is contained in this collection
Exceptions:

Exception *if an error occurs,*

- virtual std::size_t **indexOf** (const E &value) throw (decaf::lang::exceptions::NoSuchElementException)

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.
More formally, returns the lowest index i such that get(i) == value, or -1 if there is no such index.
Parameters:

value *- element to search for*
Returns:

the index of the first occurrence of the specified element in this list,
Exceptions:

NoSuchElementException *if value is not in the list*

- virtual std::size_t **lastIndexOf** (const E &value) throw (decaf::lang::exceptions::NoSuchElementException)

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.
More formally, returns the highest index i such that get(i) == value or -1 if there is no such index.

Parameters:

value *- element to search for*

Returns:

the index of the last occurrence of the specified element in this list.

Exceptions:

NoSuchElementException *if value is not in the list*

- virtual bool **isEmpty** () const

Returns true if this collection contains no elements.
This implementation returns ***size()*** *(p. 1062) == 0.*

Returns:

true if the size method return 0.

- virtual std::size_t **size** () const

Returns the number of elements in this collection.
If this collection contains more than Integer.MAX_ VALUE elements, returns Integer.MAX_ VALUE.

Returns:

the number of elements in this collection

- virtual E **get** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Gets the element contained at position passed.

Parameters:

index *- position to get*

Returns:

value at index

- virtual E **set** (std::size_t index, const E &element) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Replaces the element at the specified position in this list with the specified element.

Parameters:

index *- index of the element to replace*
element *- element to be stored at the specified position*

Returns:

the element previously at the specified position

Exceptions:

IndexOutOfBoundsException *- if the index is greater than size*

- virtual bool **add** (const E &value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException)

Returns true if this collection changed as a result of the call.
(Returns false if this collection does not permit duplicates and already contains the specified element.)
Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. ***Collection*** *(p. 1054) classes should clearly specify in their documentation any restrictions on what elements may be added.*

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.
For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters:

value *- reference to the element to add.*

Returns:

true if the element was added

Exceptions:

UnsupportedOperationException
IllegalArgumentException
IllegalStateException *if the element cannot be added at this time due to insertion restrictions*

- virtual void **add** (std::size_t index, const E &element) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IndexOutOfBoundsException)

  Inserts the specified element at the specified position in this list.
  Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

  Parameters:

  index *- index at which the specified element is to be inserted*
  element *- element to be inserted*

  Exceptions:

  IndexOutOfBoundsException *- if the index is greater than size*
  UnsupportedOperationException *- If the collection is non-modifiable.*

- virtual bool **addAll** (std::size_t index, const **Collection**< E > &source) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException)

  Inserts all of the elements in the specified collection into this list at the specified position (optional operation).
  Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

  Parameters:

  index *The index at which to insert the first element from the specified collection*
  source *The* ***Collection*** *(p. 1054) containing elements to be added to this list*

  Returns:

  true if this list changed as a result of the call

  Exceptions:

  IndexOutOfBoundsException *- if the index is greater than size*
  UnsupportedOperationException *- If the collection is non-modifiable.*

- virtual bool **remove** (const E &value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)

  Removes a single instance of the specified element from this collection, if it is present (optional operation).

More formally, removes the first element e such that e == o, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).
This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.
Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.
Parameters:

value *- element to be removed from this collection, if present*
Returns:

true if an element was removed as a result of this call
Exceptions:

UnsupportedOperationException *if the remove operation is not supported by this collection.*
IllegalArgumentException *If the value is not a valid entry for this* ***Collection*** *(p. 1054).*

- virtual E **remove** (std::size_t index) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException)

Removes the element at the specified position in this list.
Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.
Parameters:

index *- the index of the element to be removed*
Returns:

the element previously at the specified position
Exceptions:

IndexOutOfBoundsException *- if the index is greater than size*
UnsupportedOperationException *- If the collection is non-modifiable.*

6.646.1 Detailed Description

template<typename E> class decaf::util::StlList< E >

List (p. 1984) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type.

6.646.2 Constructor & Destructor Documentation

6.646.2.1 template<typename E> decaf::util::StlList< E >::StlList () [inline]

Default constructor - does nothing.

6.646.2.2 template<typename E> decaf::util::StlList< E >::StlList (const StlList< E > & *source*) [inline]

Copy constructor - copies the content of the given set into this one.

Parameters:

source The source set.

6.646.2.3 template<typename E> decaf::util::StlList< E >::StlList (const Collection< E > & *source*) [inline]

Copy constructor - copies the content of the given set into this one.

Parameters:

source The source set.

6.646.2.4 template<typename E> virtual decaf::util::StlList< E >::~StlList () [inline, virtual]

6.646.3 Member Function Documentation

6.646.3.1 template<typename E> virtual void decaf::util::StlList< E >::add (std::size_t *index*, const E & *element*) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IndexOutOfBoundsException) [inline, virtual]

Inserts the specified element at the specified position in this list.

Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters:

index - index at which the specified element is to be inserted

element - element to be inserted

Exceptions:

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

Implements **decaf::util::List< E >** (p. 1985).

6.646.3.2 template<typename E> virtual bool decaf::util::StlList< E >::add (const E & *value*) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException) [inline, virtual]

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 1054) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters:

value - reference to the element to add.

Returns:

true if the element was added

Exceptions:

UnsupportedOperationException

IllegalArgumentException

IllegalStateException if the element cannot be added at this time due to insertion restrictions

Implements **decaf::util::Collection< E >** (p. 1056).

Referenced by decaf::util::StlList< Pointer< BackupTransport > >::addAll().

6.646.3.3 template<typename E> virtual bool decaf::util::StlList< E >::addAll (std::size_t *index*, const Collection< E > & *source*) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException) [inline, virtual]

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters:

index The index at which to insert the first element from the specified collection

source The **Collection** (p. 1054) containing elements to be added to this list

Returns:

true if this list changed as a result of the call

Exceptions:

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

Implements **decaf::util::List< E >** (p. 1985).

6.646.3.4 template<typename E> virtual void decaf::util::StlList< E >::clear () throw (lang::exceptions::UnsupportedOperationException) [inline, virtual]

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1833) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this collection

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 151).

6.646.3.5 template<typename E> virtual bool decaf::util::StlList< E >::contains (const E & *value*) const throw (lang::Exception) [inline, virtual]

Returns true if this collection contains the specified element.

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Parameters:

value - the value whose presence is to be queried for in this **Collection** (p. 1054).

Returns:

true if the value is contained in this collection

Exceptions:

Exception if an error occurs,

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 152).

6.646.3.6 template<typename E> virtual void decaf::util::StlList< E >::copy (const StlList< E > & *source*) [inline, virtual]

Referenced by decaf::util::StlList< Pointer< BackupTransport > >::StlList().

6.646.3.7 template<typename E> virtual bool decaf::util::StlList< E >::equals (const StlList< E > & *source*) const [inline, virtual]

6.646.3.8 template<typename E> virtual E decaf::util::StlList< E >::get (std::size_t *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [inline, virtual]

Gets the element contained at position passed.

Parameters:

index - position to get

Returns:

value at index

Implements **decaf::util::List< E >** (p. 1986).

6.646.3.9 template<typename E> virtual std::size_t decaf::util::StlList< E >::indexOf (const E & *value*) throw (decaf::lang::exceptions::NoSuchElementException) [inline, virtual]

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the lowest index i such that get(i) == value, or -1 if there is no such index.

Parameters:

value - element to search for

Returns:

the index of the first occurrence of the specified element in this list,

Exceptions:

NoSuchElementException if value is not in the list

Implements **decaf::util::List< E >** (p. 1986).

6.646.3.10 template<typename E> virtual bool decaf::util::StlList< E >::isEmpty () const [inline, virtual]

Returns true if this collection contains no elements.

This implementation returns **size()** (p. 1062) == 0.

Returns:

true if the size method return 0.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 153).

6.646.3.11 template<typename E> virtual Iterator<E>* decaf::util::StlList< E >::iterator () const [inline, virtual]

Implements **decaf::lang::Iterable< E >** (p. 1830).

6.646.3.12 template<typename E> virtual Iterator<E>* decaf::util::StlList< E >::iterator () [inline, virtual]

Returns:

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< E >** (p. 1830).

6.646.3.13 template<typename E> virtual std::size_t decaf::util::StlList< E >::lastIndexOf (const E & *value*) throw (decaf::lang::exceptions::NoSuchElementException) [inline, virtual]

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the highest index i such that get(i) == value or -1 if there is no such index.

Parameters:

value - element to search for

Returns:

the index of the last occurrence of the specified element in this list.

Exceptions:

NoSuchElementException if value is not in the list

Implements **decaf::util::List< E >** (p. 1987).

6.646.3.14 template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator (std::size_t *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [inline, virtual]

Implements **decaf::util::List< E >** (p. 1987).

6.646.3.15 template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator (std::size_t *index*) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [inline, virtual]

Parameters:

index index of first element to be returned from the list iterator (by a call to the next method).

Returns:

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions:

IndexOutOfBoundsException if the index is out of range (index < 0 || index > **size()** (p. 1062))

Implements **decaf::util::List< E >** (p. 1988).

6.646.3.16 template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator () const [inline, virtual]

Implements **decaf::util::List< E >** (p. 1988).

6.646.3.17 template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator () [inline, virtual]

Returns:

a list iterator over the elements in this list (in proper sequence).

Implements **decaf::util::List< E >** (p. 1988).

6.646.3.18 template<typename E> virtual E decaf::util::StlList< E >::remove (std::size_t *index*) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException) [inline, virtual]

Removes the element at the specified position in this list.

Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters:

index - the index of the element to be removed

Returns:

the element previously at the specified position

Exceptions:

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

Implements **decaf::util::List< E >** (p. 1989).

6.646.3.19 template<typename E> virtual bool decaf::util::StlList< E >::remove (const E & *value*) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException) [inline, virtual]

Removes a single instance of the specified element from this collection, if it is present (optional operation).

More formally, removes the first element e such that e == o, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Parameters:

value - element to be removed from this collection, if present

Returns:

true if an element was removed as a result of this call

Exceptions:

UnsupportedOperationException if the remove operation is not supported by this collection.

IllegalArgumentException If the value is not a valid entry for this **Collection** (p. 1054).

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 155).

6.646.3.20 template<typename E> virtual E decaf::util::StlList< E >::set (std::size_t *index*, const E & *element*) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [inline, virtual]

Replaces the element at the specified position in this list with the specified element.

Parameters:

index - index of the element to replace

element - element to be stored at the specified position

Returns:

the element previously at the specified position

Exceptions:

IndexOutOfBoundsException - if the index is greater than size

Implements **decaf::util::List< E >** (p. 1989).

6.646.3.21 template<typename E> virtual std::size_t decaf::util::StlList< E >::size () const [inline, virtual]

Returns the number of elements in this collection.

If this collection contains more than Integer.MAX_VALUE elements, returns Integer.MAX_VALUE.

Returns:

the number of elements in this collection

Implements **decaf::util::Collection< E >** (p. 1062).

Referenced by decaf::util::StlList< Pointer< BackupTransport > >::add(), decaf::util::StlList< Pointer< BackupTransport > >::addAll(), decaf::util::StlList< Pointer< BackupTransport > >::get(), decaf::util::StlList< Pointer< BackupTransport > >::lastIndexOf(), decaf::util::StlList< Pointer< BackupTransport > >::listIterator(), decaf::util::StlList< Pointer< BackupTransport > >::remove(), and decaf::util::StlList< Pointer< BackupTransport > >::set().

6.647 decaf::util::StlMap< K, V, COMPARATOR > Class Template Reference

Map (p. 2094) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

`#include <src/main/decaf/util/StlMap.h>`Inheritance diagram for decaf::util::StlMap< K, V, COMPARATOR >:

Public Member Functions

- **StlMap** ()

  Default constructor - does nothing.

- **StlMap** (const **StlMap** &source)

  Copy constructor - copies the content of the given map into this one.

- **StlMap** (const **Map**< K, V, COMPARATOR > &source)

  Copy constructor - copies the content of the given map into this one.

- virtual ~**StlMap** ()
- virtual bool **equals** (const **StlMap** &source) const

- virtual bool **equals** (const **Map**< K, V, COMPARATOR > &source) const

  Comparison, equality is dependent on the method of determining if the element are equal.
  Parameters:

  source *- **Map** (p. 2094) to compare to this one.*
  Returns:

  *true if the **Map** (p. 2094) passed is equal in value to this one.*

- virtual void **copy** (const **StlMap** &source)

- virtual void **copy** (const **Map**< K, V, COMPARATOR > &source)

  Copies the content of the source map into this map.
  Erases all existing data in this map.
  Parameters:

  source *The source object to copy from.*

- virtual void **clear** () throw (decaf::lang::exceptions::UnsupportedOperationException)

  Removes all keys and values from this map.
  Exceptions:

  UnsupportedOperationException *if this map is unmodifiable.*

- virtual bool **containsKey** (const K &key) const

  Indicates whether or this map contains a value for the given key.

Parameters:

key *The key to look up.*

Returns:

true if this map contains the value, otherwise false.

- virtual bool **containsValue** (const V &value) const

  Indicates whether or this map contains a value for the given value, i.e.
  they are equal, this is done by operator== so the types must pass equivalence testing in this manner.

  Parameters:

  value *The Value to look up.*

  Returns:

  true if this map contains the value, otherwise false.

- virtual bool **isEmpty** () const

  Returns:

  *if the **Map** (p. 2094) contains any element or not, TRUE or FALSE*

- virtual std::size_t **size** () const

  Returns:

  The number of elements (key/value pairs) in this map.

- virtual V & **get** (const K &key) throw (lang::exceptions::NoSuchElementException)

  *Gets the value mapped to the specified key in the **Map** (p. 2094).*
  If there is no element in the map whose key is equivalent to the key provided then a NoSuchElementException is thrown.

  Parameters:

  key *The search key.*

  Returns:

  A reference to the value for the given key.

  Exceptions:

  NoSuchElementException *if the key requests doesn't exist in the **Map** (p. 2094).*

- virtual const V & **get** (const K &key) const throw (lang::exceptions::NoSuchElementException)

  *Gets the value mapped to the specified key in the **Map** (p. 2094).*
  If there is no element in the map whose key is equivalent to the key provided then a NoSuchElementException is thrown.

  Parameters:

  key *The search key.*

  Returns:

  A {const} reference to the value for the given key.

  Exceptions:

  NoSuchElementException *if the key requests doesn't exist in the **Map** (p. 2094).*

- virtual void **put** (const K &key, const V &value) throw (decaf::lang::exceptions::UnsupportedOperationException)

  Sets the value for the specified key.

Parameters:

key *The target key.*
value *The value to be set.*

Exceptions:

UnsupportedOperationException *if this map is unmodifiable.*

- virtual void **putAll** (const **StlMap**< K, V, COMPARATOR > &other) throw (decaf::lang::exceptions::UnsupportedOperationException)

- virtual void **putAll** (const **Map**< K, V, COMPARATOR > &other) throw (decaf::lang::exceptions::UnsupportedOperationException)

  Stores a copy of the Mappings contained in the other ***Map*** *(p. 2094) in this one.*

  Parameters:

  other *A* ***Map*** *(p. 2094) instance whose elements are to all be inserted in this* ***Map*** *(p. 2094).*

  Exceptions:

  UnsupportedOperationException *If the implementing class does not support the putAll operation.*

- virtual V **remove** (const K &key) throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

  Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

  Parameters:

  key *The search key.*

  Returns:

  a copy of the element that was previously mapped to the given key

  Exceptions:

  NoSuchElementException *if this key is not in the* ***Map*** *(p. 2094).*
  UnsupportedOperationException *if this map is unmodifiable.*

- virtual std::vector< K > **keySet** () const

  Returns a ***Set*** *(p. 2905) view of the mappings contained in this map.*
  The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the ***Iterator.remove*** *(p. 1833),* ***Set.remove*** *(p. 155), removeAll, retainAll and clear operations. It does not support the add or addAll operations.*

  Returns:

  the entire set of keys in this map as a std::vector.

- virtual std::vector< V > **values** () const

  Returns:

  the entire set of values in this map as a std::vector.

- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)

  Locks the object.

- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)

  Unlocks the object.

- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals the waiters on this object that it can now wake up and continue.

6.647.1 Detailed Description

template<typename K, typename V, typename COMPARATOR = std::less<K>> class decaf::util::StlMap< K, V, COMPARATOR >

Map (p. 2094) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

Since:

1.0

6.647.2 Constructor & Destructor Documentation

6.647.2.1 template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::StlMap< K, V, COMPARATOR >::StlMap () [inline]

Default constructor - does nothing.

6.647.2.2 template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::StlMap< K, V, COMPARATOR >::StlMap (const StlMap< K, V, COMPARATOR > & *source*) [inline]

Copy constructor - copies the content of the given map into this one.

Parameters:

source The source map.

6.647.2.3 template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::StlMap< K, V, COMPARATOR >::StlMap (const Map< K, V, COMPARATOR > & *source*) [inline]

Copy constructor - copies the content of the given map into this one.

Parameters:

source The source map.

6.647.2.4 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual decaf::util::StlMap< K, V, COMPARATOR >::~StlMap () [inline, virtual]

6.647.3 Member Function Documentation

6.647.3.1 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::clear () throw (decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]

Removes all keys and values from this map.

Exceptions:

UnsupportedOperationException if this map is unmodifiable.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2095).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::copy().

6.647.3.2 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::containsKey (const K & *key*) const [inline, virtual]

Indicates whether or this map contains a value for the given key.

Parameters:

key The key to look up.

Returns:

true if this map contains the value, otherwise false.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2096).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::equals().

6.647.3.3 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::containsValue (const V & *value*) const [inline, virtual]

Indicates whether or this map contains a value for the given value, i.e.

they are equal, this is done by operator== so the types must pass equivalence testing in this manner.

Parameters:

value The Value to look up.

Returns:

true if this map contains the value, otherwise false.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2097).

6.647.3.4 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::copy (const Map< K, V, COMPARATOR > & *source*) [inline, virtual]

Copies the content of the source map into this map.

Erases all existing data in this map.

Parameters:

source The source object to copy from.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2098).

6.647.3.5 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::copy (const StlMap< K, V, COMPARATOR > & *source*) [inline, virtual]

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::StlMap().

6.647.3.6 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::equals (const Map< K, V, COMPARATOR > & *source*) const [inline, virtual]

Comparison, equality is dependent on the method of determining if the element are equal.

Parameters:

source - **Map** (p. 2094) to compare to this one.

Returns:

true if the **Map** (p. 2094) passed is equal in value to this one.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2098).

6.647.3.7 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::equals (const StlMap< K, V, COMPARATOR > & *source*) const [inline, virtual]

6.647.3.8 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual const V& decaf::util::StlMap< K, V, COMPARATOR >::get (const K & *key*) const throw (lang::exceptions::NoSuchElementException) [inline, virtual]

Gets the value mapped to the specified key in the **Map** (p. 2094).

If there is no element in the map whose key is equivalent to the key provided then a NoSuchElementException is thrown.

Parameters:

key The search key.

Returns:

A {const} reference to the value for the given key.

Exceptions:

NoSuchElementException if the key requests doesn't exist in the **Map** (p. 2094).

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2098).

6.647.3.9 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual V& decaf::util::StlMap< K, V, COMPARATOR >::get (const K & *key*) throw (lang::exceptions::NoSuchElementException) [inline, virtual]

Gets the value mapped to the specified key in the **Map** (p. 2094).

If there is no element in the map whose key is equivalent to the key provided then a NoSuchElementException is thrown.

Parameters:

key The search key.

Returns:

A reference to the value for the given key.

Exceptions:

NoSuchElementException if the key requests doesn't exist in the **Map** (p. 2094).

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2099).

6.647.3.10 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::isEmpty () const [inline, virtual]

Returns:

if the **Map** (p. 2094) contains any element or not, TRUE or FALSE

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2100).

6.647.3.11 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual std::vector<K> decaf::util::StlMap< K, V, COMPARATOR >::keySet () const [inline, virtual]

Returns a **Set** (p. 2905) view of the mappings contained in this map.

The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1833), **Set.remove** (p. 155), removeAll, retainAll and clear operations. It does not support the add or addAll operations.

Returns:

the entire set of keys in this map as a std::vector.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2101).

6.647.3.12 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::lock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3123).

6.647.3.13 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3124).

6.647.3.14 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3125).

6.647.3.15 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::put (const K & *key*, const V & *value*) throw (decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]

Sets the value for the specified key.

Parameters:

key The target key.

value The value to be set.

Exceptions:

UnsupportedOperationException if this map is unmodifiable.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2102).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::putAll().

6.647.3.16 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::putAll (const Map< K, V, COMPARATOR > & *other*) throw (decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]

Stores a copy of the Mappings contained in the other **Map** (p. 2094) in this one.

Parameters:

other A **Map** (p. 2094) instance whose elements are to all be inserted in this **Map** (p. 2094).

Exceptions:

UnsupportedOperationException If the implementing class does not support the putAll operation.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2102).

6.647.3.17 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::putAll (const StlMap< K, V, COMPARATOR > & *other*) throw (decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::copy().

6.647.3.18 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual V decaf::util::StlMap< K, V, COMPARATOR >::remove (const K & *key*) throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Parameters:

key The search key.

Returns:

a copy of the element that was previously mapped to the given key

Exceptions:

NoSuchElementException if this key is not in the **Map** (p. 2094).

UnsupportedOperationException if this map is unmodifiable.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2103).

6.647.3.19 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual std::size_t decaf::util::StlMap< K, V, COMPARATOR >::size () const [inline, virtual]

Returns:

The number of elements (key/value pairs) in this map.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2104).

6.647.3.20 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::tryLock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3126).

6.647.3.21 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::unlock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3127).

6.647.3.22 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual std::vector<V> decaf::util::StlMap< K, V, COMPARATOR >::values () const [inline, virtual]

Returns:

the entire set of values in this map as a std::vector.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 2105).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::values().

6.647.3.23 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::wait (long long *millisecs*, int *nanos*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3128).

6.647.3.24 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::wait (long long *millisecs*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3130).

6.647.3.25 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3131).

The documentation for this class was generated from the following file:

Data Structures

- class **QueueIterator**

Public Member Functions

- **StlQueue** ()
- virtual ~**StlQueue** ()
- **Iterator**< T > * **iterator** ()

  *Gets an **Iterator** (p. 1832) over this **Queue** (p. 2671).*

- void **clear** ()

  Empties this queue.

- T & **front** ()

  Returns a Reference to the element at the head of the queue.

- const T & **front** () const

  Returns a Reference to the element at the head of the queue.

- T & **back** ()

  Returns a Reference to the element at the tail of the queue.

- const T & **back** () const

  Returns a Reference to the element at the tail of the queue.

- void **push** (const T &t)

  Places a new Object at the Tail of the queue.

- void **enqueueFront** (const T &t)

  Places a new Object at the front of the queue.

- T **pop** ()

  Removes and returns the element that is at the Head of the queue.

- size_t **size** () const

  *Gets the Number of elements currently in the **Queue** (p. 2671).*

- bool **empty** () const

  *Checks if this **Queue** (p. 2671) is currently empty.*

- virtual std::vector< T > **toArray** () const
- void **reverse** (**StlQueue**< T > &target) const

  Reverses the order of the contents of this queue and stores them in the target queue.

- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)

  Locks the object.

- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)

  Unlocks the object.

- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals the waiters on this object that it can now wake up and continue.

- T & **getSafeValue** ()

  Fetch a reference to the safe value this object will return when there is nothing to fetch from the queue.

6.648.1 Detailed Description

template<typename T> class decaf::util::StlQueue< T >

The **Queue** (p. 2671) class accepts messages with an psuh(m) command where m is the message to be queued. It destructively returns the message with **pop()** (p. 3047). **pop()** (p. 3047) returns messages in the order they were enqueued.

Queue (p. 2671) is implemented with an instance of the STL queue object. The interface is essentially the same as that of the STL queue except that the pop method actually reaturns a reference to the element popped. This frees the app from having to call the `front` method before calling pop.

Queue<string> sq; // make a queue to hold string messages sq.push(s); // enqueues a message m string s = sq.pop(); // dequeues a message

= DESIGN CONSIDERATIONS

The **Queue** (p. 2671) class inherits from the Synchronizable interface and provides methods for locking and unlocking this queue as well as waiting on this queue. In a multi-threaded app this can allow for multiple threads to be reading from and writing to the same **Queue** (p. 2671).

Clients should consider that in a multiple threaded app it is possible that items could be placed on the queue faster than you are taking them off, so protection should be placed in your polling loop to ensure that you don't get stuck there.

6.648.2 Constructor & Destructor Documentation

6.648.2.1 template<typename T> decaf::util::StlQueue< T >::StlQueue () [inline]

6.648.2.2 template<typename T> virtual decaf::util::StlQueue< T >::~StlQueue () [inline, virtual]

6.648.3 Member Function Documentation

6.648.3.1 template<typename T> const T& decaf::util::StlQueue< T >::back () const [inline]

Returns a Reference to the element at the tail of the queue.

Returns:

reference to a queue type object or (safe)

6.648.3.2 template<typename T> T& decaf::util::StlQueue< T >::back () [inline]

Returns a Reference to the element at the tail of the queue.

Returns:

reference to a queue type object or (safe)

6.648.3.3 template<typename T> void decaf::util::StlQueue< T >::clear () [inline]

Empties this queue.

6.648.3.4 template<typename T> bool decaf::util::StlQueue< T >::empty () const [inline]

Checks if this **Queue** (p. 2671) is currently empty.

Returns:

boolean indicating queue emptiness

6.648.3.5 template<typename T> void decaf::util::StlQueue< T >::enqueueFront (const T & *t*) [inline]

Places a new Object at the front of the queue.

Parameters:

t **- Queue** (p. 2671) Object Type reference.

6.648.3.6 template<typename T> const T& decaf::util::StlQueue< T >::front () const [inline]

Returns a Reference to the element at the head of the queue.

Returns:

reference to a queue type object or (safe)

6.648.3.7 template<typename T> T& decaf::util::StlQueue< T >::front () [inline]

Returns a Reference to the element at the head of the queue.

Returns:

reference to a queue type object or (safe)

6.648.3.8 template<typename T> T& decaf::util::StlQueue< T >::getSafeValue () [inline]

Fetch a reference to the safe value this object will return when there is nothing to fetch from the queue.

Returns:

Reference to this Queues safe object

Referenced by decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::back(), decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::front(), and decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::pop().

6.648.3.9 template<typename T> Iterator<T>* decaf::util::StlQueue< T >::iterator () [inline]

Gets an **Iterator** (p. 1832) over this **Queue** (p. 2671).

Returns:

new iterator pointer that is owned by the caller.

6.648.3.10 template<typename T> virtual void decaf::util::StlQueue< T >::lock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3123).

6.648.3.11 template<typename T> virtual void decaf::util::StlQueue< T >::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3124).

6.648.3.12 template<typename T> virtual void decaf::util::StlQueue< T >::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3125).

6.648.3.13 template<typename T> T decaf::util::StlQueue< T >::pop () [inline]

Removes and returns the element that is at the Head of the queue.

Returns:

reference to a queue type object or (safe)

6.648.3.14 template<typename T> void decaf::util::StlQueue< T >::push (const T & *t*) [inline]

Places a new Object at the Tail of the queue.

Parameters:

t - **Queue** (p. 2671) Object Type reference.

6.648.3.15 template<typename T> void decaf::util::StlQueue< T >::reverse (StlQueue< T > & *target*) const [inline]

Reverses the order of the contents of this queue and stores them in the target queue.

Parameters:

target - The target queue that will receive the contents of this queue in reverse order.

6.648.3.16 template<typename T> size_t decaf::util::StlQueue< T >::size () const [inline]

Gets the Number of elements currently in the **Queue** (p. 2671).

Returns:

Queue (p. 2671) Size

6.648.3.17 template<typename T> virtual std::vector<T> decaf::util::StlQueue< T >::toArray () const [inline, virtual]

Returns:

the all values in this queue as a std::vector.

6.648.3.18 template<typename T> virtual bool decaf::util::StlQueue< T >::tryLock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3126).

6.648.3.19 template<typename T> virtual void decaf::util::StlQueue< T >::unlock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3127).

6.648.3.20 template<typename T> virtual void decaf::util::StlQueue< T >::wait (long long *millisecs*, int *nanos*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3128).

6.648.3.21 template<typename T> virtual void decaf::util::StlQueue< T >::wait (long long *millisecs*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3130).

6.648.3.22 template<typename T> virtual void decaf::util::StlQueue< T >::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3131).

6.649 decaf::util::StlSet< E > Class Template Reference

Set (p. 2905) template that wraps around a std::set to provide a more user-friendly interface and to provide common functions that do not exist in std::set.

`#include <src/main/decaf/util/StlSet.h>`Inheritance diagram for decaf::util::StlSet< E >:

Data Structures

- class **ConstSetIterator**
- class **SetIterator**

Public Member Functions

- **StlSet** ()

  Default constructor - does nothing.

- **StlSet** (const **StlSet** &source)

  Copy constructor - copies the content of the given set into this one.

- **StlSet** (const **Collection**< E > &source)

  Copy constructor - copies the content of the given set into this one.

- virtual ~**StlSet** ()
- **Iterator**< E > * **iterator** ()

  Returns:

  an iterator over a set of elements of type T.

- **Iterator**< E > * **iterator** () const
- virtual bool **equals** (const **StlSet** &source) const

- virtual void **copy** (const **StlSet** &source)

- virtual void **clear** () throw (lang::exceptions::UnsupportedOperationException)

  Removes all of the elements from this collection (optional operation).
  The collection will be empty after this method returns.
  *This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1833) operation. Most implementations will probably choose to override this method for efficiency.*
  Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

  Exceptions:

  UnsupportedOperationException *if the clear operation is not supported by this collection*

- virtual bool **contains** (const E &value) const throw (lang::Exception)

Returns true if this collection contains the specified element.
This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Parameters:

value *- the value whose presence is to be queried for in this* ***Collection*** *(*p. *1054).*

Returns:

true if the value is contained in this collection

Exceptions:

Exception *if an error occurs,*

- virtual bool **isEmpty** () const
- virtual std::size_t **size** () const
- virtual bool **add** (const E &value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException)

  Returns true if this collection changed as a result of the call.
  (Returns false if this collection does not permit duplicates and already contains the specified element.)
  Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. ***Collection*** *(*p. *1054) classes should clearly specify in their documentation any restrictions on what elements may be added.*
  If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.
  For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

  Parameters:

  value *- reference to the element to add.*

  Returns:

  true if the element was added

  Exceptions:

  UnsupportedOperationException
  IllegalArgumentException
  IllegalStateException *if the element cannot be added at this time due to insertion restrictions*

- virtual bool **remove** (const E &value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)

  Removes a single instance of the specified element from this collection, if it is present (optional operation).
  More formally, removes the first element e such that e == o, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).
  This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.
  Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

  Parameters:

  value *- element to be removed from this collection, if present*

  Returns:

  true if an element was removed as a result of this call

Exceptions:

UnsupportedOperationException *if the remove operation is not supported by this collection.*
IllegalArgumentException *If the value is not a valid entry for this* ***Collection*** *(p. 1054).*

6.649.1 Detailed Description

template<typename E> class decaf::util::StlSet< E >

Set (p. 2905) template that wraps around a std::set to provide a more user-friendly interface and to provide common functions that do not exist in std::set.

6.649.2 Constructor & Destructor Documentation

6.649.2.1 template<typename E> decaf::util::StlSet< E >::StlSet () [inline]

Default constructor - does nothing.

6.649.2.2 template<typename E> decaf::util::StlSet< E >::StlSet (const StlSet< E > & *source*) [inline]

Copy constructor - copies the content of the given set into this one.

Parameters:

source The source set.

6.649.2.3 template<typename E> decaf::util::StlSet< E >::StlSet (const Collection< E > & *source*) [inline]

Copy constructor - copies the content of the given set into this one.

Parameters:

source The source set.

6.649.2.4 template<typename E> virtual decaf::util::StlSet< E >::~StlSet () [inline, virtual]

6.649.3 Member Function Documentation

6.649.3.1 template<typename E> virtual bool decaf::util::StlSet< E >::add (const E & *value*) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException) [inline, virtual]

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 1054) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters:

value - reference to the element to add.

Returns:

true if the element was added

Exceptions:

UnsupportedOperationException

IllegalArgumentException

IllegalStateException if the element cannot be added at this time due to insertion restrictions

Implements **decaf::util::Collection< E >** (p. 1056).

6.649.3.2 template<typename E> virtual void decaf::util::StlSet< E >::clear () throw (lang::exceptions::UnsupportedOperationException) [inline, virtual]

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1833) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions:

UnsupportedOperationException if the clear operation is not supported by this collection

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 151).

6.649.3.3 template<typename E> virtual bool decaf::util::StlSet< E >::contains (const E & *value*) const throw (lang::Exception) [inline, virtual]

Returns true if this collection contains the specified element.

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Parameters:

value - the value whose presence is to be queried for in this **Collection** (p. 1054).

Returns:

true if the value is contained in this collection

Exceptions:

Exception if an error occurs,

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 152).

6.649.3.4 template<typename E> virtual void decaf::util::StlSet< E >::copy (const StlSet< E > & *source*) [inline, virtual]

Referenced by decaf::util::StlSet< ActiveMQSession * >::StlSet().

6.649.3.5 template<typename E> virtual bool decaf::util::StlSet< E >::equals (const StlSet< E > & *source*) const [inline, virtual]

6.649.3.6 template<typename E> virtual bool decaf::util::StlSet< E >::isEmpty () const [inline, virtual]

Returns:

if the set contains any element or not, TRUE or FALSE

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 153).

6.649.3.7 template<typename E> Iterator<E>* decaf::util::StlSet< E >::iterator () const [inline, virtual]

Implements **decaf::lang::Iterable< E >** (p. 1830).

6.649.3.8 template<typename E> Iterator<E>* decaf::util::StlSet< E >::iterator () [inline, virtual]

Returns:

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< E >** (p. 1830).

6.649.3.9 template<typename E> virtual bool decaf::util::StlSet< E >::remove (const E & *value*) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException) [inline, virtual]

Removes a single instance of the specified element from this collection, if it is present (optional operation).

More formally, removes the first element e such that e == o, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Parameters:

value - element to be removed from this collection, if present

Returns:

true if an element was removed as a result of this call

Exceptions:

UnsupportedOperationException if the remove operation is not supported by this collection.

IllegalArgumentException If the value is not a valid entry for this **Collection** (p. 1054).

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 155).

6.649.3.10 template<typename E> virtual std::size_t decaf::util::StlSet< E >::size () const [inline, virtual]

Returns:

The number of elements in this set.

Implements **decaf::util::Collection< E >** (p. 1062).

6.651 activemq::wireformat::stomp::StompFrame Class Reference

A Stomp-level message frame that encloses all messages to and from the broker.

`#include <src/main/activemq/wireformat/stomp/StompFrame.h>`

Public Member Functions

- **StompFrame** ()
  Default constructor.
- virtual ~**StompFrame** ()
  Destruction.
- **StompFrame** * **clone** () const
  Clonse this message exactly, returns a new instance that the caller is required to delete.
- void **copy** (const **StompFrame** *src)
  Copies the contents of the passed Frame to this one.
- void **setCommand** (const std::string &cmd)
  Sets the command for this stomp frame.
- const std::string & **getCommand** () const
  Accessor for this frame's command field.
- bool **hasProperty** (const std::string &name) const
  Checks if the given property is present in the Frame.
- std::string **getProperty** (const std::string &name, const std::string &fallback="") const
  Gets a property from this Frame's properties and returns it, or the default value given.
- std::string **removeProperty** (const std::string &name)
  Gets and remove the property specified, if the property is not set, this method returns the empty string.
- void **setProperty** (const std::string &name, const std::string &value)
  Sets the property given to the value specified in this Frame's Properties.
- **decaf::util::Properties** & **getProperties** ()
  Gets access to the header properties for this frame.
- const **decaf::util::Properties** & **getProperties** () const
- const std::vector< unsigned char > & **getBody** () const
  Accessor for the body data of this frame.
- std::vector< unsigned char > & **getBody** ()
  Non-const version of the body accessor.

- std::size_t **getBodyLength** () const

  Return the number of bytes contained in this frames body.

- void **setBody** (const unsigned char *bytes, std::size_t numBytes)

  Sets the body data of this frame as a byte sequence.

- void **toStream** (**decaf::io::DataOutputStream** *stream) const throw (decaf::io::IOException)

  Writes this Frame to an OuputStream in the Stomp Wire Format.

- void **fromStream** (**decaf::io::DataInputStream** *stream) throw (decaf::io::IOException)

  Reads a Stop Frame from a DataInputStream in the Stomp Wire format.

6.651.1 Detailed Description

A Stomp-level message frame that encloses all messages to and from the broker.

6.651.2 Constructor & Destructor Documentation

6.651.2.1 activemq::wireformat::stomp::StompFrame::StompFrame () [inline]

Default constructor.

6.651.2.2 virtual activemq::wireformat::stomp::StompFrame::~StompFrame () [inline, virtual]

Destruction.

6.651.3 Member Function Documentation

6.651.3.1 StompFrame* activemq::wireformat::stomp::StompFrame::clone () const

Clonse this message exactly, returns a new instance that the caller is required to delete.

Returns:

new copy of this message

6.651.3.2 void activemq::wireformat::stomp::StompFrame::copy (const StompFrame * *src*)

Copies the contents of the passed Frame to this one.

Parameters:

src - Frame to copy

6.651.3.3 void activemq::wireformat::stomp::StompFrame::fromStream (decaf::io::DataInputStream * *stream*) throw (decaf::io::IOException)

Reads a Stop Frame from a DataInputStream in the Stomp Wire format.

Parameters:

stream - The stream to read the Frame from.

Exceptions:

IOException if an error occurs while writing the Frame.

6.651.3.4 std::vector<unsigned char>& activemq::wireformat::stomp::StompFrame::getBody () [inline]

Non-const version of the body accessor.

6.651.3.5 const std::vector<unsigned char>& activemq::wireformat::stomp::StompFrame::getBody () const [inline]

Accessor for the body data of this frame.

Returns:

char pointer to body data

6.651.3.6 std::size_t activemq::wireformat::stomp::StompFrame::getBodyLength () const [inline]

Return the number of bytes contained in this frames body.

Returns:

Body bytes length.

6.651.3.7 const std::string& activemq::wireformat::stomp::StompFrame::getCommand () const [inline]

Accessor for this frame's command field.

6.651.3.8 const decaf::util::Properties& activemq::wireformat::stomp::StompFrame::getProperties () const [inline]

6.651.3.9 decaf::util::Properties& activemq::wireformat::stomp::StompFrame::getProperties () [inline]

Gets access to the header properties for this frame.

Returns:

the Properties object owned by this Frame

6.651.3.10 std::string activemq::wireformat::stomp::StompFrame::getProperty (const std::string & *name*, const std::string & *fallback* = "") const [inline]

Gets a property from this Frame's properties and returns it, or the default value given.

Parameters:

name - The name of the property to lookup

fallback - The default value to return if this value isn't set

Returns:

string value of the property asked for.

6.651.3.11 bool activemq::wireformat::stomp::StompFrame::hasProperty (const std::string & *name*) const [inline]

Checks if the given property is present in the Frame.

Parameters:

name - The name of the property to check for.

6.651.3.12 std::string activemq::wireformat::stomp::StompFrame::removeProperty (const std::string & *name*) [inline]

Gets and remove the property specified, if the property is not set, this method returns the empty string.

Parameters:

name - the Name of the property to get and return.

6.651.3.13 void activemq::wireformat::stomp::StompFrame::setBody (const unsigned char * *bytes*, std::size_t *numBytes*)

Sets the body data of this frame as a byte sequence.

Parameters:

bytes The byte buffer to be set in the body.

numBytes The number of bytes in the buffer.

6.651.3.14 void activemq::wireformat::stomp::StompFrame::setCommand (const std::string & *cmd*) [inline]

Sets the command for this stomp frame.

Parameters:

cmd command The command to be set.

6.651.3.15 void activemq::wireformat::stomp::StompFrame::setProperty (const std::string & *name*, const std::string & *value*) [inline]

Sets the property given to the value specified in this Frame's Properties.

Parameters:

name - Name of the property.

value - Value to set the property to.

6.651.3.16 void activemq::wireformat::stomp::StompFrame::toStream (decaf::io::DataOutputStream * *stream*) const throw (decaf::io::IOException)

Writes this Frame to an OuputStream in the Stomp Wire Format.

Parameters:

stream - The stream to write the Frame to.

Exceptions:

IOException if an error occurs while reading the Frame.

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/stomp/**StompFrame.h**

6.652 activemq::wireformat::stomp::StompHelper Class Reference

Utility Methods used when marshaling to and from StompFrame's.

`#include <src/main/activemq/wireformat/stomp/StompHelper.h>`

Public Member Functions

- **StompHelper** ()
- virtual ~**StompHelper** ()
- void **convertProperties** (const **Pointer**< **StompFrame** > &frame, const **Pointer**< **Message** > &message)

  Converts the Headers in a Stomp Frame into Headers in the given Message Command.

- void **convertProperties** (const **Pointer**< **Message** > &message, const **Pointer**< **StompFrame** > &frame)

  Converts the Properties in a Message Command to Valid Headers and Properties in the ***StompFrame*** *(p. 3061).*

- **Pointer**< **ActiveMQDestination** > **convertDestination** (const std::string &destination)

  Converts from a Stomp Destination to an ActiveMQDestination.

- std::string **convertDestination** (const **Pointer**< **ActiveMQDestination** > &destination)

  Converts from a ActiveMQDestination to a Stomp Destination Name.

- std::string **convertMessageId** (const **Pointer**< **MessageId** > &messageId)

  Converts a MessageId instance to a Stomp MessageId String.

- **Pointer**< **MessageId** > **convertMessageId** (const std::string &messageId)

  Converts a Stomp MessageId string to a MessageId.

- std::string **convertConsumerId** (const **Pointer**< **ConsumerId** > &consumerId)

  Converts a ConsumerId instance to a Stomp ConsumerId String.

- **Pointer**< **ConsumerId** > **convertConsumerId** (const std::string &consumerId)

  Converts a Stomp ConsumerId string to a ConsumerId.

- std::string **convertProducerId** (const **Pointer**< **ProducerId** > &producerId)

  Converts a ProducerId instance to a Stomp ProducerId String.

- **Pointer**< **ProducerId** > **convertProducerId** (const std::string &producerId)

  Converts a Stomp ProducerId string to a ProducerId.

- std::string **convertTransactionId** (const **Pointer**< **TransactionId** > &transactionId)

  Converts a TransactionId instance to a Stomp TransactionId String.

- **Pointer**< **TransactionId** > **convertTransactionId** (const std::string &transactionId)

  Converts a Stomp TransactionId string to a TransactionId.

6.652.1 Detailed Description

Utility Methods used when marshaling to and from StompFrame's.

Since:

3.0

6.652.2 Constructor & Destructor Documentation

6.652.2.1 activemq::wireformat::stomp::StompHelper::StompHelper () [inline]

6.652.2.2 virtual activemq::wireformat::stomp::StompHelper::~StompHelper () [inline, virtual]

6.652.3 Member Function Documentation

6.652.3.1 Pointer<ConsumerId> activemq::wireformat::stomp::StompHelper::convertConsumerId (const std::string & *consumerId*)

Converts a Stomp ConsumerId string to a ConsumerId.

Parameters:

consumerId - the String Consumer Id to convert.

Returns:

Pointer to a new ConsumerId.

6.652.3.2 std::string activemq::wireformat::stomp::StompHelper::convertConsumerId (const Pointer< ConsumerId > & *consumerId*)

Converts a ConsumerId instance to a Stomp ConsumerId String.

Parameters:

consumerId - the Consumer instance to convert.

Returns:

a Stomp Consumer Id String.

6.652.3.3 std::string activemq::wireformat::stomp::StompHelper::convertDestination (const Pointer< ActiveMQDestination > & *destination*)

Converts from a ActiveMQDestination to a Stomp Destination Name.

Parameters:

destination - The ActiveMQDestination to Convert

Returns:

the Stomp String name that defines the destination.

6.652.3.4 Pointer<ActiveMQDestination> activemq::wireformat::stomp::StompHelper::convertDestination (const std::string & *destination*)

Converts from a Stomp Destination to an ActiveMQDestination.

Parameters:

destination - The Stomp Destination name string.

Returns:

Pointer to a new ActiveMQDestination.

6.652.3.5 Pointer<MessageId> activemq::wireformat::stomp::StompHelper::convertMessageId (const std::string & *messageId*)

Converts a Stomp MessageId string to a MessageId.

Parameters:

messageId - the String message Id to convert.

Returns:

Pointer to a new MessageId.

6.652.3.6 std::string activemq::wireformat::stomp::StompHelper::convertMessageId (const Pointer< MessageId > & *messageId*)

Converts a MessageId instance to a Stomp MessageId String.

Parameters:

messageId - the MessageId instance to convert.

Returns:

a Stomp Message Id String.

6.652.3.7 Pointer<ProducerId> activemq::wireformat::stomp::StompHelper::convertProducerId (const std::string & *producerId*)

Converts a Stomp ProducerId string to a ProducerId.

Parameters:

producerId - the String Producer Id to convert.

Returns:

Pointer to a new ProducerId.

6.652.3.8 std::string activemq::wireformat::stomp::StompHelper::convertProducerId (const Pointer< ProducerId > & *producerId*)

Converts a ProducerId instance to a Stomp ProducerId String.

Parameters:

producerId - the Producer instance to convert.

Returns:

a Stomp Producer Id String.

6.652.3.9 void activemq::wireformat::stomp::StompHelper::convertProperties (const Pointer< Message > & *message*, const Pointer< StompFrame > & *frame*)

Converts the Properties in a Message Command to Valid Headers and Properties in the **StompFrame** (p. 3061).

Parameters:

message - The message to move the Headers to.

frame - The frame to extract headers from.

6.652.3.10 void activemq::wireformat::stomp::StompHelper::convertProperties (const Pointer< StompFrame > & *frame*, const Pointer< Message > & *message*)

Converts the Headers in a Stomp Frame into Headers in the given Message Command.

Parameters:

frame - The frame to extract headers from.

message - The message to move the Headers to.

6.652.3.11 Pointer<TransactionId> activemq::wireformat::stomp::StompHelper::convertTransactionId (const std::string & *transactionId*)

Converts a Stomp TransactionId string to a TransactionId.

Parameters:

transactionId - the String Transaction Id to convert.

Returns:

Pointer to a new TransactionId.

6.652.3.12 std::string activemq::wireformat::stomp::StompHelper::convertTransactionId (const Pointer< TransactionId > & *transactionId*)

Converts a TransactionId instance to a Stomp TransactionId String.

Parameters:

transactionId - the Transaction instance to convert.

Returns:

a Stomp Transaction Id String.

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/stomp/**StompHelper.h**

6.653 activemq::wireformat::stomp::StompWireFormat Class Reference

`#include <src/main/activemq/wireformat/stomp/StompWireFormat.h>`Inheritance diagram for activemq::wireformat::stomp::StompWireFormat:

Public Member Functions

- **StompWireFormat** ()
- virtual ~**StompWireFormat** ()
- virtual void **marshal** (const **Pointer**< **commands::Command** > &command, const **activemq::transport::Transport** *transport, **decaf::io::DataOutputStream** *out) throw (decaf::io::IOException)

  Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

- virtual **Pointer**< **commands::Command** > **unmarshal** (const **activemq::transport::Transport** *transport, **decaf::io::DataInputStream** *in) throw (decaf::io::IOException)

  Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.

- virtual void **setVersion** (int version AMQCPP_UNUSED)

  Set the Version.

- virtual int **getVersion** () const

  Get the Version.

- virtual bool **inReceive** () const

  Is there a Message being unmarshaled?

- virtual bool **hasNegotiator** () const

  *Returns true if this **WireFormat** (p. 3363) has a Negotiator that needs to wrap the Transport that uses it.*

- virtual **Pointer**< **transport::Transport** > **createNegotiator** (const **Pointer**< **transport::Transport** > &transport) throw (decaf::lang::exceptions::UnsupportedOperationException)

  If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.

6.653.1 Constructor & Destructor Documentation

6.653.1.1 activemq::wireformat::stomp::StompWireFormat::StompWireFormat ()

6.653.1.2 virtual activemq::wireformat::stomp::StompWireFormat::~StompWireFormat () [virtual]

6.653.2 Member Function Documentation

6.653.2.1 virtual Pointer<transport::Transport> activemq::wireformat::stomp::StompWireFormat::createNegotiator (const Pointer< transport::Transport > & *transport*) throw (decaf::lang::exceptions::UnsupportedOperationException) [virtual]

If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.

Returns:

new instance of a **WireFormatNegotiator** (p. 3399).

Exceptions:

UnsupportedOperationException if the **WireFormat** (p. 3363) doesn't have a Negotiator.

Implements **activemq::wireformat::WireFormat** (p. 3364).

6.653.2.2 virtual int activemq::wireformat::stomp::StompWireFormat::getVersion () const [inline, virtual]

Get the Version.

Returns:

the version of the wire format

Implements **activemq::wireformat::WireFormat** (p. 3364).

6.653.2.3 virtual bool activemq::wireformat::stomp::StompWireFormat::hasNegotiator () const [inline, virtual]

Returns true if this **WireFormat** (p. 3363) has a Negotiator that needs to wrap the Transport that uses it.

Returns:

true if the **WireFormat** (p. 3363) provides a Negotiator.

Implements **activemq::wireformat::WireFormat** (p. 3364).

6.653.2.4 virtual bool activemq::wireformat::stomp::StompWireFormat::inReceive () const [inline, virtual]

Is there a Message being unmarshaled?

Returns:

true while in the doUnmarshal method.

Implements **activemq::wireformat::WireFormat** (p. 3365).

6.653.2.5 virtual void activemq::wireformat::stomp::StompWireFormat::marshal (const Pointer< commands::Command > & *command*, const activemq::transport::Transport * *transport*, decaf::io::DataOutputStream * *out*) throw (decaf::io::IOException) [virtual]

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

Parameters:

command The Command to Marshal to the output stream.

transport The Transport that initiated this marshal call.

out The output stream to write the command to.

Exceptions:

IOException

Implements **activemq::wireformat::WireFormat** (p. 3365).

6.653.2.6 virtual void activemq::wireformat::stomp::StompWireFormat::setVersion (int version *AMQCPP_UNUSED*) [inline, virtual]

Set the Version.

Parameters:

the version of the wire format

Implements **activemq::wireformat::WireFormat** (p. 3365).

6.653.2.7 virtual Pointer<commands::Command> activemq::wireformat::stomp::StompWireFormat::unmarshal (const activemq::transport::Transport * *transport*, decaf::io::DataInputStream * *in*) throw (decaf::io::IOException) [virtual]

Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form. Returns a Pointer to the newly unmarshaled Command.

Parameters:

transport - Pointer to the transport that is making this request.

in - the input stream to read the command from.

Returns:

the newly marshaled Command, caller owns the pointer

Exceptions:

IOException

Implements **activemq::wireformat::WireFormat** (p. 3366).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/stomp/**StompWireFormat.h**

6.654 activemq::wireformat::stomp::StompWireFormatFactory Class Reference

Factory used to create the Stomp Wire Format instance.

`#include <src/main/activemq/wireformat/stomp/StompWireFormatFactory.h>`Inheritance diagram for activemq::wireformat::stomp::StompWireFormatFactory:

Public Member Functions

- **StompWireFormatFactory** ()
- virtual ~**StompWireFormatFactory** ()
- virtual **Pointer< WireFormat >** **createWireFormat** (const **decaf::util::Properties** &properties) throw (decaf::lang::exceptions::IllegalStateException)

  *Creates a new **WireFormat** (p. 3363) Object passing it a set of properties from which it can obtain any optional settings.*

6.654.1 Detailed Description

Factory used to create the Stomp Wire Format instance.

6.654.2 Constructor & Destructor Documentation

6.654.2.1 activemq::wireformat::stomp::StompWireFormatFactory::StompWireFormatFactory () `[inline]`

6.654.2.2 virtual activemq::wireformat::stomp::StompWireFormatFactory::~StompWireFormatFactory () `[inline, virtual]`

6.654.3 Member Function Documentation

6.654.3.1 virtual Pointer<WireFormat> activemq::wireformat::stomp::StompWireFormatFactory::createWireFormat (const decaf::util::Properties & *properties*) throw (decaf::lang::exceptions::IllegalStateException) `[virtual]`

Creates a new **WireFormat** (p. 3363) Object passing it a set of properties from which it can obtain any optional settings.

Parameters:

properties - the Properties for this **WireFormat** (p. 3363)

Implements **activemq::wireformat::WireFormatFactory** (p. 3367).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/stomp/**StompWireFormatFactory.h**

6.655 cms::Stoppable Class Reference

Interface for a class that implements the stop method.

`#include <src/main/cms/Stoppable.h>`Inheritance diagram for cms::Stoppable:

Public Member Functions

- virtual ~**Stoppable** ()
- virtual void **stop** ()=0 throw (CMSException)

  Stops this service.

6.655.1 Detailed Description

Interface for a class that implements the stop method. An object that implements this interface implies that it will halt all operations that result in events being propagated to external users, internally the Object can continue to process data but not events will be generated to clients and methods that return data will not return valid results until the object is started again.

Since:

1.0

6.655.2 Constructor & Destructor Documentation

6.655.2.1 virtual cms::Stoppable::~Stoppable () [inline, virtual]

6.655.3 Member Function Documentation

6.655.3.1 virtual void cms::Stoppable::stop () throw (CMSException) [pure virtual]

Stops this service.

Exceptions:

CMSException *(*p. ***1031)*** - if an internal error occurs while stopping the Service.

Implemented in **activemq::core::ActiveMQConnection** (p. 242).

The documentation for this class was generated from the following file:

- src/main/cms/**Stoppable.h**

6.656 decaf::util::logging::StreamHandler Class Reference

`#include <src/main/decaf/util/logging/StreamHandler.h>`Inheritance diagram for decaf::util::logging::StreamHandler:

Public Member Functions

- **StreamHandler** ()

  *Create a **StreamHandler** (p. 3077), with no current output stream.*

- **StreamHandler** (**io::OutputStream** *stream, **Formatter** *formatter)

  *Create a **StreamHandler** (p. 3077), with no current output stream.*

- virtual ~**StreamHandler** ()
- virtual void **close** () throw (decaf::io::IOException)

  Close the current output stream.

- virtual void **flush** ()

  Flush the Handler's output, clears any buffers.

- virtual void **publish** (const **LogRecord** &record)

  *Publish the Log Record to this **Handler** (p. 1709).*

- virtual void **isLoggable** (const **LogRecord** &record)

  *Check if this **Handler** (p. 1709) would actually log a given **LogRecord** (p. 2050).*

- virtual void **setFilter** (const **Filter** *filter)

  *Sets the **Filter** (p. 1630) that this **Handler** (p. 1709) uses to filter Log Records.*

- virtual const **Filter** * **getFilter** ()

  *Gets the **Filter** (p. 1630) that this **Handler** (p. 1709) uses to filter Log Records.*

- virtual void **setLevel** (**Level** level)

  ***Set** (p. 2905) the log level specifying which message levels will be logged by this **Handler** (p. 1709).*

- virtual **Level** **getLevel** ()

  *Get the log level specifying which message levels will be logged by this **Handler** (p. 1709).*

- virtual void **setFormatter** (const **Formatter** *formatter)

  *Sets the `Formatter` (p. 1699) used by this **Handler** (p. 1709).*

- virtual const **Formatter** * **getFormatter** ()

  *Gets the `Formatter` (p. 1699) used by this **Handler** (p. 1709).*

- virtual **io::OutputStream** * **getOutputStream** () const

  *Gets the output Stream that this **Handler** (p. 1709) is using.*

6.656.1 Constructor & Destructor Documentation

6.656.1.1 decaf::util::logging::StreamHandler::StreamHandler () [inline]

Create a **StreamHandler** (p. 3077), with no current output stream.

6.656.1.2 decaf::util::logging::StreamHandler::StreamHandler (io::OutputStream * *stream*, Formatter * *formatter*) [inline]

Create a **StreamHandler** (p. 3077), with no current output stream.

References decaf::util::logging::Fatal.

6.656.1.3 virtual decaf::util::logging::StreamHandler::~StreamHandler () [inline, virtual]

References DECAF_CATCH_NOTHROW, and DECAF_CATCHALL_NOTHROW.

6.656.2 Member Function Documentation

6.656.2.1 virtual void decaf::util::logging::StreamHandler::close () throw (decaf::io::IOException) [inline, virtual]

Close the current output stream. The close method will perform a flush and then close the **Handler** (p. 1709). After close has been called this **Handler** (p. 1709) should no longer be used. Method calls may either be silently ignored or may throw runtime exceptions.

Exceptions:

IOException

Implements **decaf::io::Closeable** (p. 1019).

6.656.2.2 virtual void decaf::util::logging::StreamHandler::flush () [inline, virtual]

Flush the Handler's output, clears any buffers.

Implements **decaf::util::logging::Handler** (p. 1710).

6.656.2.3 virtual const Filter* decaf::util::logging::StreamHandler::getFilter () [inline, virtual]

Gets the **Filter** (p. 1630) that this **Handler** (p. 1709) uses to filter Log Records.

Returns:

`Filter` (p. 1630) derived instance

Implements **decaf::util::logging::Handler** (p. 1710).

6.656.2.4 virtual const Formatter* decaf::util::logging::StreamHandler::getFormatter () [inline, virtual]

Gets the `Formatter` (p. 1699) used by this **Handler** (p. 1709).

Returns:

currently configured `Formatter` (p. 1699) derived instance

Implements **decaf::util::logging::Handler** (p. 1710).

6.656.2.5 virtual Level decaf::util::logging::StreamHandler::getLevel () [inline, virtual]

Get the log level specifying which message levels will be logged by this **Handler** (p. 1709).

Returns:

Currently set Level enumeration value

Implements **decaf::util::logging::Handler** (p. 1710).

6.656.2.6 virtual io::OutputStream* decaf::util::logging::StreamHandler::getOutputStream () const [inline, virtual]

Gets the output Stream that this **Handler** (p. 1709) is using.

Returns:

OuputStream pointer used by this handler.

6.656.2.7 virtual void decaf::util::logging::StreamHandler::isLoggable (const LogRecord & *record*) [inline, virtual]

Check if this **Handler** (p. 1709) would actually log a given **LogRecord** (p. 2050).

Parameters:

record `LogRecord` (p. 2050) to check

Implements **decaf::util::logging::Handler** (p. 1710).

6.656.2.8 virtual void decaf::util::logging::StreamHandler::publish (const LogRecord & *record*) [inline, virtual]

Publish the Log Record to this **Handler** (p. 1709).

Parameters:

record The `LogRecord` (p. 2050) to Publish

Implements **decaf::util::logging::Handler** (p. 1711).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.656.2.9 virtual void decaf::util::logging::StreamHandler::setFilter (const Filter * *filter*) [inline, virtual]

Sets the **Filter** (p. 1630) that this **Handler** (p. 1709) uses to filter Log Records.

Parameters:

filter `Filter` (p. 1630) derived instance

Implements **decaf::util::logging::Handler** (p. 1711).

6.656.2.10 virtual void decaf::util::logging::StreamHandler::setFormatter (const Formatter * *formatter*) [inline, virtual]

Sets the `Formatter` (p. 1699) used by this **Handler** (p. 1709).

Parameters:

formatter `Formatter` (p. 1699) derived instance

Implements **decaf::util::logging::Handler** (p. 1711).

6.656.2.11 virtual void decaf::util::logging::StreamHandler::setLevel (Level *level*) [inline, virtual]

Set (p. 2905) the log level specifying which message levels will be logged by this **Handler** (p. 1709). The intention is to allow developers to turn on verbose logging, but to limit the messages that are sent to certain Handlers.

Parameters:

level Level enumeration value

Implements **decaf::util::logging::Handler** (p. 1711).

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**StreamHandler.h**

6.657 cms::StreamMessage Class Reference

Interface for a **StreamMessage** (p. 3081).

`#include <src/main/cms/StreamMessage.h>`Inheritance diagram for cms::StreamMessage:

Public Member Functions

- virtual ~**StreamMessage** ()
- virtual bool **readBoolean** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException)

  Reads a Boolean from the Stream message stream.

- virtual void **writeBoolean** (bool value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Writes a boolean to the Stream message stream as a 1-byte value.

- virtual unsigned char **readByte** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException)

  Reads a Byte from the Stream message stream.

- virtual void **writeByte** (unsigned char value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Writes a byte to the Stream message stream as a 1-byte value.

- virtual std::size_t **readBytes** (std::vector< unsigned char > &value) const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException)

  Reads a byte array from the Stream message stream.

- virtual void **writeBytes** (const std::vector< unsigned char > &value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Writes a byte array to the Stream message stream using the vector size as the number of bytes to write.

- virtual std::size_t **readBytes** (unsigned char *buffer, std::size_t length) const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException)

  Reads a portion of the Stream message stream.

- virtual void **writeBytes** (const unsigned char *value, std::size_t offset, std::size_t length)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Writes a portion of a byte array to the Stream message stream.

- virtual char **readChar** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException)

Reads a Char from the Stream message stream.

- virtual void **writeChar** (char value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Writes a char to the Stream message stream as a 1-byte value.

- virtual float **readFloat** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException)

  Reads a 32 bit float from the Stream message stream.

- virtual void **writeFloat** (float value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Writes a float to the Stream message stream as a 4 byte value.

- virtual double **readDouble** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException)

  Reads a 64 bit double from the Stream message stream.

- virtual void **writeDouble** (double value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Writes a double to the Stream message stream as a 8 byte value.

- virtual short **readShort** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException)

  Reads a 16 bit signed short from the Stream message stream.

- virtual void **writeShort** (short value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Writes a signed short to the Stream message stream as a 2 byte value.

- virtual unsigned short **readUnsignedShort** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException)

  Reads a 16 bit unsigned short from the Stream message stream.

- virtual void **writeUnsignedShort** (unsigned short value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Writes a unsigned short to the Stream message stream as a 2 byte value.

- virtual int **readInt** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException)

  Reads a 32 bit signed integer from the Stream message stream.

- virtual void **writeInt** (int value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Writes a signed int to the Stream message stream as a 4 byte value.

- virtual long long **readLong** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException)

  Reads a 64 bit long from the Stream message stream.

- virtual void **writeLong** (long long value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Writes a long long to the Stream message stream as a 8 byte value.

- virtual std::string **readString** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException)

  Reads an ASCII String from the Stream message stream.

- virtual void **writeString** (const std::string &value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Writes an ASCII String to the Stream message stream.

6.657.1 Detailed Description

Interface for a **StreamMessage** (p. 3081). The stream Messages provides a **Message** (p. 2163) type whose body is a stream of self describing primitive types. The primitive values are read and written using accessors specific to the given types.

StreamMessage (p. 3081) objects support the following conversion table. The marked cases must be supported. The unmarked cases must throw a **CMSException** (p. 1031). The string-to-primitive conversions may throw a runtime exception if the primitive's valueOf() method does not accept it as a valid String representation of the primitive.

A value written as the row type can be read as the column type.

	boolean	byte	short	char	int	long	float	double	String	byte[]
boolean	X								X	
byte		X	X		X	X			X	
short			X		X	X			X	
char				X					X	
int					X	X			X	
long						X			X	
float							X	X	X	
double								X	X	
String	X	X	X		X	X	X	X	X	
byte[]										X

1.3

6.657.2 Constructor & Destructor Documentation

6.657.2.1 virtual cms::StreamMessage::~StreamMessage () [inline, virtual]

6.657.3 Member Function Documentation

6.657.3.1 virtual bool cms::StreamMessage::readBoolean () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]

Reads a Boolean from the Stream message stream.

Returns:

boolean value from stream

Exceptions:

CMSException (p. ***1031***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2277***) - if unexpected end of message stream has been reached.

MessageFormatException (p. ***2278***) - if this type conversion is invalid.

MessageNotReadableException (p. ***2330***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 468).

6.657.3.2 virtual unsigned char cms::StreamMessage::readByte () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]

Reads a Byte from the Stream message stream.

Returns:

unsigned char value from stream

Exceptions:

CMSException (p. ***1031***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2277***) - if unexpected end of message stream has been reached.

MessageFormatException (p. ***2278***) - if this type conversion is invalid.

MessageNotReadableException (p. ***2330***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 469).

6.657.3.3 virtual std::size_t cms::StreamMessage::readBytes (unsigned char * *buffer*, std::size_t *length*) const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]

Reads a portion of the Stream message stream. If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

If length is negative, or length is greater than the length of the array value, then an **CMSException** (p. 1031) is thrown. No bytes will be read from the stream for this exception case.

Parameters:

buffer the buffer into which the data is read

length the number of bytes to read; must be less than or equal to value.length

Returns:

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions:

CMSException *(*p. *1031)* - if the CMS provider fails to read the message due to some internal error.

MessageEOFException *(*p. *2277)* - if unexpected end of message stream has been reached.

MessageFormatException *(*p. *2278)* - if this type conversion is invalid.

MessageNotReadableException *(*p. *2330)* - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 469).

6.657.3.4 virtual std::size_t cms::StreamMessage::readBytes (std::vector< unsigned char > & *value*) const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]

Reads a byte array from the Stream message stream. If the length of vector value is less than the number of bytes remaining to be read from the stream, the vector should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of vector value, the bytes should be read into the vector. The return value of the total number of bytes read will be less than the length of the vector, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

Parameters:

value buffer to place data in

Returns:

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions:

CMSException (p. ***1031***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2277***) - if unexpected end of message stream has been reached.

MessageFormatException (p. ***2278***) - if this type conversion is invalid.

MessageNotReadableException (p. ***2330***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 470).

6.657.3.5 virtual char cms::StreamMessage::readChar () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]

Reads a Char from the Stream message stream.

Returns:

char value from stream

Exceptions:

CMSException (p. ***1031***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2277***) - if unexpected end of message stream has been reached.

MessageFormatException (p. ***2278***) - if this type conversion is invalid.

MessageNotReadableException (p. ***2330***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 470).

6.657.3.6 virtual double cms::StreamMessage::readDouble () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]

Reads a 64 bit double from the Stream message stream.

Returns:

double value from stream

Exceptions:

CMSException (p. ***1031***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException *(*p. *2277)* - if unexpected end of message stream has been reached.

MessageFormatException *(*p. *2278)* - if this type conversion is invalid.

MessageNotReadableException *(*p. *2330)* - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 471).

6.657.3.7 virtual float cms::StreamMessage::readFloat () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]

Reads a 32 bit float from the Stream message stream.

Returns:

double value from stream

Exceptions:

CMSException *(*p. *1031)* - if the CMS provider fails to read the message due to some internal error.

MessageEOFException *(*p. *2277)* - if unexpected end of message stream has been reached.

MessageFormatException *(*p. *2278)* - if this type conversion is invalid.

MessageNotReadableException *(*p. *2330)* - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 471).

6.657.3.8 virtual int cms::StreamMessage::readInt () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]

Reads a 32 bit signed integer from the Stream message stream.

Returns:

int value from stream

Exceptions:

CMSException *(*p. *1031)* - if the CMS provider fails to read the message due to some internal error.

MessageEOFException *(*p. *2277)* - if unexpected end of message stream has been reached.

MessageFormatException *(*p. *2278)* - if this type conversion is invalid.

MessageNotReadableException *(*p. *2330)* - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 472).

6.657.3.9 virtual long long cms::StreamMessage::readLong () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]

Reads a 64 bit long from the Stream message stream.

Returns:

long long value from stream

Exceptions:

CMSException (p. ***1031***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2277***) - if unexpected end of message stream has been reached.

MessageFormatException (p. ***2278***) - if this type conversion is invalid.

MessageNotReadableException (p. ***2330***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 472).

6.657.3.10 virtual short cms::StreamMessage::readShort () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]

Reads a 16 bit signed short from the Stream message stream.

Returns:

short value from stream

Exceptions:

CMSException (p. ***1031***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2277***) - if unexpected end of message stream has been reached.

MessageFormatException (p. ***2278***) - if this type conversion is invalid.

MessageNotReadableException (p. ***2330***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 472).

6.657.3.11 virtual std::string cms::StreamMessage::readString () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]

Reads an ASCII String from the Stream message stream.

Returns:

String from stream

Exceptions:

CMSException (p. ***1031***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2277***) - if unexpected end of message stream has been reached.

MessageFormatException (p. ***2278***) - if this type conversion is invalid.

MessageNotReadableException (p. ***2330***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 473).

6.657.3.12 virtual unsigned short cms::StreamMessage::readUnsignedShort () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]

Reads a 16 bit unsigned short from the Stream message stream.

Returns:

unsigned short value from stream

Exceptions:

CMSException (p. ***1031***) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. ***2277***) - if unexpected end of message stream has been reached.

MessageFormatException (p. ***2278***) - if this type conversion is invalid.

MessageNotReadableException (p. ***2330***) - if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 473).

6.657.3.13 virtual void cms::StreamMessage::writeBoolean (bool *value*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Writes a boolean to the Stream message stream as a 1-byte value. The value true is written as the value (byte)1; the value false is written as the value (byte)0.

Parameters:

value boolean to write to the stream

Exceptions:

CMSException (p. ***1031***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2331***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 474).

6.657.3.14 virtual void cms::StreamMessage::writeByte (unsigned char *value*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Writes a byte to the Stream message stream as a 1-byte value.

Parameters:

value byte to write to the stream

Exceptions:

CMSException (p. ***1031***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2331***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 474).

6.657.3.15 virtual void cms::StreamMessage::writeBytes (const unsigned char * *value*, std::size_t *offset*, std::size_t *length*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Writes a portion of a byte array to the Stream message stream. size as the number of bytes to write.

Parameters:

value bytes to write to the stream

offset the initial offset within the byte array

length the number of bytes to use

Exceptions:

CMSException (p. ***1031***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2331***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 475).

6.657.3.16 virtual void cms::StreamMessage::writeBytes (const std::vector< unsigned char > & *value*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Writes a byte array to the Stream message stream using the vector size as the number of bytes to write.

Parameters:

value bytes to write to the stream

Exceptions:

CMSException (p. ***1031***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException *(p. 2331)* - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 475).

6.657.3.17 virtual void cms::StreamMessage::writeChar (char *value*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Writes a char to the Stream message stream as a 1-byte value.

Parameters:

value char to write to the stream

Exceptions:

CMSException *(p. 1031)* - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException *(p. 2331)* - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 475).

6.657.3.18 virtual void cms::StreamMessage::writeDouble (double *value*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Writes a double to the Stream message stream as a 8 byte value.

Parameters:

value double to write to the stream

Exceptions:

CMSException *(p. 1031)* - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException *(p. 2331)* - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 476).

6.657.3.19 virtual void cms::StreamMessage::writeFloat (float *value*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Writes a float to the Stream message stream as a 4 byte value.

Parameters:

value float to write to the stream

Exceptions:

CMSException *(p. 1031)* - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException *(p. 2331)* - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 476).

6.657.3.20 virtual void cms::StreamMessage::writeInt (int *value*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Writes a signed int to the Stream message stream as a 4 byte value.

Parameters:

value signed int to write to the stream

Exceptions:

CMSException (p. ***1031***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2331***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 476).

6.657.3.21 virtual void cms::StreamMessage::writeLong (long long *value*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Writes a long long to the Stream message stream as a 8 byte value.

Parameters:

value signed long long to write to the stream

Exceptions:

CMSException (p. ***1031***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2331***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 477).

6.657.3.22 virtual void cms::StreamMessage::writeShort (short *value*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Writes a signed short to the Stream message stream as a 2 byte value.

Parameters:

value signed short to write to the stream

Exceptions:

CMSException (p. ***1031***) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. ***2331***) - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 477).

6.657.3.23 virtual void cms::StreamMessage::writeString (const std::string & *value*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Writes an ASCII String to the Stream message stream.

Parameters:

value String to write to the stream

Exceptions:

CMSException *(*p. ***1031****)* - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException *(*p. ***2331****)* - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 477).

6.657.3.24 virtual void cms::StreamMessage::writeUnsignedShort (unsigned short *value*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Writes a unsigned short to the Stream message stream as a 2 byte value.

Parameters:

value unsigned short to write to the stream

Exceptions:

CMSException *(*p. ***1031****)* - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException *(*p. ***2331****)* - if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 478).

The documentation for this class was generated from the following file:

- src/main/cms/**StreamMessage.h**

6.658 decaf::util::StringTokenizer Class Reference

`#include <src/main/decaf/util/StringTokenizer.h>`

Public Member Functions

- **StringTokenizer** (const std::string &str, const std::string &delim=" \t\n\r\f", bool returnDelims=false)

  Constructs a string tokenizer for the specified string.

- virtual ~**StringTokenizer** ()
- virtual int **countTokens** () const

  Calculates the number of times that this tokenizer's nextToken method can be called before it generates an exception.

- virtual bool **hasMoreTokens** () const

  Tests if there are more tokens available from this tokenizer's string.

- virtual std::string **nextToken** () throw (lang::exceptions::NoSuchElementException)

  Returns the next token from this string tokenizer.

- virtual std::string **nextToken** (const std::string &delim) throw (lang::exceptions::NoSuchElementException)

  Returns the next token in this string tokenizer's string.

- virtual unsigned int **toArray** (std::vector< std::string > &array)

  Grab all remaining tokens in the String and return them in the vector that is passed in by reference.

- virtual void **reset** (const std::string &str="", const std::string &delim="", bool returnDelims=false)

  Resets the Tokenizer's position in the String to the Beginning calls to countToken and nextToken now start back at the beginning.

6.658.1 Constructor & Destructor Documentation

6.658.1.1 decaf::util::StringTokenizer::StringTokenizer (const std::string & *str*, const std::string & *delim* = " \t\n\r\f", bool *returnDelims* = false)

Constructs a string tokenizer for the specified string. All characters in the delim argument are the delimiters for separating tokens.

If the returnDelims flag is true, then the delimiter characters are also returned as tokens. Each delimiter is returned as a string of length one. If the flag is false, the delimiter characters are skipped and only serve as separators between tokens.

Note that if delim is "", this constructor does not throw an exception. However, trying to invoke other methods on the resulting **StringTokenizer** (p. 3094) may result in an Exception.

Parameters:

str - The string to tokenize

delim - String containing the delimiters

returnDelims - boolean indicating if the delimiters are returned as tokens

6.658.1.2 virtual decaf::util::StringTokenizer::~StringTokenizer () [virtual]

6.658.2 Member Function Documentation

6.658.2.1 virtual int decaf::util::StringTokenizer::countTokens () const [virtual]

Calculates the number of times that this tokenizer's nextToken method can be called before it generates an exception. The current position is not advanced.

Returns:

Count of remaining tokens

6.658.2.2 virtual bool decaf::util::StringTokenizer::hasMoreTokens () const [virtual]

Tests if there are more tokens available from this tokenizer's string.

Returns:

true if there are more tokens remaining

6.658.2.3 virtual std::string decaf::util::StringTokenizer::nextToken (const std::string & *delim*) throw (lang::exceptions::NoSuchElementException) [virtual]

Returns the next token in this string tokenizer's string. First, the set of characters considered to be delimiters by this **StringTokenizer** (p. 3094) object is changed to be the characters in the string delim. Then the next token in the string after the current position is returned. The current position is advanced beyond the recognized token. The new delimiter set remains the default after this call.

Parameters:

delim - string containing the new set of delimiters

Returns:

next string in the token list

Exceptions:

NoSuchElementException

6.658.2.4 virtual std::string decaf::util::StringTokenizer::nextToken () throw (lang::exceptions::NoSuchElementException) [virtual]

Returns the next token from this string tokenizer.

Returns:

string value of next token

Exceptions:

NoSuchElementException

6.658.2.5 virtual void decaf::util::StringTokenizer::reset (const std::string & *str* = "", const std::string & *delim* = "", bool *returnDelims* = false) [virtual]

Resets the Tokenizer's position in the String to the Beginning calls to countToken and nextToken now start back at the beginning. This allows this object to be reused, the caller need not create a new instance every time a String needs tokenizing. If set the string param will reset the string that this Tokenizer is working on. If set to "" no change is made. If set the delim param will reset the string that this Tokenizer is using to tokenizer the string. If set to "", no change is made If set the return Delims will set if this Tokenizer will return delimiters as tokens. Defaults to false.

Parameters:

str - New String to tokenize or "", defaults to ""

delim - New Delimiter String to use or "", defaults to ""

returnDelims - Should the Tokenizer return delimiters as Tokens, default false

6.658.2.6 virtual unsigned int decaf::util::StringTokenizer::toArray (std::vector< std::string > & *array*) [virtual]

Grab all remaining tokens in the String and return them in the vector that is passed in by reference.

Parameters:

array - vector to place token strings in

Returns:

number of string placed into the vector

6.659 activemq::commands::SubscriptionInfo Class Reference

`#include <src/main/activemq/commands/SubscriptionInfo.h>`Inheritance diagram for activemq::commands::SubscriptionInfo:

Public Member Functions

- **SubscriptionInfo** ()
- virtual ~**SubscriptionInfo** ()
- virtual unsigned char **getDataStructureType** () const

  Get the unique identifier that this object and its own Marshaler share.

- virtual **SubscriptionInfo** * **cloneDataStructure** () const

  Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

  Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure*** (p. *1461*) *such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure*** (p. *1461*) *passed in to this one, and returns if they are equivalent.*

- virtual const std::string & **getClientId** () const
- virtual std::string & **getClientId** ()
- virtual void **setClientId** (const std::string &**clientId**)
- virtual const **Pointer**< **ActiveMQDestination** > & **getDestination** () const
- virtual **Pointer**< **ActiveMQDestination** > & **getDestination** ()
- virtual void **setDestination** (const **Pointer**< **ActiveMQDestination** > &**destination**)
- virtual const std::string & **getSelector** () const
- virtual std::string & **getSelector** ()
- virtual void **setSelector** (const std::string &**selector**)
- virtual const std::string & **getSubcriptionName** () const
- virtual std::string & **getSubcriptionName** ()
- virtual void **setSubcriptionName** (const std::string &**subcriptionName**)
- virtual const **Pointer**< **ActiveMQDestination** > & **getSubscribedDestination** () const
- virtual **Pointer**< **ActiveMQDestination** > & **getSubscribedDestination** ()
- virtual void **setSubscribedDestination** (const **Pointer**< **ActiveMQDestination** > &**subscribedDestination**)

Static Public Attributes

- static const unsigned char **ID_SUBSCRIPTIONINFO** = 55

Protected Member Functions

- **SubscriptionInfo** (const **SubscriptionInfo** &)
- **SubscriptionInfo** & **operator**= (const **SubscriptionInfo** &)

Protected Attributes

- std::string **clientId**
- **Pointer**< **ActiveMQDestination** > **destination**
- std::string **selector**
- std::string **subcriptionName**
- **Pointer**< **ActiveMQDestination** > **subscribedDestination**

6.659.1 Constructor & Destructor Documentation

6.659.1.1 activemq::commands::SubscriptionInfo::SubscriptionInfo (const SubscriptionInfo &) [inline, protected]

6.659.1.2 activemq::commands::SubscriptionInfo::SubscriptionInfo ()

6.659.1.3 virtual activemq::commands::SubscriptionInfo::~SubscriptionInfo () [virtual]

6.659.2 Member Function Documentation

6.659.2.1 virtual SubscriptionInfo* activemq::commands::SubscriptionInfo::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.659.2.2 virtual void activemq::commands::SubscriptionInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Implements **activemq::commands::DataStructure** (p. 1462).

6.659.2.3 virtual bool activemq::commands::SubscriptionInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1463).

6.659.2.4 virtual std::string& activemq::commands::SubscriptionInfo::getClientId () [virtual]

6.659.2.5 virtual const std::string& activemq::commands::SubscriptionInfo::getClientId () const [virtual]

6.659.2.6 virtual unsigned char activemq::commands::SubscriptionInfo::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.659.2.7 virtual Pointer<ActiveMQDestination>& activemq::commands::SubscriptionInfo::getDestination () [virtual]

6.659.2.8 virtual const Pointer<ActiveMQDestination>& activemq::commands::SubscriptionInfo::getDestination () const [virtual]

6.659.2.9 virtual std::string& activemq::commands::SubscriptionInfo::getSelector () [virtual]

6.659.2.10 virtual const std::string& activemq::commands::SubscriptionInfo::getSelector () const [virtual]

6.659.2.11 virtual std::string& activemq::commands::SubscriptionInfo::getSubcriptionName () [virtual]

6.659.2.12 virtual const std::string& activemq::commands::SubscriptionInfo::getSubcriptionName () const [virtual]

6.659.2.13 virtual Pointer<ActiveMQDestination>& activemq::commands::SubscriptionInfo::getSubscribedDestination () [virtual]

6.659.2.14 virtual const Pointer<ActiveMQDestination>& activemq::commands::SubscriptionInfo::getSubscribedDestination () const [virtual]

6.659.2.15 SubscriptionInfo& activemq::commands::SubscriptionInfo::operator= (const SubscriptionInfo &) [inline, protected]

6.659.2.16 virtual void activemq::commands::SubscriptionInfo::setClientId (const std::string & *clientId*) [virtual]

6.659.2.17 virtual void activemq::commands::SubscriptionInfo::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.659.2.18 virtual void activemq::commands::SubscriptionInfo::setSelector (const std::string & *selector*) [virtual]

6.659.2.19 virtual void activemq::commands::SubscriptionInfo::setSubcriptionName (const std::string & *subcriptionName*) [virtual]

6.659.2.20 virtual void activemq::commands::SubscriptionInfo::setSubscribedDestination (const Pointer< ActiveMQDestination > & *subscribedDestination*) [virtual]

6.659.2.21 virtual std::string activemq::commands::SubscriptionInfo::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 718).

6.659.3 Field Documentation

6.659.3.1 std::string activemq::commands::SubscriptionInfo::clientId [protected]

6.659.3.2 Pointer<ActiveMQDestination> activemq::commands::SubscriptionInfo::destination [protected]

6.659.3.3 const unsigned char activemq::commands::SubscriptionInfo::ID_SUBSCRIPTIONINFO = 55 [static]

6.659.3.4 std::string activemq::commands::SubscriptionInfo::selector [protected]

6.659.3.5 std::string activemq::commands::SubscriptionInfo::subcriptionName [protected]

6.659.3.6 Pointer<ActiveMQDestination> activemq::commands::SubscriptionInfo::subscribedDestination [protected]

6.660 activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMar Class Reference

Marshaling code for Open Wire Format for **SubscriptionInfoMarshaller** (p. 3102).

`#include <src/main/activemq/wireformat/openwire/marshal/v1/SubscriptionInfoMarshaller.h>`Inheritan diagram for activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller:

Public Member Functions

- **SubscriptionInfoMarshaller** ()
- virtual ~**SubscriptionInfoMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.660.1 Detailed Description

Marshaling code for Open Wire Format for **SubscriptionInfoMarshaller** (p. 3102). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.660.2 Constructor & Destructor Documentation

6.660.2.1 activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::SubscriptionInfo () [inline]

6.660.2.2 virtual activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::~SubscriptionIn () [inline, virtual]

6.660.3 Member Function Documentation

6.660.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.660.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::getDataStructureT () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.660.3.3 virtual void activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.660.3.4 virtual void activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.660.3.5 virtual int activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.660.3.6 virtual void activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.660.3.7 virtual void activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

6.661.3 Member Function Documentation

6.661.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.661.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::getDataStructureT () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.661.3.3 virtual void activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.661.3.4 virtual void activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.661.3.5 virtual int activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.661.3.6 virtual void activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.661.3.7 virtual void activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

6.662.3 Member Function Documentation

6.662.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.662.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::getDataStructureT () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.662.3.3 virtual void activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.662.3.4 virtual void activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.662.3.5 virtual int activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.662.3.6 virtual void activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.662.3.7 virtual void activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

  Write a object instance to data output stream.

6.663.1 Detailed Description

Marshaling code for Open Wire Format for **SubscriptionInfoMarshaller** (p. 3114). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.663.2 Constructor & Destructor Documentation

6.663.2.1 activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::SubscriptionInfo () [inline]

6.663.2.2 virtual activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::~SubscriptionIn () [inline, virtual]

6.663.3 Member Function Documentation

6.663.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.663.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::getDataStructureT () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.663.3.3 virtual void activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.663.3.4 virtual void activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.663.3.5 virtual int activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.663.3.6 virtual void activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.663.3.7 virtual void activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

The documentation for this class was generated from the following file:

6.664.3 Member Function Documentation

6.664.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.664.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::getDataStructureT () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.664.3.3 virtual void activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.664.3.4 virtual void activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.664.3.5 virtual int activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.664.3.6 virtual void activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.664.3.7 virtual void activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

6.665 decaf::util::concurrent::Synchronizable Class Reference

The interface for all synchronizable objects (that is, objects that can be locked and unlocked).

`#include <src/main/decaf/util/concurrent/Synchronizable.h>`Inheritance diagram for decaf::util::concurrent::Synchronizable:

Public Member Functions

- virtual ~**Synchronizable** ()
- virtual void **lock** ()=0 throw (decaf::lang::exceptions::RuntimeException)

  Locks the object.

- virtual bool **tryLock** ()=0 throw (decaf::lang::exceptions::RuntimeException)

  *Attempts to **Lock** (*p. 2023*) the object, if the lock is already held by another thread than this method returns false.*

- virtual void **unlock** ()=0 throw (decaf::lang::exceptions::RuntimeException)

  Unlocks the object.

- virtual void **wait** ()=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs)=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos)=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** ()=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** ()=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals the waiters on this object that it can now wake up and continue.

6.665.1 Detailed Description

The interface for all synchronizable objects (that is, objects that can be locked and unlocked).

Since:

1.0

6.665.2 Constructor & Destructor Documentation

6.665.2.1 virtual decaf::util::concurrent::Synchronizable::~Synchronizable () [inline, virtual]

6.665.3 Member Function Documentation

6.665.3.1 virtual void decaf::util::concurrent::Synchronizable::lock () throw (decaf::lang::exceptions::RuntimeException) [pure virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implemented in **activemq::core::MessageDispatchChannel** (p. 2227), **decaf::internal::io::StandardErrorOutputStream** (p. 2996), **decaf::internal::io::StandardInputStream** (p. 3002), **decaf::internal::io::StandardOutputStream** (p. 3009), **decaf::internal::util::concurrent::SynchronizableImpl** (p. 3134), **decaf::io::BlockingByteArrayInputStream** (p. 726), **decaf::io::ByteArrayInputStream** (p. 895), **decaf::io::ByteArrayOutputStream** (p. 902), **decaf::io::FilterInputStream** (p. 1634), **decaf::io::FilterOutputStream** (p. 1643), **decaf::net::SocketInputStream** (p. 2979), **decaf::net::SocketOutputStream** (p. 2986), **decaf::util::AbstractCollection< E >** (p. 154), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1110), **decaf::util::concurrent::Mutex** (p. 2386), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 3037), **decaf::util::StlQueue< T >** (p. 3047), **decaf::util::AbstractCollection< transport::TransportListener * >** (p. 154), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 154), **decaf::util::AbstractCollection< CompositeTask * >** (p. 154), **decaf::util::AbstractCollection< URI >** (p. 154), **decaf::util::AbstractCollection< ActiveMQSession * >** (p. 154), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 154), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 154), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 154), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 154), **decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >** (p. 1110), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 1110), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 1110), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1110), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1110), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer<**

ProducerState >, **ProducerId::COMPARATOR >** (p. 1110), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 3037), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 3037), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 3037), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 3037), **decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >** (p. 3037), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 3037), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 3037), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 3037), **decaf::util::StlMap< int, Pointer< Command > >** (p. 3037), **decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >** (p. 3037), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 3037), **decaf::util::StlMap< std::string, cms::Topic * >** (p. 3037), **decaf::util::StlQueue< Pointer< Transport > >** (p. 3047), **decaf::util::StlQueue< Pointer< MessageDispatch > >** (p. 3047), **decaf::util::StlQueue< Task >** (p. 3047), **decaf::util::StlQueue< Pointer< Command > >** (p. 3047), and **decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >** (p. 3047).

Referenced by decaf::util::concurrent::Lock::lock().

6.665.3.2 virtual void decaf::util::concurrent::Synchronizable::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [pure virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 3122) Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implemented in **activemq::core::MessageDispatchChannel** (p. 2227), **decaf::internal::io::StandardErrorOutputStream** (p. 2996), **decaf::internal::io::StandardInputStream** (p. 3003), **decaf::internal::io::StandardOutputStream** (p. 3010), **decaf::internal::util::concurrent::SynchronizableImpl** (p. 3134), **decaf::io::BlockingByteArrayInputStream** (p. 727), **decaf::io::ByteArrayInputStream** (p. 895), **decaf::io::ByteArrayOutputStream** (p. 902), **decaf::io::FilterInputStream** (p. 1635), **decaf::io::FilterOutputStream** (p. 1643), **decaf::net::SocketInputStream** (p. 2980), **decaf::net::SocketOutputStream** (p. 2986), **decaf::util::AbstractCollection< E >** (p. 154), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1110), **decaf::util::concurrent::Mutex** (p. 2386), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 3038), **decaf::util::StlQueue< T >** (p. 3047), **decaf::util::AbstractCollection< transport::TransportListener * >** (p. 154), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 154), **decaf::util::AbstractCollection< CompositeTask * >** (p. 154), **decaf::util::AbstractCollection< URI >** (p. 154), **decaf::util::AbstractCollection< ActiveMQSession * >** (p. 154), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 154), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 154), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 154), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 154), **decaf::util::concurrent::ConcurrentStlMap<**

Pointer< TransactionId >, **Pointer< TransactionState >**, **TransactionId::COMPARATOR >** (p. 1110), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 1110), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 1110), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1110), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1110), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1110), **decaf::util::StlMap< cms::Session ∗, SessionResolver ∗ >** (p. 3038), **decaf::util::StlMap< std::string, WireFormatFactory ∗ >** (p. 3038), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 3038), **decaf::util::StlMap< std::string, cms::Queue ∗ >** (p. 3038), **decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer ∗, commands::ProducerId::COMPARATOR >** (p. 3038), **decaf::util::StlMap< std::string, CachedConsumer ∗ >** (p. 3038), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer ∗, commands::ConsumerId::COMPARATOR >** (p. 3038), **decaf::util::StlMap< std::string, TransportFactory ∗ >** (p. 3038), **decaf::util::StlMap< int, Pointer< Command > >** (p. 3038), **decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher ∗, commands::ConsumerId::COMPARATOR >** (p. 3038), **decaf::util::StlMap< std::string, CachedProducer ∗ >** (p. 3038), **decaf::util::StlMap< std::string, cms::Topic ∗ >** (p. 3038), **decaf::util::StlQueue< Pointer< Transport > >** (p. 3047), **decaf::util::StlQueue< Pointer< MessageDispatch > >** (p. 3047), **decaf::util::StlQueue< Task >** (p. 3047), **decaf::util::StlQueue< Pointer< Command > >** (p. 3047), and **decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >** (p. 3047).

6.665.3.3 virtual void decaf::util::concurrent::Synchronizable::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [pure virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 3122) Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implemented in **activemq::core::MessageDispatchChannel** (p. 2227), **decaf::internal::io::StandardErrorOutputStream** (p. 2996), **decaf::internal::io::StandardInputStream** (p. 3003), **decaf::internal::io::StandardOutputStream** (p. 3010), **decaf::internal::util::concurrent::SynchronizableImpl** (p. 3134), **decaf::io::BlockingByteArrayInputStream** (p. 727), **decaf::io::ByteArrayInputStream** (p. 896), **decaf::io::ByteArrayOutputStream** (p. 903), **decaf::io::FilterInputStream** (p. 1635), **decaf::io::FilterOutputStream** (p. 1643), **decaf::net::SocketInputStream** (p. 2980), **decaf::net::SocketOutputStream** (p. 2986), **decaf::util::AbstractCollection< E >** (p. 154), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1110), **decaf::util::concurrent::Mutex** (p. 2387), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 3038), **decaf::util::StlQueue< T >** (p. 3047), **decaf::util::AbstractCollection< transport::TransportListener ∗**

> (p. 154), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 154), **decaf::util::AbstractCollection< CompositeTask * >** (p. 154), **decaf::util::AbstractCollection< URI >** (p. 154), **decaf::util::AbstractCollection< ActiveMQSession * >** (p. 154), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 154), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 154), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 154), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 154), **decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >** (p. 1110), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 1110), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 1110), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1110), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1110), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1110), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 3038), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 3038), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 3038), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 3038), **decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >** (p. 3038), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 3038), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 3038), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 3038), **decaf::util::StlMap< int, Pointer< Command > >** (p. 3038), **decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >** (p. 3038), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 3038), **decaf::util::StlMap< std::string, cms::Topic * >** (p. 3038), **decaf::util::StlQueue< Pointer< Transport > >** (p. 3047), **decaf::util::StlQueue< Pointer< MessageDispatch > >** (p. 3047), **decaf::util::StlQueue< Task >** (p. 3047), **decaf::util::StlQueue< Pointer< Command > >** (p. 3047), and **decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >** (p. 3047).

6.665.3.4 virtual bool decaf::util::concurrent::Synchronizable::tryLock () throw (decaf::lang::exceptions::RuntimeException) [pure virtual]

Attempts to **Lock** (p. 2023) the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Referenced by decaf::util::concurrent::Lock::unlock(), and decaf::util::concurrent::Lock::~Lock().

6.665.3.6 virtual void decaf::util::concurrent::Synchronizable::wait (long long *millisecs*, int *nanos*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [pure virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 3122) Object.

Implemented in **activemq::core::MessageDispatchChannel** (p. 2229), **decaf::internal::io::StandardErrorOutputStream** (p. 2997), **decaf::internal::io::StandardInputStream** (p. 3005), **decaf::internal::io::StandardOutputStream** (p. 3011), **decaf::internal::util::concurrent::SynchronizableImpl** (p. 3135), **decaf::io::BlockingByteArrayInputStream** (p. 730), **decaf::io::ByteArrayInputStream** (p. 898), **decaf::io::ByteArrayOutputStream** (p. 905), **decaf::io::FilterInputStream** (p. 1638), **decaf::io::FilterOutputStream** (p. 1644), **decaf::net::SocketInputStream** (p. 2982), **decaf::net::SocketOutputStream** (p. 2987), **decaf::util::AbstractCollection< E >** (p. 158), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1115), **decaf::util::concurrent::Mutex** (p. 2388), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 3041), **decaf::util::StlQueue< T >** (p. 3049), **decaf::util::AbstractCollection< transport::TransportListener * >** (p. 158), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 158), **decaf::util::AbstractCollection< CompositeTask * >** (p. 158), **decaf::util::AbstractCollection< URI >** (p. 158), **decaf::util::AbstractCollection< ActiveMQSession * >** (p. 158), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 158), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 158), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 158), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 158), **decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >** (p. 1115), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 1115), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR**

6.665.3.8 virtual void decaf::util::concurrent::Synchronizable::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [pure virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 3122) Object.

Implemented in **activemq::core::MessageDispatchChannel** (p. 2230), **decaf::internal::io::StandardErrorOutputStream** (p. 2998), **decaf::internal::io::StandardInputStream** (p. 3006), **decaf::internal::io::StandardOutputStream** (p. 3012), **decaf::internal::util::concurrent::SynchronizableImpl** (p. 3136), **decaf::io::BlockingByteArrayInputStream** (p. 731), **decaf::io::ByteArrayInputStream** (p. 899), **decaf::io::ByteArrayOutputStream** (p. 906), **decaf::io::FilterInputStream** (p. 1639), **decaf::io::FilterOutputStream** (p. 1645), **decaf::net::SocketInputStream** (p. 2983), **decaf::net::SocketOutputStream** (p. 2988), **decaf::util::AbstractCollection< E >** (p. 159), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1116), **decaf::util::concurrent::Mutex** (p. 2389), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 3042), **decaf::util::StlQueue< T >** (p. 3050), **decaf::util::AbstractCollection< transport::TransportListener * >** (p. 159), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 159), **decaf::util::AbstractCollection< CompositeTask * >** (p. 159), **decaf::util::AbstractCollection< URI >** (p. 159), **decaf::util::AbstractCollection< ActiveMQSession * >** (p. 159), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 159), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 159), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 159), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 159), **decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >** (p. 1116), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 1116), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 1116), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1116), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1116), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1116), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 3042), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 3042), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 3042), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 3042), **decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >** (p. 3042), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 3042), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 3042), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 3042), **decaf::util::StlMap< int, Pointer< Command > >** (p. 3042), **decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >** (p. 3042), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 3042), **decaf::util::StlMap< std::string, cms::Topic * >** (p. 3042), **decaf::util::StlQueue< Pointer< Transport > >** (p. 3050), **decaf::util::StlQueue< Pointer< MessageDispatch > >** (p. 3050), **decaf::util::StlQueue< Task >** (p. 3050), **decaf::util::StlQueue< Pointer< Command > >** (p. 3050), and **decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >** (p. 3050).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**Synchronizable.h**

6.666 decaf::internal::util::concurrent::SynchronizableImpl Class Reference

A convenience class used by some Decaf classes to implement the Synchronizable interface when there is no issues related to multiple inheritance.

`#include <src/main/decaf/internal/util/concurrent/SynchronizableImpl.h>`Inheritance diagram for decaf::internal::util::concurrent::SynchronizableImpl:

Public Member Functions

- **SynchronizableImpl** ()
- virtual ~**SynchronizableImpl** ()
- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)

  Locks the object.

- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)

  Unlocks the object.

- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals the waiters on this object that it can now wake up and continue.

6.666.1 Detailed Description

A convenience class used by some Decaf classes to implement the Synchronizable interface when there is no issues related to multiple inheritance.

Since:

1.0

6.666.2 Constructor & Destructor Documentation

6.666.2.1 decaf::internal::util::concurrent::SynchronizableImpl::SynchronizableImpl ()

6.666.2.2 virtual decaf::internal::util::concurrent::SynchronizableImpl::~SynchronizableImpl () [virtual]

6.666.3 Member Function Documentation

6.666.3.1 virtual void decaf::internal::util::concurrent::SynchronizableImpl::lock () throw (decaf::lang::exceptions::RuntimeException) [virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3123).

6.666.3.2 virtual void decaf::internal::util::concurrent::SynchronizableImpl::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3124).

6.666.3.3 virtual void decaf::internal::util::concurrent::SynchronizableImpl::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3125).

6.666.3.4 virtual bool decaf::internal::util::concurrent::SynchronizableImpl::tryLock () throw (decaf::lang::exceptions::RuntimeException) [virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3126).

6.666.3.5 virtual void decaf::internal::util::concurrent::SynchronizableImpl::unlock () throw (decaf::lang::exceptions::RuntimeException) [virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3127).

6.666.3.6 virtual void decaf::internal::util::concurrent::SynchronizableImpl::wait (long long *millisecs*, int *nanos*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3128).

6.666.3.7 virtual void decaf::internal::util::concurrent::SynchronizableImpl::wait (long long *millisecs*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3130).

6.666.3.8 virtual void decaf::internal::util::concurrent::SynchronizableImpl::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3131).

6.668.1 Detailed Description

template<typename E> class decaf::util::concurrent::SynchronousQueue< E >

A BlockingQueue blocking queue} in which each insert operation must wait for a corresponding remove operation by another thread, and vice versa. A synchronous queue does not have any internal capacity, not even a capacity of one. You cannot `peek` at a synchronous queue because an element is only present when you try to remove it; you cannot insert an element (using any method) unless another thread is trying to remove it; you cannot iterate as there is nothing to iterate. The *head* of the queue is the element that the first queued inserting thread is trying to add to the queue; if there is no such queued thread then no element is available for removal and `poll()` (p. 3142) will return `null`. For purposes of other `Collection` (p. 1054) methods (for example `contains`), a `SynchronousQueue` (p. 3138) acts as an empty collection. This queue does not permit `null` elements.

Synchronous queues are similar to rendezvous channels used in CSP and Ada. They are well suited for handoff designs, in which an object running in one thread must sync up with an object running in another thread in order to hand it some information, event, or task.

This class supports an optional fairness policy for ordering waiting producer and consumer threads. By default, this ordering is not guaranteed. However, a queue constructed with fairness set to `true` grants threads access in FIFO order.

This class and its iterator implement all of the *optional* methods of the **Collection** (p. 1054) and **Iterator** (p. 1832) interfaces.

Since:

1.0

References decaf::util::concurrent::SynchronousQueue< E >::poll().

6.668.3.6 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::equals (const Collection< E > & *value*) const `[inline, virtual]`

6.668.3.7 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::isEmpty () const `[inline, virtual]`

6.668.3.8 template<typename E > virtual decaf::util::Iterator<E>* decaf::util::concurrent::SynchronousQueue< E >::iterator () const `[inline, virtual]`

6.668.3.9 template<typename E > virtual decaf::util::Iterator<E>* decaf::util::concurrent::SynchronousQueue< E >::iterator () `[inline, virtual]`

6.668.3.10 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::offer (const E & *value*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException) `[inline, virtual]`

Inserts the specified element into this queue, if another thread is waiting to receive it.

Parameters:

value the element to add to the **Queue** (p. 2671)

Returns:

`true` if the element was added to this queue, else `false`

Exceptions:

NullPointerException if the **Queue** (p. 2671) implementation does not allow Null values to be inserted into the **Queue** (p. 2671).

IllegalArgumentException if some property of the specified element prevents it from being added to this queue

6.668.3.11 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::offer (const E & *e*, long *timeout*, const TimeUnit & *unit*) throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException) `[inline, virtual]`

Inserts the specified element into this queue, waiting if necessary up to the specified wait time for another thread to receive it.

Returns:

`true` if successful, or `false` if the specified waiting time elapses before a consumer appears.

Exceptions:

InterruptedException

NullPointerException

IllegalArgumentException

6.668.3.12 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::peek (E &result *DECAF_UNUSED*) const [inline, virtual]

6.668.3.13 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::poll (E & *result*) [inline, virtual]

Retrieves and removes the head of this queue, if another thread is currently making an element available.

Parameters:

result a reference to the value where the head of the **Queue** (p. 2671) should be copied to.

Returns:

true if the head of the **Queue** (p. 2671) was copied to the result param or false if no value could be returned.

6.668.3.14 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::poll (E & *result*, long long *timeout*, const TimeUnit & *unit*) throw (decaf::lang::exceptions::InterruptedException) [inline, virtual]

Retrieves and removes the head of this queue, waiting if necessary up to the specified wait time, for another thread to insert it.

Parameters:

result a reference to the value where the head of the **Queue** (p. 2671) should be copied to.

timeout the time that the method should block if there is no element available to return.

unit the Time Units that the timeout value represents.

Returns:

true if the head of the **Queue** (p. 2671) was copied to the result param or false if no value could be returned.

Referenced by decaf::util::concurrent::SynchronousQueue< E >::drainTo().

6.668.3.15 template<typename E > virtual void decaf::util::concurrent::SynchronousQueue< E >::put (const E & *value*) throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException) [inline, virtual]

Adds the specified element to this queue, waiting if necessary for another thread to receive it.

Parameters:

value the element to add to the **Queue** (p. 2671).

Exceptions:

InterruptedException

NullPointerException

IllegalArgumentException

6.668.3.16 template<typename E > virtual int decaf::util::concurrent::SynchronousQueue< E >::remainingCapacity () const `[inline, virtual]`

6.668.3.17 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::remove (const E &value *DECAF_UNUSED*) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException) `[inline, virtual]`

6.668.3.18 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::removeAll (const Collection< E > &collection *DECAF_UNUSED*) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException) `[inline, virtual]`

6.668.3.19 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::retainAll (const Collection< E > &collection *DECAF_UNUSED*) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException) `[inline, virtual]`

6.669 decaf::lang::System Class Reference

`#include <src/main/decaf/lang/System.h>`

Public Member Functions

- **System** ()
- virtual ~**System** ()

Static Public Member Functions

- static const **util::Map**< std::string, std::string > & **getenv** () throw (lang::Exception)

  Enumerates the system environment and returns a map of env variable names to the string values they hold.

- static std::string **getenv** (const std::string &name) throw (lang::Exception)

  Reads an environment value from the system and returns it as a string object.

- static void **unsetenv** (const std::string &name) throw (lang::Exception)

  Clears a set env value if one is set.

- static void **setenv** (const std::string &name, const std::string &value) throw (lang::Exception)

  Sets the specified system property to the value given.

- static long long **currentTimeMillis** ()

  Returns the current time in milliseconds.

- static long long **nanoTime** ()

  Returns the current value of the most precise available system timer, in nanoseconds.

- static int **availableProcessors** ()

  Returns the number of processors available for exection of Decaf Threads.

6.669.1 Constructor & Destructor Documentation

6.669.1.1 decaf::lang::System::System ()

6.669.1.2 virtual decaf::lang::System::~System () `[inline, virtual]`

6.669.2 Member Function Documentation

6.669.2.1 static int decaf::lang::System::availableProcessors () `[static]`

Returns the number of processors available for exection of Decaf Threads. This value may change during a particular execution of a Decaf based application. Applications that are sensitive to the number of available processors should therefore occasionally poll this property and adjust their resource usage appropriately.

Returns:

the number of available processors.

6.669.2.2 static long long decaf::lang::System::currentTimeMillis () [static]

Returns the current time in milliseconds. Note that while the unit of time of the return value is a millisecond, the granularity of the value depends on the underlying operating system and may be larger. For example, many operating systems measure time in units of tens of milliseconds.

See the description of the class Date for a discussion of slight discrepancies that may arise between "computer time" and coordinated universal time (UTC).

Returns:

the difference, measured in milliseconds, between the current time and midnight, January 1, 1970 UTC.

6.669.2.3 static std::string decaf::lang::System::getenv (const std::string & *name*) throw (lang::Exception) [static]

Reads an environment value from the system and returns it as a string object.

Parameters:

name - the env var to read

Returns:

a string with the value from the var or ""

Exceptions:

an **Exception** (p. 1574) if an error occurs while reading the Env.

6.669.2.4 static const util::Map<std::string, std::string>& decaf::lang::System::getenv () throw (lang::Exception) [static]

Enumerates the system environment and returns a map of env variable names to the string values they hold.

Returns:

A Map of all environment variables.

Exceptions:

Exception *(*p. ***1574****)* if an error occurs

6.669.2.5 static long long decaf::lang::System::nanoTime () [static]

Returns the current value of the most precise available system timer, in nanoseconds. This method can only be used to measure elapsed time and is not related to any other notion of system or wall-clock time. The value returned represents nanoseconds since some fixed but arbitrary time (perhaps in the future, so values may be negative). This method provides nanosecond precision, but not necessarily nanosecond accuracy. No guarantees are made about how frequently values change. Differences in successive calls that span greater than approximately 292 years (263 nanoseconds) will not accurately compute elapsed time due to numerical overflow.

For example, to measure how long some code takes to execute:

long long startTime = **System::nanoTime()** (p. 3147); // ... the code being measured ... long long estimatedTime = **System::nanoTime()** (p. 3147) - startTime;

Returns:

The current value of the system timer, in nanoseconds.

6.669.2.6 static void decaf::lang::System::setenv (const std::string & *name*, const std::string & *value*) throw (lang::Exception) [static]

Sets the specified system property to the value given.

Parameters:

name - name of the env val to set

value - value to assign to name

Exceptions:

***an* Exception** (p. 1574) if an error occurs

6.669.2.7 static void decaf::lang::System::unsetenv (const std::string & *name*) throw (lang::Exception) [static]

Clears a set env value if one is set.

Parameters:

name - the env var to clear

Exceptions:

***an* Exception** (p. 1574) if an error occurs while reading the Env.

6.673 decaf::net::TcpSocket Class Reference

Platform-independent implementation of the socket interface.

`#include <src/main/decaf/net/TcpSocket.h>`Inheritance diagram for decaf::net::TcpSocket:

Public Member Functions

- **TcpSocket** () throw (SocketException)
  Construct a non-connected socket.
- **TcpSocket** (**SocketHandle** socketHandle)
  Construct a connected or bound socket based on given socket handle.
- virtual ~**TcpSocket** ()
  Releases the socket handle but not gracefully shut down the connection.
- **SocketHandle getSocketHandle** ()
  Gets the handle for the socket.
- void **connect** (const char *host, int port, int timeout) throw (SocketException)
  Connects to the specified destination.
- virtual void **connect** (const char *host, int port) throw (SocketException)
  Connects to the specified destination.
- virtual bool **isConnected** () const
  Indicates whether or not this socket is connected to a destination.
- virtual **io::InputStream** * **getInputStream** ()
  Gets the InputStream for this socket.
- virtual **io::OutputStream** * **getOutputStream** ()
  Gets the OutputStream for this socket.
- virtual int **getSoLinger** () const throw (SocketException)
  Gets the linger time.
- virtual void **setSoLinger** (int linger) throw (SocketException)
  Sets the linger time.
- virtual bool **getKeepAlive** () const throw (SocketException)
  Gets the keep alive flag.
- virtual void **setKeepAlive** (bool keepAlive) throw (SocketException)
  Enables/disables the keep alive flag.
- virtual int **getReceiveBufferSize** () const throw (SocketException)

Gets the receive buffer size.

- virtual void **setReceiveBufferSize** (int size) throw (SocketException)
  Sets the recieve buffer size.
- virtual bool **getReuseAddress** () const throw (SocketException)
  Gets the reuse address flag.
- virtual void **setReuseAddress** (bool reuse) throw (SocketException)
  Sets the reuse address flag.
- virtual int **getSendBufferSize** () const throw (SocketException)
  Gets the send buffer size.
- virtual void **setSendBufferSize** (int size) throw (SocketException)
  Sets the send buffer size.
- virtual int **getSoTimeout** () const throw (SocketException)
  Gets the timeout for socket operations.
- virtual void **setSoTimeout** (int timeout) throw (SocketException)
  Sets the timeout for socket operations.
- virtual void **close** () throw (decaf::io::IOException)
  Closes this object and deallocates the appropriate resources.
- virtual bool **getTcpNoDelay** () const throw (lang::Exception)
  Gets the Status of the TCP_ NODELAY param for this socket as a Bool.
- virtual void **setTcpNoDelay** (bool value) throw (lang::Exception)
  Sets the Status of the TCP_ NODELAY param for this socket as a Bool.

Protected Member Functions

- void **checkResult** (apr_status_t value) const throw (SocketException)

6.673.1 Detailed Description

Platform-independent implementation of the socket interface.

6.673.2 Constructor & Destructor Documentation

6.673.2.1 decaf::net::TcpSocket::TcpSocket () throw (SocketException)

Construct a non-connected socket.

Exceptions:

SocketException *(*p. *2972)* thrown one windows if the static initialization call to WSAStartup was not successful.

6.673.2.2 decaf::net::TcpSocket::TcpSocket (SocketHandle *socketHandle*)

Construct a connected or bound socket based on given socket handle.

Parameters:

socketHandle a socket handle to wrap in the object

6.673.2.3 virtual decaf::net::TcpSocket::~TcpSocket () [virtual]

Releases the socket handle but not gracefully shut down the connection.

6.673.3 Member Function Documentation

6.673.3.1 void decaf::net::TcpSocket::checkResult (apr_status_t *value*) const throw (SocketException) [protected]

6.673.3.2 virtual void decaf::net::TcpSocket::close () throw (decaf::io::IOException) [virtual]

Closes this object and deallocates the appropriate resources.

Exceptions:

IOException

Implements **decaf::io::Closeable** (p. 1019).

6.673.3.3 virtual void decaf::net::TcpSocket::connect (const char * *host*, int *port*) throw (SocketException) [inline, virtual]

Connects to the specified destination. Closes this socket if connected to another destination.

Parameters:

host The host of the server to connect to.

port The port of the server to connect to.

Exceptions:

SocketException *(*p. *2972)* Thrown if a failure occurred in the connect.

Implements **decaf::net::Socket** (p. 2965).

6.673.3.4 void decaf::net::TcpSocket::connect (const char * *host*, int *port*, int *timeout*) throw (SocketException)

Connects to the specified destination. Closes this socket if connected to another destination.

Parameters:

host The host of the server to connect to.

port The port of the server to connect to.

timeout of socket in microseconds

Exceptions:

SocketException *(*p. *2972)* Thrown if a failure occurred in the connect.

6.673.3.5 virtual io::InputStream* decaf::net::TcpSocket::getInputStream () [virtual]

Gets the InputStream for this socket.

Returns:

The InputStream for this socket. NULL if not connected.

Implements **decaf::net::Socket** (p. 2966).

6.673.3.6 virtual bool decaf::net::TcpSocket::getKeepAlive () const throw (SocketException) [virtual]

Gets the keep alive flag.

Returns:

True if keep alive is enabled.

Exceptions:

SocketException *(*p. *2972)* if the operation fails.

Implements **decaf::net::Socket** (p. 2966).

6.673.3.7 virtual io::OutputStream* decaf::net::TcpSocket::getOutputStream () [virtual]

Gets the OutputStream for this socket.

Returns:

the OutputStream for this socket. NULL if not connected.

Implements **decaf::net::Socket** (p. 2966).

6.673.3.8 virtual int decaf::net::TcpSocket::getReceiveBufferSize () const throw (SocketException) [virtual]

Gets the receive buffer size.

Returns:

the receive buffer size in bytes.

Exceptions:

SocketException *(*p. *2972)* if the operation fails.

Implements **decaf::net::Socket** (p. 2966).

6.673.3.9 virtual bool decaf::net::TcpSocket::getReuseAddress () const throw (SocketException) [virtual]

Gets the reuse address flag.

Returns:

True if the address can be reused.

Exceptions:

SocketException *(*p. *2972)* if the operation fails.

Implements **decaf::net::Socket** (p. 2967).

6.673.3.10 virtual int decaf::net::TcpSocket::getSendBufferSize () const throw (SocketException) [virtual]

Gets the send buffer size.

Returns:

the size in bytes of the send buffer.

Exceptions:

SocketException *(*p. *2972)* if the operation fails.

Implements **decaf::net::Socket** (p. 2967).

6.673.3.11 SocketHandle decaf::net::TcpSocket::getSocketHandle () [inline]

Gets the handle for the socket.

Returns:

SocketHabler for this **Socket** (p. 2964), can be NULL

6.673.3.12 virtual int decaf::net::TcpSocket::getSoLinger () const throw (SocketException) [virtual]

Gets the linger time.

Returns:

The linger time in seconds.

Exceptions:

SocketException *(*p. *2972)* if the operation fails.

Implements **decaf::net::Socket** (p. 2967).

6.673.3.13 virtual int decaf::net::TcpSocket::getSoTimeout () const throw (SocketException) [virtual]

Gets the timeout for socket operations.

Returns:

The timeout in milliseconds for socket operations.

Exceptions:

SocketException *(* p. *2972)* Thrown if unable to retrieve the information.

Implements **decaf::net::Socket** (p. 2967).

6.673.3.14 virtual bool decaf::net::TcpSocket::getTcpNoDelay () const throw (lang::Exception) [virtual]

Gets the Status of the TCP_NODELAY param for this socket as a Bool.

Returns:

true if TCP_NODELAY is enabled

Exceptions:

Exception

6.673.3.15 virtual bool decaf::net::TcpSocket::isConnected () const [inline, virtual]

Indicates whether or not this socket is connected to a destination.

Returns:

true if connected

Implements **decaf::net::Socket** (p. 2968).

6.673.3.16 virtual void decaf::net::TcpSocket::setKeepAlive (bool *keepAlive*) throw (SocketException) [virtual]

Enables/disables the keep alive flag.

Parameters:

keepAlive If true, enables the flag.

Exceptions:

SocketException *(* p. *2972)* if the operation fails.

Implements **decaf::net::Socket** (p. 2968).

6.673.3.17 virtual void decaf::net::TcpSocket::setReceiveBufferSize (int *size*) throw (SocketException) [virtual]

Sets the recieve buffer size.

Parameters:

size Number of bytes to set the receive buffer to.

Exceptions:

SocketException *(*p. *2972)* if the operation fails.

Implements **decaf::net::Socket** (p. 2968).

6.673.3.18 virtual void decaf::net::TcpSocket::setReuseAddress (bool *reuse*) throw (SocketException) [virtual]

Sets the reuse address flag.

Parameters:

reuse If true, sets the flag.

Exceptions:

SocketException *(*p. *2972)* if the operation fails.

Implements **decaf::net::Socket** (p. 2969).

6.673.3.19 virtual void decaf::net::TcpSocket::setSendBufferSize (int *size*) throw (SocketException) [virtual]

Sets the send buffer size.

Parameters:

size The number of bytes to set the send buffer to.

Exceptions:

SocketException *(*p. *2972)* if the operation fails.

Implements **decaf::net::Socket** (p. 2969).

6.673.3.20 virtual void decaf::net::TcpSocket::setSoLinger (int *linger*) throw (SocketException) [virtual]

Sets the linger time.

Parameters:

linger The linger time in seconds. If 0, linger is off.

Exceptions:

SocketException *(*p. *2972)* if the operation fails.

Implements **decaf::net::Socket** (p. 2969).

6.673.3.21 virtual void decaf::net::TcpSocket::setSoTimeout (int *timeout*) throw (SocketException) [virtual]

Sets the timeout for socket operations.

Parameters:

timeout The timeout in milliseconds for socket operations.

Exceptions:

SocketException *(*p. *2972)* Thrown if unable to set the information.

Implements **decaf::net::Socket** (p. 2969).

6.673.3.22 virtual void decaf::net::TcpSocket::setTcpNoDelay (bool *value*) throw (lang::Exception) [virtual]

Sets the Status of the TCP_NODELAY param for this socket as a Bool.

Parameters:

value - true if TCP_NODELAY is to be enabled

Exceptions:

Exception

The documentation for this class was generated from the following file:

- src/main/decaf/net/**TcpSocket.h**

6.674 activemq::transport::tcp::TcpTransport Class Reference

Implements a TCP/IP based transport filter, this transport is meant to wrap an instance of an **IOTransport** (p. 1823).

`#include <src/main/activemq/transport/tcp/TcpTransport.h>`Inheritance diagram for activemq::transport::tcp::TcpTransport:

Public Member Functions

- **TcpTransport** (const **decaf::util::Properties** &properties, const **Pointer< Transport > &next**)

  Constructor.

- **TcpTransport** (const **decaf::net::URI** &uri, const **decaf::util::Properties** &properties, const **Pointer< Transport > &next**)

  Constructor.

- virtual ~**TcpTransport** ()
- virtual void **close** () throw (decaf::io::IOException)

  Delegates to the superclass and then closes the socket.

- virtual bool **isFaultTolerant** () const

  *Is this **Transport** (p. 3273) fault tolerant, meaning that it will reconnect to a broker on disconnect.*

- virtual bool **isConnected** () const

  *Is the **Transport** (p. 3273) Connected to its Broker.*

- virtual bool **isClosed** () const

  *Has the **Transport** (p. 3273) been shutdown and no longer usable.*

6.674.1 Detailed Description

Implements a TCP/IP based transport filter, this transport is meant to wrap an instance of an **IOTransport** (p. 1823). The lower level transport should take care of managing stream reads and writes.

6.674.2 Constructor & Destructor Documentation

6.674.2.1 activemq::transport::tcp::TcpTransport::TcpTransport (const decaf::util::Properties & *properties*, const Pointer< Transport > & *next*)

Constructor.

Parameters:

properties the configuration properties for this transport

next the next transport in the chain

6.674.2.2 activemq::transport::tcp::TcpTransport::TcpTransport (const decaf::net::URI & *uri*, const decaf::util::Properties & *properties*, const Pointer< Transport > & *next*)

Constructor.

Parameters:

uri - The URI containing the host to connect to.

properties the configuration properties for this transport

next the next transport in the chain

6.674.2.3 virtual activemq::transport::tcp::TcpTransport::~TcpTransport () [virtual]

6.674.3 Member Function Documentation

6.674.3.1 virtual void activemq::transport::tcp::TcpTransport::close () throw (decaf::io::IOException) [virtual]

Delegates to the superclass and then closes the socket.

Exceptions:

IOException if errors occur.

Reimplemented from **activemq::transport::TransportFilter** (p. 3283).

6.674.3.2 virtual bool activemq::transport::tcp::TcpTransport::isClosed () const [inline, virtual]

Has the **Transport** (p. 3273) been shutdown and no longer usable.

Returns:

true if the **Transport** (p. 3273)

Reimplemented from **activemq::transport::TransportFilter** (p. 3284).

6.674.3.3 virtual bool activemq::transport::tcp::TcpTransport::isConnected () const [inline, virtual]

Is the **Transport** (p. 3273) Connected to its Broker.

Returns:

true if a connection has been made.

Reimplemented from **activemq::transport::TransportFilter** (p. 3284).

6.674.3.4 virtual bool activemq::transport::tcp::TcpTransport::isFaultTolerant () const [inline, virtual]

Is this **Transport** (p. 3273) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns:

true if the **Transport** (p. 3273) is fault tolerant.

Reimplemented from **activemq::transport::TransportFilter** (p. 3284).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/tcp/**TcpTransport.h**

6.675 activemq::transport::tcp::TcpTransportFactory Class Reference

Factory Responsible for creating the **TcpTransport** (p. 3160).

`#include <src/main/activemq/transport/tcp/TcpTransportFactory.h>`Inheritance diagram for activemq::transport::tcp::TcpTransportFactory:

Public Member Functions

- virtual ~**TcpTransportFactory** ()
- virtual **Pointer**< **Transport** > **create** (const **decaf::net::URI** &location) throw (exceptions::ActiveMQException)

  *Creates a fully configured **Transport** (p. 3273) instance which could be a chain of filters and transports.*

- virtual **Pointer**< **Transport** > **createComposite** (const **decaf::net::URI** &location) throw (exceptions::ActiveMQException)

  *Creates a slimed down **Transport** (p. 3273) instance which can be used in composite transport instances.*

Protected Member Functions

- virtual **Pointer**< **Transport** > **doCreateComposite** (const **decaf::net::URI** &location, const **Pointer**< **wireformat::WireFormat** > &wireFormat, const **decaf::util::Properties** &properties) throw (exceptions::ActiveMQException)

  *Creates a slimed down **Transport** (p. 3273) instance which can be used in composite transport instances.*

6.675.1 Detailed Description

Factory Responsible for creating the **TcpTransport** (p. 3160).

6.675.2 Constructor & Destructor Documentation

6.675.2.1 virtual activemq::transport::tcp::TcpTransportFactory::~TcpTransportFactory () [inline, virtual]

6.675.3 Member Function Documentation

6.675.3.1 virtual Pointer<Transport> activemq::transport::tcp::TcpTransportFactory::create (const decaf::net::URI & *location*) throw (exceptions::ActiveMQException) [virtual]

Creates a fully configured **Transport** (p. 3273) instance which could be a chain of filters and transports.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQexception if an error occurs

Implements **activemq::transport::TransportFactory** (p. 3279).

6.675.3.2 virtual Pointer<Transport> activemq::transport::tcp::TcpTransportFactory::createComposite (const decaf::net::URI & *location*) throw (exceptions::ActiveMQException) [virtual]

Creates a slimed down **Transport** (p. 3273) instance which can be used in composite transport instances.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQexception if an error occurs

Implements **activemq::transport::TransportFactory** (p. 3280).

6.675.3.3 virtual Pointer<Transport> activemq::transport::tcp::TcpTransportFactory::doCreateComposite (const decaf::net::URI & *location*, const Pointer< wireformat::WireFormat > & *wireFormat*, const decaf::util::Properties & *properties*) throw (exceptions::ActiveMQException) [protected, virtual]

Creates a slimed down **Transport** (p. 3273) instance which can be used in composite transport instances.

Parameters:

location - URI location to connect to.

wireFormat - the assigned WireFormat for the new **Transport** (p. 3273).

properties - Properties to apply to the transport.

Returns:

new Pointer to a **TcpTransport** (p. 3160).

Exceptions:

ActiveMQexception if an error occurs

The documentation for this class was generated from the following file:

- src/main/activemq/transport/tcp/**TcpTransportFactory.h**

6.676 cms::TemporaryQueue Class Reference

Defines a Temporary **Queue** (p. 2674) based **Destination** (p. 1480).

`#include <src/main/cms/TemporaryQueue.h>`Inheritance diagram for cms::TemporaryQueue:

Public Member Functions

- virtual ~**TemporaryQueue** ()
- virtual std::string **getQueueName** () const =0 throw (CMSException)

  Gets the name of this queue.

- virtual void **destroy** ()=0 throw (CMSException)

  *Destroy's the Temporary **Destination** (p. 1480) at the Provider.*

6.676.1 Detailed Description

Defines a Temporary **Queue** (p. 2674) based **Destination** (p. 1480). A **TemporaryQueue** (p. 3166) is a special type of **Queue** (p. 2674) **Destination** (p. 1480) that can only be consumed from the **Connection** (p. 1131) which created it. TemporaryQueues are most commonly used as the reply to address for Message's that implement the request response pattern.

A **TemporaryQueue** (p. 3166) is guaranteed to exist at the Provider only for the lifetime of the **Connection** (p. 1131) that created it.

Since:

1.0

6.676.2 Constructor & Destructor Documentation

6.676.2.1 virtual cms::TemporaryQueue::~TemporaryQueue () `[inline, virtual]`

6.676.3 Member Function Documentation

6.676.3.1 virtual void cms::TemporaryQueue::destroy () throw (CMSException) `[pure virtual]`

Destroy's the Temporary **Destination** (p. 1480) at the Provider.

Exceptions:

***CMSException** (p. **1031**)* - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQTempQueue** (p. 525).

6.676.3.2 virtual std::string cms::TemporaryQueue::getQueueName () const throw (CMSException) [pure virtual]

Gets the name of this queue.

Returns:

The queue name.

Exceptions:

CMSException *(*p. ***1031)*** - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQTempQueue** (p. 526).

The documentation for this class was generated from the following file:

- src/main/cms/**TemporaryQueue.h**

6.677 cms::TemporaryTopic Class Reference

Defines a Temporary **Topic** (p. 3215) based **Destination** (p. 1480).

`#include <src/main/cms/TemporaryTopic.h>`Inheritance diagram for cms::TemporaryTopic:

Public Member Functions

- virtual ~**TemporaryTopic** ()
- virtual std::string **getTopicName** () const =0 throw (CMSException)

  Gets the name of this topic.

- virtual void **destroy** ()=0 throw (CMSException)

  *Destroy's the Temporary **Destination** (p. 1480) at the Provider.*

6.677.1 Detailed Description

Defines a Temporary **Topic** (p. 3215) based **Destination** (p. 1480). A **TemporaryTopic** (p. 3168) is a special type of **Topic** (p. 3215) **Destination** (p. 1480) that can only be consumed from the **Connection** (p. 1131) which created it. TemporaryTopics are most commonly used as the reply to address for Message's that implement the request response pattern.

A **TemporaryTopic** (p. 3168) is guaranteed to exist at the Provider only for the lifetime of the **Connection** (p. 1131) that created it.

Since:

1.0

6.677.2 Constructor & Destructor Documentation

6.677.2.1 virtual cms::TemporaryTopic::~TemporaryTopic () [inline, virtual]

6.677.3 Member Function Documentation

6.677.3.1 virtual void cms::TemporaryTopic::destroy () throw (CMSException) [pure virtual]

Destroy's the Temporary **Destination** (p. 1480) at the Provider.

Exceptions:

***CMSException** (p. **1031**)*

Implemented in **activemq::commands::ActiveMQTempTopic** (p. 550).

6.677.3.2 virtual std::string cms::TemporaryTopic::getTopicName () const throw (CMSException) [pure virtual]

Gets the name of this topic.

Returns:

The topic name.

Exceptions:

CMSException *(*p. ***1031)*** - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQTempTopic** (p. 551).

The documentation for this class was generated from the following file:

- src/main/cms/**TemporaryTopic.h**

6.678 cms::TextMessage Class Reference

Interface for a text message.

`#include <src/main/cms/TextMessage.h>`Inheritance diagram for cms::TextMessage:

Public Member Functions

- virtual ~**TextMessage** ()
- virtual std::string **getText** () const =0 throw (cms::CMSException)

  Gets the message character buffer.

- virtual void **setText** (const char *msg)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Sets the message contents, does not take ownership of the passed char, but copies it instead.*

- virtual void **setText** (const std::string &msg)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Sets the message contents.

6.678.1 Detailed Description

Interface for a text message. A **TextMessage** (p. 3170) can contain any Text based pay load such as an XML Document or other Text based document.

Like all Messages, a **TextMessage** (p. 3170) is received in Read-Only mode, any attempt to write to the **Message** (p. 2163) will result in a MessageNotWritableException being thrown until the `clearBody` method is called which will erase the contents and place the message back in a read / write mode.

Since:

1.0

6.678.2 Constructor & Destructor Documentation

6.678.2.1 virtual cms::TextMessage::~TextMessage () `[inline, virtual]`

6.678.3 Member Function Documentation

6.678.3.1 virtual std::string cms::TextMessage::getText () const throw (cms::CMSException) `[pure virtual]`

Gets the message character buffer.

Returns:

The message character buffer.

Exceptions:

CMSException *(*p. ***1031***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQTextMessage** (p. 576).

6.678.3.2 virtual void cms::TextMessage::setText (const std::string & *msg*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Sets the message contents.

Parameters:

msg The message buffer.

Exceptions:

CMSException *(*p. ***1031***) - if an internal error occurs.

MessageNotWriteableException *(*p. ***2331***) - if the message is in read-only mode..

Implemented in **activemq::commands::ActiveMQTextMessage** (p. 576).

6.678.3.3 virtual void cms::TextMessage::setText (const char * *msg*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Sets the message contents, does not take ownership of the passed char*, but copies it instead.

Parameters:

msg The message buffer.

Exceptions:

CMSException *(*p. ***1031***) - if an internal error occurs.

MessageNotWriteableException *(*p. ***2331***) - if the message is in read-only mode..

Implemented in **activemq::commands::ActiveMQTextMessage** (p. 576).

The documentation for this class was generated from the following file:

6.679 decaf::util::concurrent::ThreadFactory Class Reference

public interface **ThreadFactory** (p. 3172)

`#include <src/main/decaf/util/concurrent/ThreadFactory.h>`

Public Member Functions

- virtual ~**ThreadFactory** ()
- virtual decaf::lang::Thread * **newThread** (**decaf::lang::Runnable** *r)=0

  Constructs a new Thread.

6.679.1 Detailed Description

public interface **ThreadFactory** (p. 3172) An object that creates new threads on demand. Using thread factories removes hardwiring of calls to new Thread, enabling applications to use special thread subclasses, priorities, etc.

The simplest implementation of this interface is just:

class SimpleThreadFactory : public **ThreadFactory** (p. 3172) { public: Thread* newThread(Runnable* r) { return new Thread(r); } }

The Executors.defaultThreadFactory() method provides a more useful simple implementation, that sets the created thread context to known values before returning it.

Since:

1.0

6.679.2 Constructor & Destructor Documentation

6.679.2.1 virtual decaf::util::concurrent::ThreadFactory::~ThreadFactory () [inline, virtual]

6.679.3 Member Function Documentation

6.679.3.1 virtual decaf::lang::Thread* decaf::util::concurrent::ThreadFactory::newThread (decaf::lang::Runnable * *r*) [pure virtual]

Constructs a new Thread. Implementations may also initialize priority, name, daemon status, ThreadGroup, etc. The pointer passed is still owned by the caller and is not deleted by the Thread object. The caller owns the returned Thread object and must delete it when finished.

Parameters:

r A pointer to a Runnable instance to be executed by new Thread instance returned.

Returns:

constructed thread, or NULL if the request to create a thread is rejected the caller owns the returned pointer.

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**ThreadFactory.h**

6.680 decaf::lang::ThreadGroup Class Reference

`#include <src/main/decaf/lang/ThreadGroup.h>`

Public Member Functions

- **ThreadGroup** ()
- virtual ~**ThreadGroup** ()

6.680.1 Detailed Description

Since:

1.0

6.680.2 Constructor & Destructor Documentation

6.680.2.1 decaf::lang::ThreadGroup::ThreadGroup ()

6.680.2.2 virtual decaf::lang::ThreadGroup::~ThreadGroup () [virtual]

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**ThreadGroup.h**

6.681 decaf::util::concurrent::ThreadPool Class Reference

Defines a Thread Pool object that implements the functionality of pooling threads to perform user tasks.

`#include <src/main/decaf/util/concurrent/ThreadPool.h>`Inheritance diagram for decaf::util::concurrent::ThreadPool:

Public Types

- typedef std::pair< **lang::Runnable** *, **TaskListener** * > **Task**

Public Member Functions

- **ThreadPool** ()
- virtual ~**ThreadPool** ()
- virtual void **queueTask** (**Task** task) throw (lang::Exception)

  Queue *(*p. 2671*) a task to be completed by one of the Pooled Threads.*

- virtual **Task deQueueTask** () throw (lang::Exception)

  DeQueue a task to be completed by one of the Pooled Threads.

- virtual std::size_t **getPoolSize** () const

  Returns the current number of Threads in the Pool, this is how many there are now, not how many are active or the max number that might exist.

- virtual std::size_t **getBacklog** () const

  Returns the current backlog of items in the tasks queue, this is how much work is still waiting to get done.

- virtual void **reserve** (std::size_t size)

  Ensures that there is at least the specified number of Threads allocated to the pool.

- virtual std::size_t **getMaxThreads** () const

  Get the Max Number of Threads this Pool can contain.

- virtual void **setMaxThreads** (std::size_t maxThreads)

  Sets the Max number of threads this pool can contian.

- virtual std::size_t **getBlockSize** () const

  Gets the Max number of threads that can be allocated at a time when new threads are needed.

- virtual void **setBlockSize** (std::size_t blockSize)

  Sets the Max number of Threads that can be allocated at a time when the Thread Pool determines that more Threads are needed.

- virtual std::size_t **getFreeThreadCount** () const

  Returns the current number of available threads in the pool, threads that are performing a user task are considered unavailable.

- virtual void **onTaskStarted** (**PooledThread** *thread)

  Called by a pooled thread when it is about to begin executing a new task.

- virtual void **onTaskCompleted** (**PooledThread** *thread)

  Called by a pooled thread when it has completed a task and is going back to waiting for another task to run, this will increment the free threads counter.

- virtual void **onTaskException** (**PooledThread** *thread, **lang::Exception** &ex)

  *Called by a pooled thread when it has encountered an exception while running a user task, after receiving this notification the callee should assume that the **PooledThread** (p. 2518) is now no longer running.*

Static Public Member Functions

- static **ThreadPool** * **getInstance** ()

  Return the one and only Thread Pool instance.

Static Public Attributes

- static const size_t **DEFAULT_MAX_POOL_SIZE** = 10
- static const size_t **DEFAULT_MAX_BLOCK_SIZE** = 3

6.681.1 Detailed Description

Defines a Thread Pool object that implements the functionality of pooling threads to perform user tasks. The Thread Poll has max size that it will grow to. The thread pool allocates threads in blocks. When there are no waiting worker threads and a task is queued then a new batch is allocated. The user can specify the size of the blocks, otherwise a default value is used.

When the user queues a task they must also queue a listener to be notified when the task has completed, this provides the user with a mechanism to know when a task object can be freed.

To have the Thread Pool perform a task, the user enqueue's an object that implements the `Runnable` interface and one of the worker threads will executing it in its thread context.

6.681.2 Member Typedef Documentation

6.681.2.1 typedef std::pair<lang::Runnable*, TaskListener*> decaf::util::concurrent::ThreadPool::Task

6.681.3 Constructor & Destructor Documentation

6.681.3.1 decaf::util::concurrent::ThreadPool::ThreadPool ()

6.681.3.2 virtual decaf::util::concurrent::ThreadPool::~ThreadPool () [virtual]

6.681.4 Member Function Documentation

6.681.4.1 virtual Task decaf::util::concurrent::ThreadPool::deQueueTask () throw (lang::Exception) [virtual]

DeQueue a task to be completed by one of the Pooled Threads. A caller of this method will block until there is something in the tasks queue, therefore care must be taken when calling this function. Normally clients of **ThreadPool** (p. 3175) don't use this, only the `PooledThread` (p. 2518) objects owned by this **ThreadPool** (p. 3175).

Returns:

object that derives from Runnable

Exceptions:

ActiveMQException

6.681.4.2 virtual std::size_t decaf::util::concurrent::ThreadPool::getBacklog () const [inline, virtual]

Returns the current backlog of items in the tasks queue, this is how much work is still waiting to get done.

Returns:

number of outstanding tasks.

6.681.4.3 virtual std::size_t decaf::util::concurrent::ThreadPool::getBlockSize () const [inline, virtual]

Gets the Max number of threads that can be allocated at a time when new threads are needed.

Returns:

max Thread Block Size

6.681.4.4 virtual std::size_t decaf::util::concurrent::ThreadPool::getFreeThreadCount () const [inline, virtual]

Returns the current number of available threads in the pool, threads that are performing a user task are considered unavailable. This value could change immediately after calling as Threads

could finish right after and be available again. This is informational only.

Returns:

total free threads

6.681.4.5 static ThreadPool* decaf::util::concurrent::ThreadPool::getInstance () [static]

Return the one and only Thread Pool instance.

Returns:

The Thread Pool Pointer

6.681.4.6 virtual std::size_t decaf::util::concurrent::ThreadPool::getMaxThreads () const [inline, virtual]

Get the Max Number of Threads this Pool can contain.

Returns:

max size

6.681.4.7 virtual std::size_t decaf::util::concurrent::ThreadPool::getPoolSize () const [inline, virtual]

Returns the current number of Threads in the Pool, this is how many there are now, not how many are active or the max number that might exist.

Returns:

integer number of threads in existence.

6.681.4.8 virtual void decaf::util::concurrent::ThreadPool::onTaskCompleted (PooledThread * *thread*) [virtual]

Called by a pooled thread when it has completed a task and is going back to waiting for another task to run, this will increment the free threads counter.

Parameters:

thread Pointer the the Pooled Thread that is making this call.

Implements **decaf::util::concurrent::PooledThreadListener** (p. 2520).

6.681.4.9 virtual void decaf::util::concurrent::ThreadPool::onTaskException (PooledThread * *thread*, lang::Exception & *ex*) [virtual]

Called by a pooled thread when it has encountered an exception while running a user task, after receiving this notification the callee should assume that the **PooledThread** (p. 2518) is now no longer running.

Parameters:

thread Pointer to the Pooled Thread that is making this call

ex The Exception that occurred.

Implements **decaf::util::concurrent::PooledThreadListener** (p. 2521).

6.681.4.10 virtual void decaf::util::concurrent::ThreadPool::onTaskStarted (PooledThread * *thread*) [virtual]

Called by a pooled thread when it is about to begin executing a new task. This will decrement the available threads counter so that this object knows when there are no more free threads and must create new ones.

Parameters:

thread Pointer to the Pooled Thread that is making this call

Implements **decaf::util::concurrent::PooledThreadListener** (p. 2521).

6.681.4.11 virtual void decaf::util::concurrent::ThreadPool::queueTask (Task *task*) throw (lang::Exception) [virtual]

Queue (p. 2671) a task to be completed by one of the Pooled Threads. tasks are serviced as soon as a `PooledThread` (p. 2518) is available to run it.

Parameters:

task object that derives from Runnable

Exceptions:

ActiveMQException

6.681.4.12 virtual void decaf::util::concurrent::ThreadPool::reserve (std::size_t *size*) [virtual]

Ensures that there is at least the specified number of Threads allocated to the pool. If the size is greater than the MAX number of threads in the pool, then only MAX threads are reservved. If the size is smaller than the number of threads currently in the pool, than nothing is done.

Parameters:

size the number of threads to reserve.

6.681.4.13 virtual void decaf::util::concurrent::ThreadPool::setBlockSize (std::size_t *blockSize*) [virtual]

Sets the Max number of Threads that can be allocated at a time when the Thread Pool determines that more Threads are needed.

Parameters:

blockSize Max Thread Block Size

6.681.4.14 virtual void decaf::util::concurrent::ThreadPool::setMaxThreads (std::size_t *maxThreads*) [virtual]

Sets the Max number of threads this pool can contian. if this value is smaller than the current size of the pool nothing is done.

Parameters:

maxThreads total number of threads that can be pooled

6.681.5 Field Documentation

6.681.5.1 const size_t decaf::util::concurrent::ThreadPool::DEFAULT_MAX_BLOCK_SIZE = 3 [static]

6.681.5.2 const size_t decaf::util::concurrent::ThreadPool::DEFAULT_MAX_POOL_SIZE = 10 [static]

6.682 decaf::lang::Throwable Class Reference

This class represents an error that has occurred.

`#include <src/main/decaf/lang/Throwable.h>`Inheritance diagram for decaf::lang::Throwable:

Public Member Functions

- **Throwable** () throw ()
- virtual ~**Throwable** () throw ()
- virtual std::string **getMessage** () const =0

  Gets the cause of the error, if no message was provided to the instance of this interface but a cause was then the value cause.getMessage is then returned.

- virtual const std::exception * **getCause** () const =0

  Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.

- virtual void **initCause** (const std::exception *cause)=0

  Initializes the contained cause exception with the one given.

- virtual void **setMark** (const char *file, const int lineNumber)=0

  Adds a file/line number to the stack trace.

- virtual **Throwable** * **clone** () const =0

  Clones this exception.

- virtual std::vector< std::pair< std::string, int > > **getStackTrace** () const =0

  Provides the stack trace for every point where this exception was caught, marked, and rethrown.

- virtual void **printStackTrace** () const =0

  Prints the stack trace to std::err.

- virtual void **printStackTrace** (std::ostream &stream) const =0

  Prints the stack trace to the given output stream.

- virtual std::string **getStackTraceString** () const =0

  Gets the stack trace as one contiguous string.

6.682.1 Detailed Description

This class represents an error that has occurred. All Exceptions in the Decaf library should extend from this or from the **Exception** (p. 1574) class in order to ensure that all Decaf Exceptions are interchangeable with the std::exception class.

Throwable (p. 3181) can wrap another **Throwable** (p. 3181) as the cause if the error being thrown. The user can inspect the cause by calling `getCause`, the pointer returned is the property of the **Throwable** (p. 3181) instance and will be deleted when it is deleted or goes out of scope.

Since:

1.0

6.682.2 Constructor & Destructor Documentation

6.682.2.1 decaf::lang::Throwable::Throwable () throw () [inline]

6.682.2.2 virtual decaf::lang::Throwable::~Throwable () throw () [inline, virtual]

6.682.3 Member Function Documentation

6.682.3.1 virtual Throwable* decaf::lang::Throwable::clone () const [pure virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

Copy of this **Exception** (p. 1574) object

Implemented in **activemq::exceptions::ActiveMQException** (p. 306), **activemq::exceptions::BrokerException** (p. 749), **decaf::io::EOFException** (p. 1573), **decaf::io::InterruptedIOException** (p. 1807), **decaf::io::IOException** (p. 1822), **decaf::io::UnsupportedEncodingException** (p. 3302), **decaf::io::UTFDataFormatException** (p. 3355), **decaf::lang::Exception** (p. 1577), **decaf::lang::exceptions::ClassCastException** (p. 1018), **decaf::lang::exceptions::IllegalArgumentException** (p. 1722), **decaf::lang::exceptions::IllegalMonitorStateException** (p. 1725), **decaf::lang::exceptions::IllegalStateException** (p. 1728), **decaf::lang::exceptions::IllegalThreadStateException** (p. 1732), **decaf::lang::exceptions::IndexOutOfBoundsException** (p. 1739), **decaf::lang::exceptions::InterruptedException** (p. 1804), **decaf::lang::exceptions::InvalidStateException** (p. 1819), **decaf::lang::exceptions::NoSuchElementException** (p. 2425), **decaf::lang::exceptions::NullPointerException** (p. 2431), **decaf::lang::exceptions::NumberFormatException** (p. 2437), **decaf::lang::exceptions::RuntimeException** (p. 2821), **decaf::lang::exceptions::UnsupportedOperationException** (p. 3307), **decaf::net::BindException** (p. 723), **decaf::net::ConnectException** (p. 1130), **decaf::net::HttpRetryException** (p. 1719), **decaf::net::MalformedURLException** (p. 2093), **decaf::net::NoRouteToHostException** (p. 2419), **decaf::net::PortUnreachableException** (p. 2524), **decaf::net::ProtocolException** (p. 2669), **decaf::net::SocketException** (p. 2973), **decaf::net::SocketTimeoutException** (p. 2992), **decaf::net::UnknownHostException** (p. 3296), **decaf::net::UnknownServiceException** (p. 3299), **decaf::net::URISyntaxException** (p. 3337), **decaf::nio::BufferOverflowException** (p. 836), **decaf::nio::BufferUnderflowException** (p. 839), **decaf::nio::InvalidMarkException** (p. 1815), **decaf::nio::ReadOnlyBufferException** (p. 2687), **decaf::util::concurrent::BrokenBarrierException** (p. 744),

decaf::util::concurrent::CancellationException (p. 967), **decaf::util::concurrent::ExecutionException** (p. 1607), **decaf::util::concurrent::RejectedExecutionException** (p. 2701), and **decaf::util::concurrent::TimeoutException** (p. 3187).

6.682.3.2 virtual const std::exception* decaf::lang::Throwable::getCause () const [pure virtual]

Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.

Returns:

a const pointer reference to the causal exception, if there was no cause associated with this exception then NULL is returned.

Implemented in **decaf::lang::Exception** (p. 1577).

6.682.3.3 virtual std::string decaf::lang::Throwable::getMessage () const [pure virtual]

Gets the cause of the error, if no message was provided to the instance of this interface but a cause was then the value cause.getMessage is then returned.

Returns:

string errors message

Implemented in **decaf::lang::Exception** (p. 1578).

6.682.3.4 virtual std::vector< std::pair< std::string, int> > decaf::lang::Throwable::getStackTrace () const [pure virtual]

Provides the stack trace for every point where this exception was caught, marked, and rethrown.

Returns:

vector containing stack trace strings

Implemented in **decaf::lang::Exception** (p. 1578).

6.682.3.5 virtual std::string decaf::lang::Throwable::getStackTraceString () const [pure virtual]

Gets the stack trace as one contiguous string.

Returns:

string with formatted stack trace data

Implemented in **decaf::lang::Exception** (p. 1578).

6.682.3.6 virtual void decaf::lang::Throwable::initCause (const std::exception * *cause*) [pure virtual]

Initializes the contained cause exception with the one given. A copy is made to avoid ownership issues.

Parameters:

cause The exception that was the cause of this one.

Implemented in **decaf::lang::Exception** (p. 1578).

6.682.3.7 virtual void decaf::lang::Throwable::printStackTrace (std::ostream & *stream*) const [pure virtual]

Prints the stack trace to the given output stream.

Parameters:

stream the target output stream.

Implemented in **decaf::lang::Exception** (p. 1579).

6.682.3.8 virtual void decaf::lang::Throwable::printStackTrace () const [pure virtual]

Prints the stack trace to std::err.

Implemented in **decaf::lang::Exception** (p. 1579).

6.682.3.9 virtual void decaf::lang::Throwable::setMark (const char * *file*, const int *lineNumber*) [pure virtual]

Adds a file/line number to the stack trace.

Parameters:

file The name of the file calling this method (use __FILE__).

lineNumber The line number in the calling file (use __LINE__).

Implemented in **decaf::lang::Exception** (p. 1579).

- **TimeoutException** (const char ∗file, const int lineNumber, const std::exception ∗**cause**, const char ∗msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **TimeoutException** ∗ **clone** () const
  Clones this exception.
- virtual ∼**TimeoutException** () throw ()

6.683.1 Constructor & Destructor Documentation

6.683.1.1 decaf::util::concurrent::TimeoutException::TimeoutException () throw () [inline]

Default Constructor.

6.683.1.2 decaf::util::concurrent::TimeoutException::TimeoutException (const decaf::lang::Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.683.1.3 decaf::util::concurrent::TimeoutException::TimeoutException (const TimeoutException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex The exception to copy from.

References decaf::lang::Exception::Exception().

6.683.1.4 decaf::util::concurrent::TimeoutException::TimeoutException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.683.1.5 decaf::util::concurrent::TimeoutException::TimeoutException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The string message to report

... list of primitives that are formatted into the message

6.683.1.6 decaf::util::concurrent::TimeoutException::TimeoutException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The string message to report

... list of primitives that are formatted into the message

6.683.1.7 virtual decaf::util::concurrent::TimeoutException::~TimeoutException () throw () [inline, virtual]

6.683.2 Member Function Documentation

6.683.2.1 virtual TimeoutException* decaf::util::concurrent::TimeoutException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new **TimeoutException** (p. 3185) that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1577).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**TimeoutException.h**

6.684 decaf::util::Timer Class Reference

A facility for threads to schedule tasks for future execution in a background thread.

`#include <src/main/decaf/util/Timer.h>`

Public Member Functions

- **Timer** ()
- virtual ~**Timer** ()
- void **cancel** ()

  Terminates this timer, discarding any currently scheduled tasks.

- std::size_t **purge** ()

  Removes all canceled tasks from this timer's task queue.

- void **schedule** (**TimerTask** *task, long long delay) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

  Schedules the specified task for execution after the specified delay.

- void **schedule** (const **decaf::lang::Pointer**< **TimerTask** > &task, long long delay) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

  Schedules the specified task for execution after the specified delay.

- void **schedule** (**TimerTask** *task, const **Date** &time) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

  Schedules the specified task for execution at the specified time.

- void **schedule** (const **decaf::lang::Pointer**< **TimerTask** > &task, const **Date** &time) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

  Schedules the specified task for execution at the specified time.

- void **schedule** (**TimerTask** *task, long long delay, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

  Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay.

- void **schedule** (const **decaf::lang::Pointer**< **TimerTask** > &task, long long delay, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

  Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay.

- void **schedule** (**TimerTask** *task, const **Date** &firstTime, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

  Schedules the specified task for repeated fixed-delay execution, beginning at the specified time.

- void **schedule** (const **decaf::lang::Pointer**< **TimerTask** > &task, const **Date** &firstTime, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

  Schedules the specified task for repeated fixed-delay execution, beginning at the specified time.

- void **scheduleAtFixedRate** (**TimerTask** *task, long long delay, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

  Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay.

- void **scheduleAtFixedRate** (const **decaf::lang::Pointer**< **TimerTask** > &task, long long delay, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

  Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay.

- void **scheduleAtFixedRate** (**TimerTask** *task, const **Date** &firstTime, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

  Schedules the specified task for repeated fixed-rate execution, beginning at the specified time.

- void **scheduleAtFixedRate** (const **decaf::lang::Pointer**< **TimerTask** > &task, const **Date** &firstTime, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

  Schedules the specified task for repeated fixed-rate execution, beginning at the specified time.

6.684.1 Detailed Description

A facility for threads to schedule tasks for future execution in a background thread. Tasks may be scheduled for one-time execution, or for repeated execution at regular intervals.

Corresponding to each **Timer** (p. 3188) object is a single background thread that is used to execute all of the timer's tasks, sequentially. **Timer** (p. 3188) tasks should complete quickly. If a timer task takes excessive time to complete, it "hogs" the timer's task execution thread. This can, in turn, delay the execution of subsequent tasks, which may "bunch up" and execute in rapid succession when (and if) the offending task finally completes.

This class is thread-safe: multiple threads can share a single **Timer** (p. 3188) object without the need for external synchronization.

This class does not offer real-time guarantees: it schedules tasks using the wait(long) method.

Since:

1.0

6.684.2 Constructor & Destructor Documentation

6.684.2.1 decaf::util::Timer::Timer ()

6.684.2.2 virtual decaf::util::Timer::~Timer () [virtual]

6.684.3 Member Function Documentation

6.684.3.1 void decaf::util::Timer::cancel ()

Terminates this timer, discarding any currently scheduled tasks. Does not interfere with a currently executing task (if it exists). Once a timer has been terminated, its execution thread terminates gracefully, and no more tasks may be scheduled on it.

Note that calling this method from within the run method of a timer task that was invoked by this timer absolutely guarantees that the ongoing task execution is the last task execution that will ever be performed by this timer.

This method may be called repeatedly; the second and subsequent calls have no effect.

6.684.3.2 std::size_t decaf::util::Timer::purge ()

Removes all canceled tasks from this timer's task queue. Calling this method has no effect on the behavior of the timer, but eliminates the canceled tasks from the queue causing the **Timer** (p. 3188) to destroy the **TimerTask** (p. 3199) pointer it was originally given, the caller should ensure that they no longer have any references to TimerTasks that were previously scheduled.

Most programs will have no need to call this method. It is designed for use by the rare application that cancels a large number of tasks. Calling this method trades time for space: the runtime of the method may be proportional to n + c log n, where n is the number of tasks in the queue and c is the number of canceled tasks.

This method can be called on a **Timer** (p. 3188) object that has no scheduled tasks without error.

Returns:

the number of tasks removed from the queue.

6.684.3.3 void decaf::util::Timer::schedule (const decaf::lang::Pointer< TimerTask > & *task*, const Date & *firstTime*, long long *period*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for repeated fixed-delay execution, beginning at the specified time. Subsequent executions take place at approximately regular intervals separated by the specified period.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity),

subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying Object.wait(long long) is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters:

task - task to be scheduled.

firstTime - First time at which task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3199) value is Null.

IllegalArgumentException - if time.getTime() is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

6.684.3.4 void decaf::util::Timer::schedule (TimerTask * *task*, const Date & *firstTime*, long long *period*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for repeated fixed-delay execution, beginning at the specified time. Subsequent executions take place at approximately regular intervals separated by the specified period.

The **TimerTask** (p. 3199) pointer is considered to be owned by the **Timer** (p. 3188) class once it has been scheduled, the **Timer** (p. 3188) will destroy its TimerTask's once they have been cancelled or the **Timer** (p. 3188) itself is cancelled. A **TimerTask** (p. 3199) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3188) and the caller should ensure that the **TimerTask** (p. 3199) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3199) instance are planned.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying Object.wait(long long) is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters:

task - task to be scheduled.

firstTime - First time at which task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3199) value is Null.

IllegalArgumentException - if time.getTime() is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

6.684.3.5 void decaf::util::Timer::schedule (const decaf::lang::Pointer< TimerTask > & *task*, long long *delay*, long long *period*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay. Subsequent executions take place at approximately regular intervals separated by the specified period.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying Object.wait(long long) is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters:

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3199) value is Null.

IllegalArgumentException - if delay is negative, or delay + System.currentTimeMillis() is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

6.684.3.6 void decaf::util::Timer::schedule (TimerTask * *task*, long long *delay*, long long *period*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay. Subsequent executions take place at approximately regular intervals separated by the specified

period.

The **TimerTask** (p. 3199) pointer is considered to be owned by the **Timer** (p. 3188) class once it has been scheduled, the **Timer** (p. 3188) will destroy its TimerTask's once they have been cancelled or the **Timer** (p. 3188) itself is cancelled. A **TimerTask** (p. 3199) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3188) and the caller should ensure that the **TimerTask** (p. 3199) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3199) instance are planned.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying Object.wait(long long) is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters:

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3199) value is Null.

IllegalArgumentException - if delay is negative, or delay + System.currentTimeMillis() is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

6.684.3.7 void decaf::util::Timer::schedule (const decaf::lang::Pointer< TimerTask > & *task*, const Date & *time*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for execution at the specified time. If the time is in the past, the task is scheduled for immediate execution.

Parameters:

task - task to be scheduled.

time - time at which task is to be executed.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3199) value is Null.

IllegalArgumentException - if time.getTime() is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

6.684.3.8 void decaf::util::Timer::schedule (TimerTask * *task*, const Date & *time*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for execution at the specified time. If the time is in the past, the task is scheduled for immediate execution.

The **TimerTask** (p. 3199) pointer is considered to be owned by the **Timer** (p. 3188) class once it has been scheduled, the **Timer** (p. 3188) will destroy its TimerTask's once they have been cancelled or the **Timer** (p. 3188) itself is cancelled. A **TimerTask** (p. 3199) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3188) and the caller should ensure that the **TimerTask** (p. 3199) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3199) instance are planned.

Parameters:

task - task to be scheduled.

time - time at which task is to be executed.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3199) value is Null.

IllegalArgumentException - if time.getTime() is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

6.684.3.9 void decaf::util::Timer::schedule (const decaf::lang::Pointer< TimerTask > & *task*, long long *delay*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for execution after the specified delay.

Parameters:

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3199) value is Null.

IllegalArgumentException - if delay is negative, or delay + System.currentTimeMillis() is negative.

IllegalStateException - if task was already scheduled or cancelled, or timer was cancelled.

6.684.3.10 void decaf::util::Timer::schedule (TimerTask * *task*, long long *delay*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for execution after the specified delay. The **TimerTask** (p. 3199) pointer is considered to be owned by the **Timer** (p. 3188) class once it has been scheduled, the **Timer** (p. 3188) will destroy its TimerTask's once they have been cancelled or the **Timer** (p. 3188) itself is cancelled. A **TimerTask** (p. 3199) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3188) and the caller should ensure that the **TimerTask** (p. 3199) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3199) instance are planned.

Parameters:

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3199) value is Null.

IllegalArgumentException - if delay is negative, or delay + System.currentTimeMillis() is negative.

IllegalStateException - if task was already scheduled or cancelled, or timer was cancelled.

6.684.3.11 void decaf::util::Timer::scheduleAtFixedRate (const decaf::lang::Pointer< TimerTask > & *task*, const Date & *firstTime*, long long *period*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for repeated fixed-rate execution, beginning at the specified time. Subsequent executions take place at approximately regular intervals, separated by the specified period.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying Object.wait(long) is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters:

task - task to be scheduled.

firstTime - First time at which task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3199) value is Null.

IllegalArgumentException - if time.getTime() is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

6.684.3.12 void decaf::util::Timer::scheduleAtFixedRate (TimerTask * *task*, const Date & *firstTime*, long long *period*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for repeated fixed-rate execution, beginning at the specified time. Subsequent executions take place at approximately regular intervals, separated by the specified period.

The **TimerTask** (p. 3199) pointer is considered to be owned by the **Timer** (p. 3188) class once it has been scheduled, the **Timer** (p. 3188) will destroy its TimerTask's once they have been cancelled or the **Timer** (p. 3188) itself is cancelled. A **TimerTask** (p. 3199) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3188) and the caller should ensure that the **TimerTask** (p. 3199) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3199) instance are planned.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying Object.wait(long) is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters:

task - task to be scheduled.

firstTime - First time at which task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3199) value is Null.

IllegalArgumentException - if time.getTime() is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

6.684.3.13 void decaf::util::Timer::scheduleAtFixedRate (const decaf::lang::Pointer< TimerTask > & *task*, long long *delay*, long long *period*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay. Subsequent executions take place at approximately regular intervals, separated by the specified period.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying Object.wait(long) is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters:

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3199) value is Null.

IllegalArgumentException - if delay is negative, or delay + System.currentTimeMillis() is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

6.684.3.14 void decaf::util::Timer::scheduleAtFixedRate (TimerTask * *task*, long long *delay*, long long *period*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay. Subsequent executions take place at approximately regular intervals, separated by the specified period.

The **TimerTask** (p. 3199) pointer is considered to be owned by the **Timer** (p. 3188) class once it has been scheduled, the **Timer** (p. 3188) will destroy its TimerTask's once they have been cancelled or the **Timer** (p. 3188) itself is cancelled. A **TimerTask** (p. 3199) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 3188) and the caller should ensure that the **TimerTask** (p. 3199) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3199) instance are planned.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying Object.wait(long) is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters:

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions:

NullPointerException - if the **TimerTask** (p. 3199) value is Null.

IllegalArgumentException - if delay is negative, or delay + System.currentTimeMillis() is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

- class **decaf::internal::util::TimerTaskHeap**

6.685.1 Detailed Description

A Base class for a task object that can be scheduled for one-time or repeated execution by a **Timer** (p. 3188).

Since:

1.0

6.685.2 Constructor & Destructor Documentation

6.685.2.1 decaf::util::TimerTask::TimerTask ()

6.685.2.2 virtual decaf::util::TimerTask::~TimerTask () [inline, virtual]

6.685.3 Member Function Documentation

6.685.3.1 bool decaf::util::TimerTask::cancel ()

Cancels this timer task. If the task has been scheduled for one-time execution and has not yet run, or has not yet been scheduled, it will never run. If the task has been scheduled for repeated execution, it will never run again. (If the task is running when this call occurs, the task will run to completion, but will never run again.)

Note that calling this method from within the run method of a repeating timer task absolutely guarantees that the timer task will not run again.

This method may be called repeatedly; the second and subsequent calls have no effect.

Returns:

true if this task is scheduled for one-time execution and has not yet run, or this task is scheduled for repeated execution. Returns false if the task was scheduled for one-time execution and has already run, or if the task was never scheduled, or if the task was already canceled. (Loosely speaking, this method returns true if it prevents one or more scheduled executions from taking place.)

6.685.3.2 long long decaf::util::TimerTask::getWhen () const [protected]

6.685.3.3 bool decaf::util::TimerTask::isScheduled () const [protected]

6.685.3.4 long long decaf::util::TimerTask::scheduledExecutionTime () const

Returns the scheduled execution time of the most recent actual execution of this task. (If this method is invoked while task execution is in progress, the return value is the scheduled execution time of the ongoing task execution.)

This method is typically invoked from within a task's run method, to determine whether the current execution of the task is sufficiently timely to warrant performing the scheduled activity:

void **run()** (p. 2816) { if(System::currentTimeMillis() - **scheduledExecutionTime()** (p. 3200) >= MAX_TARDINESS) return; // Too late; skip this execution. // Perform the task }

This method is typically not used in conjunction with fixed-delay execution repeating tasks, as their scheduled execution times are allowed to drift over time, and so are not terribly significant.

Returns:

the time at which the most recent execution of this task was scheduled to occur, in the format returned by **Date.getTime()** (p. 1469). The return value is undefined if the task has yet to commence its first execution.

6.685.3.5 void decaf::util::TimerTask::setScheduledTime (long long *time*) [protected]

6.685.4 Friends And Related Function Documentation

6.685.4.1 friend class decaf::internal::util::TimerTaskHeap [friend]

6.686 decaf::internal::util::TimerTaskHeap Class Reference

A Binary Heap implemented specifically for the Timer class in Decaf Util.

`#include <src/main/decaf/internal/util/TimerTaskHeap.h>`

Public Member Functions

- **TimerTaskHeap** ()
- virtual ~**TimerTaskHeap** ()
- **Pointer< TimerTask > peek** ()

  Peaks at the Head of the Heap, returns the task with the nearest scheduled run time.

- bool **isEmpty** () const
- std::size_t **size** () const
- void **insert** (const **Pointer< TimerTask >** &task)

  Inserts the specified Task into the heap, heap is reordered to reflect the addition of a new element.

- void **remove** (std::size_t pos)

  Removes the Task at the specified position from the heap, resorts the heap from the position down to the bottom.

- void **reset** ()

  Clear all contents from the heap.

- void **adjustMinimum** ()

  Resorts the heap starting at the top.

- std::size_t **deleteIfCancelled** ()

  Runs through the heap removing all cancelled Tasks from it, this is not normally used but in case a a cancellation of a large number of tasks the user can perform this purge.

- std::size_t **find** (const **Pointer< TimerTask >** &task) const

  Searches the heap for the specified TimerTask element and returns its position in the heap.

6.686.1 Detailed Description

A Binary Heap implemented specifically for the Timer class in Decaf Util.

Since:

1.0

6.686.2 Constructor & Destructor Documentation

6.686.2.1 decaf::internal::util::TimerTaskHeap::TimerTaskHeap ()

6.686.2.2 virtual decaf::internal::util::TimerTaskHeap::~TimerTaskHeap () [virtual]

6.686.3 Member Function Documentation

6.686.3.1 void decaf::internal::util::TimerTaskHeap::adjustMinimum ()

Resorts the heap starting at the top.

6.686.3.2 std::size_t decaf::internal::util::TimerTaskHeap::deleteIfCancelled ()

Runs through the heap removing all cancelled Tasks from it, this is not normally used but in case a a cancellation of a large number of tasks the user can perform this purge.

Returns:

the number of task that were removed from the heap becuase they were cancelled.

6.686.3.3 std::size_t decaf::internal::util::TimerTaskHeap::find (const Pointer< TimerTask > & *task*) const

Searches the heap for the specified TimerTask element and returns its position in the heap. Returns the unsigned equivalent of -1 if the element is not found.

Returns:

the position in the Heap where the Task is stored, or npos.

6.686.3.4 void decaf::internal::util::TimerTaskHeap::insert (const Pointer< TimerTask > & *task*)

Inserts the specified Task into the heap, heap is reordered to reflect the addition of a new element.

Parameters:

task The TimerTask to insert into the heap.

6.686.3.5 bool decaf::internal::util::TimerTaskHeap::isEmpty () const

Returns:

true if the heap is empty.

6.686.3.6 Pointer<TimerTask> decaf::internal::util::TimerTaskHeap::peek ()

Peaks at the Head of the Heap, returns the task with the nearest scheduled run time.

Returns:

The TimerTask that is scheduled to be executed next if the Heap is empty a Null Pointer value is returned.

6.686.3.7 void decaf::internal::util::TimerTaskHeap::remove (std::size_t *pos*)

Removes the Task at the specified position from the heap, resorts the heap from the position down to the bottom.

Parameters:

pos The position at which to remove the TimerTask and begin a resort of the heap.

6.686.3.8 void decaf::internal::util::TimerTaskHeap::reset ()

Clear all contents from the heap.

6.686.3.9 std::size_t decaf::internal::util::TimerTaskHeap::size () const

Returns:

the size of the heap.

6.687 decaf::util::concurrent::TimeUnit Class Reference

A **TimeUnit** (p. 3205) represents time durations at a given unit of granularity and provides utility methods to convert across units, and to perform timing and delay operations in these units.

`#include <src/main/decaf/util/concurrent/TimeUnit.h>`Inheritance diagram for decaf::util::concurrent::TimeUnit:

Public Member Functions

- virtual ~**TimeUnit** ()
- long long **convert** (long long sourceDuration, const **TimeUnit** &sourceUnit) const

  Convert the given time duration in the given unit to this unit.

- long long **toNanos** (long long duration) const

  Equivalent to `NANOSECONDS.convert(duration, this)`.

- long long **toMicros** (long long duration) const

  Equivalent to `MICROSECONDS.convert(duration, this)`.

- long long **toMillis** (long long duration) const

  Equivalent to `MILLISECONDS.convert(duration, this)`.

- long long **toSeconds** (long long duration) const

  Equivalent to `SECONDS.convert(duration, this)`.

- long long **toMinutes** (long long duration) const

  Equivalent to `MINUTES.convert(duration, this)`.

- long long **toHours** (long long duration) const

  Equivalent to `HOURS.convert(duration, this)`.

- long long **toDays** (long long duration) const

  Equivalent to `DAYS.convert(duration, this)`.

- void **timedWait** (**Synchronizable** *obj, long long timeout) const throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::NullPointerException)

  Perform a timed `Object.wait` using this time unit.

- void **timedJoin** (decaf::lang::Thread *thread, long long timeout) throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::NullPointerException)

  Perform a timed `Thread.join` using this time unit.

- void **sleep** (long long timeout) const throw (decaf::lang::exceptions::InterruptedException)

  Perform a `Thread.sleep` using this unit.

- virtual std::string **toString** () const

  *Converts the **TimeUnit** (p. 3205) type to the Name of the **TimeUnit** (p. 3205).*

- virtual int **compareTo** (const **TimeUnit** &value) const

  Compares this object with the specified object for order.

- virtual bool **equals** (const **TimeUnit** &value) const
- virtual bool **operator==** (const **TimeUnit** &value) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const **TimeUnit** &value) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

Static Public Member Functions

- static const **TimeUnit** & **valueOf** (const std::string &name) throw (decaf::lang::exceptions::IllegalArgumentException)

  Hidden Constructor, this class can not be instantiated directly.

6.687.1 Detailed Description

A **TimeUnit** (p. 3205) represents time durations at a given unit of granularity and provides utility methods to convert across units, and to perform timing and delay operations in these units. A **TimeUnit** (p. 3205) does not maintain time information, but only helps organize and use time representations that may be maintained separately across various contexts. A nanosecond is

defined as one thousandth of a microsecond, a microsecond as one thousandth of a millisecond, a millisecond as one thousandth of a second, a minute as sixty seconds, an hour as sixty minutes, and a day as twenty four hours.

A **TimeUnit** (p. 3205) is mainly used to inform time-based methods how a given timing parameter should be interpreted. For example, the following code will timeout in 50 milliseconds if the lock is not available:

Lock (p. 2023) lock = ...; if (lock.tryLock(50, **TimeUnit.MILLISECONDS** (p. 3213))) ...

while this code will timeout in 50 seconds:

Lock (p. 2023) lock = ...; if (lock.tryLock(50, **TimeUnit.SECONDS** (p. 3214))) ...

Note however, that there is no guarantee that a particular timeout implementation will be able to notice the passage of time at the same granularity as the given **TimeUnit** (p. 3205).

6.687.2 Constructor & Destructor Documentation

6.687.2.1 decaf::util::concurrent::TimeUnit::TimeUnit (int *index*, const std::string & *name*) [protected]

Hidden Constructor, this class can not be instantiated directly.

Parameters:

index - Index into the Time Unit set.

name - Name of the unit type being represented.

6.687.2.2 virtual decaf::util::concurrent::TimeUnit::~TimeUnit () [inline, virtual]

6.687.3 Member Function Documentation

6.687.3.1 virtual int decaf::util::concurrent::TimeUnit::compareTo (const TimeUnit & *value*) const [virtual]

Compares this object with the specified object for order. Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

In the foregoing description, the notation sgn(expression) designates the mathematical signum function, which is defined to return one of -1, 0, or 1 according to whether the value of expression is negative, zero or positive. The implementor must ensure sgn(x.compareTo(y)) == -sgn(y.compareTo(x)) for all x and y. (This implies that x.compareTo(y) must throw an exception iff y.compareTo(x) throws an exception.)

The implementor must also ensure that the relation is transitive: (x.compareTo(y)>0 && y.compareTo(z)>0) implies x.compareTo(z)>0.

Finally, the implementer must ensure that x.compareTo(y)==0 implies that sgn(x.compareTo(z)) == sgn(y.compareTo(z)), for all z.

It is strongly recommended, but not strictly required that (x.compareTo(y)==0) == (x.equals(y)). Generally speaking, any class that implements the Comparable interface and violates this condition should clearly indicate this fact. The recommended language is "Note: this class has a natural ordering that is inconsistent with equals."

Parameters:

value - the Object to be compared.

Returns:

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

6.687.3.2 long long decaf::util::concurrent::TimeUnit::convert (long long *sourceDuration*, const TimeUnit & *sourceUnit*) const

Convert the given time duration in the given unit to this unit. Conversions from finer to coarser granularities truncate, so lose precision. For example converting 999 milliseconds to seconds results in 0. Conversions from coarser to finer granularities with arguments that would numerically overflow saturate to Long.MIN_VALUE if negative or Long.MAX_VALUE if positive.

For example, to convert 10 minutes to milliseconds, use: TimeUnit.MILLISECONDS.convert(10L, **TimeUnit.MINUTES** (p. 3213))

Parameters:

sourceDuration - Duration value to convert.

sourceUnit - Unit type of the source duration.

Returns:

the converted duration in this unit, or Long.MIN_VALUE if conversion would negatively overflow, or Long.MAX_VALUE if it would positively overflow.

6.687.3.3 virtual bool decaf::util::concurrent::TimeUnit::equals (const TimeUnit & *value*) const [virtual]

Returns:

true if this value is considered equal to the passed value.

6.687.3.4 virtual bool decaf::util::concurrent::TimeUnit::operator< (const TimeUnit & *value*) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.687.3.5 virtual bool decaf::util::concurrent::TimeUnit::operator== (const TimeUnit & *value*) const [virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.687.3.6 void decaf::util::concurrent::TimeUnit::sleep (long long *timeout*) const throw (decaf::lang::exceptions::InterruptedException)

Perform a `Thread.sleep` using this unit. This is a convenience method that converts time arguments into the form required by the `Thread.sleep` method.

Parameters:

timeout the minimum time to sleep

See also:

Thread::sleep

6.687.3.7 void decaf::util::concurrent::TimeUnit::timedJoin (decaf::lang::Thread * *thread*, long long *timeout*) throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::NullPointerException)

Perform a timed `Thread.join` using this time unit. This is a convenience method that converts time arguments into the form required by the `Thread.join` method.

Parameters:

thread the thread to wait for

timeout the maximum time to wait

Exceptions:

InterruptedException if interrupted while waiting.

NullPointerException if the thread object is null.

See also:

Thread::join(long long, long long)

6.687.3.8 void decaf::util::concurrent::TimeUnit::timedWait (Synchronizable * *obj*, long long *timeout*) const throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::NullPointerException)

Perform a timed `Object.wait` using this time unit. This is a convenience method that converts timeout arguments into the form required by the `Object.wait` method.

For example, you could implement a blocking `poll` method (see **BlockingQueue.poll** (p. ??)) using:

```
    Object poll( long long timeout, const TimeUnit& unit )
      throw( InterruptedException ) {

      while( empty ) {
        unit.timedWait(this, timeout);
        ...
      }
  }
```

Parameters:

obj the object to wait on

timeout the maximum time to wait.

Exceptions:

InterruptedException if interrupted while waiting.

NullPointerException if the **Synchronizable** (p. 3122) object is null.

See also:

Synchronizable::wait(long long, long long)

6.687.3.9 long long decaf::util::concurrent::TimeUnit::toDays (long long *duration*) const [inline]

Equivalent to `DAYS.convert(duration, this)`.

Parameters:

duration the duration

Returns:

the converted duration.

See also:

convert (p. 3208)

6.687.3.10 long long decaf::util::concurrent::TimeUnit::toHours (long long *duration*) const [inline]

Equivalent to `HOURS.convert(duration, this)`.

Parameters:

duration the duration

Returns:

the converted duration.

See also:

convert (p. 3208)

6.687.3.11 long long decaf::util::concurrent::TimeUnit::toMicros (long long *duration*) const [inline]

Equivalent to `MICROSECONDS.convert(duration, this)`.

Parameters:

duration the duration

Returns:

the converted duration, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

See also:

convert (p. 3208)

6.687.3.12 long long decaf::util::concurrent::TimeUnit::toMillis (long long *duration*) const [inline]

Equivalent to `MILLISECONDS.convert(duration, this)`.

Parameters:

duration the duration

Returns:

the converted duration, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

See also:

convert (p. 3208)

6.687.3.13 long long decaf::util::concurrent::TimeUnit::toMinutes (long long *duration*) const [inline]

Equivalent to `MINUTES.convert(duration, this)`.

Parameters:

duration the duration

Returns:

the converted duration.

See also:

convert (p. 3208)

6.687.3.14 long long decaf::util::concurrent::TimeUnit::toNanos (long long *duration*) const [inline]

Equivalent to `NANOSECONDS.convert(duration, this)`.

Parameters:

duration the duration

Returns:

the converted duration, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

See also:

convert (p. 3208)

6.687.3.15 long long decaf::util::concurrent::TimeUnit::toSeconds (long long *duration*) const [inline]

Equivalent to `SECONDS.convert(duration, this)`.

Parameters:

duration the duration

Returns:

the converted duration.

See also:

convert (p. 3208)

6.687.3.16 virtual std::string decaf::util::concurrent::TimeUnit::toString () const [virtual]

Converts the **TimeUnit** (p. 3205) type to the Name of the **TimeUnit** (p. 3205).

Returns:

String name of the **TimeUnit** (p. 3205)

6.687.3.17 static const TimeUnit& decaf::util::concurrent::TimeUnit::valueOf (const std::string & *name*) throw (decaf::lang::exceptions::IllegalArgumentException) [static]

Returns the **TimeUnit** (p. 3205) constant of this type with the specified name. The string must match exactly an identifier used to declare an **TimeUnit** (p. 3205) constant in this type. (Extraneous whitespace characters are not permitted.)

Parameters:

name The Name of the **TimeUnit** (p. 3205) constant to be returned.

Returns:

A constant reference to the **TimeUnit** (p. 3205) Constant with the given name.

Exceptions:

IllegalArgumentException if this enum type has no constant with the specified name

6.687.4 Field Documentation

6.687.4.1 const TimeUnit decaf::util::concurrent::TimeUnit::DAYS [static]

6.687.4.2 const TimeUnit decaf::util::concurrent::TimeUnit::HOURS [static]

6.687.4.3 const TimeUnit decaf::util::concurrent::TimeUnit::MICROSECONDS [static]

6.688 cms::Topic Class Reference

An interface encapsulating a provider-specific topic name.

`#include <src/main/cms/Topic.h>`Inheritance diagram for cms::Topic:

Public Member Functions

- virtual ~**Topic** ()
- virtual std::string **getTopicName** () const =0 throw (CMSException)

  Gets the name of this topic.

6.688.1 Detailed Description

An interface encapsulating a provider-specific topic name. A **Topic** (p. 3215) is a Publish / Subscribe type **Destination** (p. 1480). All Messages sent to a **Topic** (p. 3215) are broadcast to all Subscribers of that **Topic** (p. 3215) unless the Subscriber defines a **Message** (p. 2163) selector that filters out that **Message** (p. 2163).

Since:

1.0

6.688.2 Constructor & Destructor Documentation

6.688.2.1 virtual cms::Topic::~Topic () `[inline, virtual]`

6.688.3 Member Function Documentation

6.688.3.1 virtual std::string cms::Topic::getTopicName () const throw (CMSException) `[pure virtual]`

Gets the name of this topic.

Returns:

The topic name.

Exceptions:

CMSException *(*p. ***1031***) - If an internal error occurs.

Implemented in **activemq::commands::ActiveMQTopic** (p. 601).

The documentation for this class was generated from the following file:

- src/main/cms/**Topic.h**

6.690.1 Member Typedef Documentation

6.690.1.1 typedef decaf::lang::PointerComparator<TransactionId> activemq::commands::TransactionId::COMPARATOR

Reimplemented in **activemq::commands::LocalTransactionId** (p. 1994), and **activemq::commands::XATransactionId** (p. 3411).

6.690.2 Constructor & Destructor Documentation

6.690.2.1 activemq::commands::TransactionId::TransactionId ()

6.690.2.2 activemq::commands::TransactionId::TransactionId (const TransactionId & *other*)

6.690.2.3 virtual activemq::commands::TransactionId::~TransactionId () [virtual]

6.690.3 Member Function Documentation

6.690.3.1 virtual TransactionId* activemq::commands::TransactionId::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

Reimplemented in **activemq::commands::LocalTransactionId** (p. 1994), and **activemq::commands::XATransactionId** (p. 3411).

6.690.3.2 virtual int activemq::commands::TransactionId::compareTo (const TransactionId & *value*) const [virtual]

6.690.3.3 virtual void activemq::commands::TransactionId::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Implements **activemq::commands::DataStructure** (p. 1462).

Reimplemented in **activemq::commands::LocalTransactionId** (p. 1994), and **activemq::commands::XATransactionId** (p. 3411).

6.690.3.4 virtual bool activemq::commands::TransactionId::equals (const TransactionId & *value*) const [virtual]

6.690.3.5 virtual bool activemq::commands::TransactionId::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1463).

Reimplemented in **activemq::commands::LocalTransactionId** (p. 1995), and **activemq::commands::XATransactionId** (p. 3412).

6.690.3.6 virtual unsigned char activemq::commands::TransactionId::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

Reimplemented in **activemq::commands::LocalTransactionId** (p. 1995), and **activemq::commands::XATransactionId** (p. 3412).

6.690.3.7 virtual bool activemq::commands::TransactionId::operator< (const TransactionId & *value*) const [virtual]

6.690.3.8 TransactionId& activemq::commands::TransactionId::operator= (const TransactionId & *other*)

6.690.3.9 virtual bool activemq::commands::TransactionId::operator== (const TransactionId & *value*) const [virtual]

6.690.3.10 virtual std::string activemq::commands::TransactionId::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 718).

Reimplemented in **activemq::commands::LocalTransactionId** (p. 1996), and **activemq::commands::XATransactionId** (p. 3413).

6.690.4 Field Documentation

6.690.4.1 const unsigned char activemq::commands::TransactionId::ID_TRANSACTIONID = 0 [static]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**TransactionId.h**

6.691 activemq::wireformat::openwire::marshal::v2::TransactionIdMarsh Class Reference

Marshaling code for Open Wire Format for **TransactionIdMarshaller** (p. 3220).

`#include <src/main/activemq/wireformat/openwire/marshal/v2/TransactionIdMarshaller.h>`Inheritance diagram for activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller:

Public Member Functions

- **TransactionIdMarshaller** ()

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.691.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionIdMarshaller** (p. 3220). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.691.2 Constructor & Destructor Documentation

6.691.2.1 activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller::TransactionIdMars () [inline]

6.691.2.2 virtual activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller::~TransactionIdMa () [inline, virtual]

6.691.3 Member Function Documentation

6.691.3.1 virtual void activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller** (p. 1998), and **activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller** (p. 3416).

6.691.3.2 virtual void activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller** (p. 1999), and **activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller** (p. 3417).

6.691.3.3 virtual int activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller** (p. 1999), and **activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller** (p. 3417).

6.691.3.4 virtual void activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller** (p. 1999), and **activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller** (p. 3417).

6.691.3.5 virtual void activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller** (p. 2000), and **activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller** (p. 3418).

The documentation for this class was generated from the following file:

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller** (p. 2011), and **activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller** (p. 3429).

6.692.3.3 virtual int activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller** (p. 2011), and **activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller** (p. 3429).

6.692.3.4 virtual void activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller** (p. 2011), and **activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller** (p. 3429).

6.692.3.5 virtual void activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller** (p. 2012), and **activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller** (p. 3430).

The documentation for this class was generated from the following file:

  Write a object instance to data output stream.

6.693.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionIdMarshaller** (p. 3228). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.693.2 Constructor & Destructor Documentation

6.693.2.1 activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller::TransactionIdMars () [inline]

6.693.2.2 virtual activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller::~TransactionIdMa () [inline, virtual]

6.693.3 Member Function Documentation

6.693.3.1 virtual void activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LocalTransactionIdMarshaller** (p. 2006), and **activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller** (p. 3424).

6.693.3.2 virtual void activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LocalTransactionIdMarshaller** (p. 2007), and **activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller** (p. 3425).

6.693.3.3 virtual int activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LocalTransactionIdMarshaller** (p. 2007), and **activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller** (p. 3425).

6.693.3.4 virtual void activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LocalTransactionIdMarshaller** (p. 2007), and **activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller** (p. 3425).

6.693.3.5 virtual void activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LocalTransactionIdMarshaller** (p. 2008), and **activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller** (p. 3426).

6.696.1 Constructor & Destructor Documentation

6.696.1.1 activemq::commands::TransactionInfo::TransactionInfo (const TransactionInfo &) [inline, protected]

6.696.1.2 activemq::commands::TransactionInfo::TransactionInfo ()

6.696.1.3 virtual activemq::commands::TransactionInfo::~TransactionInfo () [virtual]

6.696.2 Member Function Documentation

6.696.2.1 virtual TransactionInfo* activemq::commands::TransactionInfo::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.696.2.2 virtual void activemq::commands::TransactionInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.696.2.3 virtual bool activemq::commands::TransactionInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.696.2.4 virtual Pointer<ConnectionId>& activemq::commands::TransactionInfo::getConnectionId () [virtual]

6.696.2.5 virtual const Pointer<ConnectionId>& activemq::commands::TransactionInfo::getConnectionId () const [virtual]

6.696.2.6 virtual unsigned char activemq::commands::TransactionInfo::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.696.2.7 virtual Pointer<TransactionId>& activemq::commands::TransactionInfo::getTransactionId () [virtual]

6.696.2.8 virtual const Pointer<TransactionId>& activemq::commands::TransactionInfo::getTransactionId () const [virtual]

6.696.2.9 virtual unsigned char activemq::commands::TransactionInfo::getType () const [virtual]

6.696.2.10 virtual bool activemq::commands::TransactionInfo::isTransactionInfo () const [inline, virtual]

Returns:

an answer of true to the **isTransactionInfo()** (p. 3242) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 655).

6.696.2.11 TransactionInfo& activemq::commands::TransactionInfo::operator= (const TransactionInfo &) [inline, protected]

6.696.2.12 virtual void activemq::commands::TransactionInfo::setConnectionId (const Pointer< ConnectionId > & *connectionId*) [virtual]

6.696.2.13 virtual void activemq::commands::TransactionInfo::setTransactionId (const Pointer< TransactionId > & *transactionId*) [virtual]

6.696.2.14 virtual void activemq::commands::TransactionInfo::setType (unsigned char *type*) [virtual]

6.696.2.15 virtual std::string activemq::commands::TransactionInfo::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 655).

6.696.2.16 virtual Pointer<Command> activemq::commands::TransactionInfo::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1067).

6.696.3 Field Documentation

Marshaling code for Open Wire Format for **TransactionInfoMarshaller** (p. 3245). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.697.2 Constructor & Destructor Documentation

6.697.2.1 activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::TransactionInfoM () [inline]

6.697.2.2 virtual activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::~TransactionInfo () [inline, virtual]

6.697.3 Member Function Documentation

6.697.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.697.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::getDataStructureT () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.697.3.3 virtual void activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 679).

6.697.3.4 virtual void activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 680).

6.697.3.5 virtual int activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 681).

6.697.3.6 virtual void activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 682).

6.697.3.7 virtual void activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 683).

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 658).

6.698.3.4 virtual void activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 659).

6.698.3.5 virtual int activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 660).

6.698.3.6 virtual void activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 661).

6.698.3.7 virtual void activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 662).

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 686).

6.701.3.4 virtual void activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 687).

6.701.3.5 virtual int activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 688).

6.701.3.6 virtual void activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 689).

6.701.3.7 virtual void activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 690).

  Performs a take.

6.704.1 Detailed Description

template<typename E> class decaf::internal::util::concurrent::TransferQueue< E >

This extends Scherer-Scott dual queue algorithm, differing, among other ways, by using modes within nodes rather than marked pointers. The algorithm is a little simpler than that for stacks because fulfillers do not need explicit nodes, and matching is done by CAS'ing QNode.item field from non-null to null (for put) or vice versa (for take).

6.704.2 Constructor & Destructor Documentation

6.704.2.1 template<typename E > decaf::internal::util::concurrent::TransferQueue< E >::TransferQueue () [inline]

Node class for **TransferQueue** (p. 3268). Tries to cancel by CAS'ing ref to NULL if that succeeds then we mark as cancelled. Returns true if this node is known to be off the queue because its next pointer has been forgotten due to an advanceHead operation.

6.704.2.2 template<typename E > virtual decaf::internal::util::concurrent::TransferQueue< E >::~TransferQueue () [inline, virtual]

6.704.3 Member Function Documentation

6.704.3.1 template<typename E > virtual E* decaf::internal::util::concurrent::TransferQueue< E >::transfer (bool *timed*, long long *nanos*) throw (decaf::util::concurrent::TimeoutException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Performs a take.

Parameters:

timed if this operation should timeout

nanos the timeout, in nanoseconds

Returns:

the item provided or received;

Exceptions:

TimeoutException if the operation timed out waiting for the producer to offer an item.

InterruptedException if the thread was interrupted while waiting for the producer to offer an item.

Implements **decaf::internal::util::concurrent::Transferer< E >** (p. 3267).

6.704.3.2 template<typename E > virtual void decaf::internal::util::concurrent::TransferQueue< E >::transfer (E * *e*, bool *timed*, long long *nanos*) throw (decaf::util::concurrent::TimeoutException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Performs a put.

Parameters:

e the item to be handed to a consumer;

timed if this operation should timeout

nanos the timeout, in nanoseconds

Exceptions:

TimeoutException if the operation timed out waiting for the consumer to accept the item offered.

InterruptedException if the thread was interrupted while waiting for the consumer to accept the item offered.

Implements **decaf::internal::util::concurrent::Transferer< E >** (p. 3267).

The documentation for this class was generated from the following file:

- virtual std::string **getRemoteAddress** () const =0
- virtual void **reconnect** (const **decaf::net::URI** &uri)=0 throw (decaf::io::IOException)

  reconnect to another location

6.706.1 Detailed Description

Interface for a transport layer for command objects. Callers can send oneway messages or make synchronous requests. Non-response messages will be delivered to the specified listener object upon receipt. A user of the **Transport** (p. 3273) can set an exception listener to be notified of errors that occurs in Threads that the **Transport** (p. 3273) layer runs. Transports should be given an instance of a WireFormat object when created so that they can turn the built in Commands to / from the required wire format encoding.

6.706.2 Constructor & Destructor Documentation

6.706.2.1 virtual activemq::transport::Transport::~Transport () [inline, virtual]

6.706.3 Member Function Documentation

6.706.3.1 virtual std::string activemq::transport::Transport::getRemoteAddress () const [pure virtual]

Returns:

the remote address for this connection

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1616), **activemq::transport::IOTransport** (p. 1825), **activemq::transport::mock::MockTransport** (p. 2374), and **activemq::transport::TransportFilter** (p. 3284).

6.706.3.2 virtual TransportListener* activemq::transport::Transport::getTransportListener () const [pure virtual]

Gets the observer of asynchronous events from this transport.

Returns:

the listener of transport events.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1616), **activemq::transport::IOTransport** (p. 1825), **activemq::transport::mock::MockTransport** (p. 2375), and **activemq::transport::TransportFilter** (p. 3284).

6.706.3.3 virtual bool activemq::transport::Transport::isClosed () const [pure virtual]

Has the **Transport** (p. 3273) been shutdown and no longer usable.

Returns:

true if the **Transport** (p. 3273)

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1617), **activemq::transport::IOTransport** (p. 1825), **activemq::transport::mock::MockTransport** (p. 2375), **activemq::transport::tcp::TcpTransport** (p. 3161), and **activemq::transport::TransportFilter** (p. 3284).

6.706.3.4 virtual bool activemq::transport::Transport::isConnected () const [pure virtual]

Is the **Transport** (p. 3273) Connected to its Broker.

Returns:

true if a connection has been made.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1617), **activemq::transport::IOTransport** (p. 1826), **activemq::transport::mock::MockTransport** (p. 2375), **activemq::transport::tcp::TcpTransport** (p. 3161), and **activemq::transport::TransportFilter** (p. 3284).

6.706.3.5 virtual bool activemq::transport::Transport::isFaultTolerant () const [pure virtual]

Is this **Transport** (p. 3273) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns:

true if the **Transport** (p. 3273) is fault tolerant.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1617), **activemq::transport::IOTransport** (p. 1826), **activemq::transport::mock::MockTransport** (p. 2376), **activemq::transport::tcp::TcpTransport** (p. 3162), and **activemq::transport::TransportFilter** (p. 3284).

6.706.3.6 virtual Transport* activemq::transport::Transport::narrow (const std::type_info & *typeId*) [pure virtual]

Narrows down a Chain of Transports to a specific **Transport** (p. 3273) to allow a higher level transport to skip intermediate Transports in certain circumstances.

Parameters:

typeId - The type_info of the Object we are searching for.

Returns:

the requested Object. or NULL if its not in this chain.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1618), **activemq::transport::IOTransport** (p. 1826), **activemq::transport::mock::MockTransport** (p. 2376), and **activemq::transport::TransportFilter** (p. 3285).

Referenced by activemq::transport::failover::FailoverTransport::narrow().

6.706.3.7 virtual void activemq::transport::Transport::oneway (const Pointer< Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [pure virtual]

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command the command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Implemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2788), **activemq::transport::failover::FailoverTransport** (p. 1619), **activemq::transport::inactivity::InactivityMonitor** (p. 1735), **activemq::transport::IOTransport** (p. 1826), **activemq::transport::logging::LoggingTransport** (p. 2043), **activemq::transport::mock::MockTransport** (p. 2376), **activemq::transport::TransportFilter** (p. 3285), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2463).

6.706.3.8 virtual void activemq::transport::Transport::reconnect (const decaf::net::URI & *uri*) throw (decaf::io::IOException) [pure virtual]

reconnect to another location

Parameters:

uri

Exceptions:

IOException on failure of if not supported

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1619), and **activemq::transport::TransportFilter** (p. 3286).

6.706.3.9 virtual Pointer<Response> activemq::transport::Transport::request (const Pointer< Command > & *command*, unsigned int *timeout*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [pure virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command - The command to be sent.

timeout - The time to wait for this response.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Implemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2789), **activemq::transport::failover::FailoverTransport** (p. 1620), **activemq::transport::IOTransport** (p. 1827), **activemq::transport::logging::LoggingTransport** (p. 2043), **activemq::transport::mock::MockTransport** (p. 2377), **activemq::transport::TransportFilter** (p. 3286), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2464).

6.706.3.10 virtual Pointer<Response> activemq::transport::Transport::request (const Pointer< Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [pure virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command the command to be sent.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Implemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2789), **activemq::transport::failover::FailoverTransport** (p. 1620), **activemq::transport::IOTransport** (p. 1827), **activemq::transport::logging::LoggingTransport** (p. 2044), **activemq::transport::mock::MockTransport** (p. 2377), **activemq::transport::TransportFilter** (p. 3287), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2464).

6.706.3.11 virtual void activemq::transport::Transport::setTransportListener (TransportListener * *listener*) [pure virtual]

Sets the observer of asynchronous events from this transport.

Parameters:

listener the listener of transport events.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1622), **activemq::transport::IOTransport** (p. 1828), **activemq::transport::mock::MockTransport** (p. 2380), and **activemq::transport::TransportFilter** (p. 3287).

6.706.3.12 virtual void activemq::transport::Transport::setWireFormat (const Pointer< wireformat::WireFormat > & *wireFormat*) [pure virtual]

Sets the WireFormat instance to use.

Parameters:

wireFormat The WireFormat the object used to encode / decode commands.

Implemented in **activemq::transport::IOTransport** (p. 1828), and **activemq::transport::TransportFilter** (p. 3287).

6.706.3.13 virtual void activemq::transport::Transport::start () throw (decaf::io::IOException) [pure virtual]

Starts the **Transport** (p. 3273), the send methods of a **Transport** (p. 3273) will throw an exception if used before the **Transport** (p. 3273) is started.

Exceptions:

IOException if and error occurs while starting the **Transport** (p. 3273).

Implemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2790), **activemq::transport::failover::FailoverTransport** (p. 1623), **activemq::transport::IOTransport** (p. 1828), **activemq::transport::mock::MockTransport** (p. 2380), **activemq::transport::TransportFilter** (p. 3287), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2465).

6.706.3.14 virtual void activemq::transport::Transport::stop () throw (decaf::io::IOException) [pure virtual]

Stops the **Transport** (p. 3273).

Exceptions:

IOException if an error occurs while stopping the transport.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1623), **activemq::transport::IOTransport** (p. 1829), **activemq::transport::mock::MockTransport** (p. 2380), and **activemq::transport::TransportFilter** (p. 3288).

6.707 activemq::transport::TransportFactory Class Reference

Defines the interface for Factories that create Transports or TransportFilters.

`#include <src/main/activemq/transport/TransportFactory.h>`Inheritance diagram for activemq::transport::TransportFactory:

Public Member Functions

- virtual ~**TransportFactory** ()
- virtual **Pointer< Transport > create** (const **decaf::net::URI** &location)=0 throw (exceptions::ActiveMQException)

  *Creates a fully configured **Transport** (p. 3273) instance which could be a chain of filters and transports.*

- virtual **Pointer< Transport > createComposite** (const **decaf::net::URI** &location)=0 throw (exceptions::ActiveMQException)

  *Creates a slimed down **Transport** (p. 3273) instance which can be used in composite transport instances.*

6.707.1 Detailed Description

Defines the interface for Factories that create Transports or TransportFilters. The factory should be able to create either a completely configured **Transport** (p. 3273) meaning that it has all the appropriate filters wrapping it, or it should be able to create a slimed down version that is used in composite transports like Failover or Fanout.

Since:

3.0

6.707.2 Constructor & Destructor Documentation

6.707.2.1 virtual activemq::transport::TransportFactory::~TransportFactory () [inline, virtual]

6.707.3 Member Function Documentation

6.707.3.1 virtual Pointer<Transport> activemq::transport::TransportFactory::create (const decaf::net::URI & *location*) throw (exceptions::ActiveMQException) [pure virtual]

Creates a fully configured **Transport** (p. 3273) instance which could be a chain of filters and transports.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQexception if an error occurs

Implemented in **activemq::transport::failover::FailoverTransportFactory** (p. 1625), **activemq::transport::mock::MockTransportFactory** (p. 2383), and **activemq::transport::tcp::TcpTransportFactory** (p. 3164).

6.707.3.2 virtual Pointer<Transport> activemq::transport::TransportFactory::createComposite (const decaf::net::URI & *location*) throw (exceptions::ActiveMQException) [pure virtual]

Creates a slimed down **Transport** (p. 3273) instance which can be used in composite transport instances.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQexception if an error occurs

Implemented in **activemq::transport::failover::FailoverTransportFactory** (p. 1625), **activemq::transport::mock::MockTransportFactory** (p. 2383), and **activemq::transport::tcp::TcpTransportFactory** (p. 3164).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**TransportFactory.h**

6.708 activemq::transport::TransportFilter Class Reference

A filter on the transport layer.

`#include <src/main/activemq/transport/TransportFilter.h>`Inheritance diagram for activemq::transport::TransportFilter:

Public Member Functions

- **TransportFilter** (const **Pointer**< **Transport** > &**next**)
  Constructor.
- virtual ~**TransportFilter** ()
- virtual void **onCommand** (const **Pointer**< **Command** > &command)
  Event handler for the receipt of a command.
- virtual void **onException** (const **decaf::lang::Exception** &ex)
  Event handler for an exception from a command transport.
- virtual void **transportInterrupted** ()
  The transport has suffered an interruption from which it hopes to recover.
- virtual void **transportResumed** ()
  The transport has resumed after an interruption.
- virtual void **oneway** (const **Pointer**< **Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
  Sends a one-way command.
- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
  Not supported by this class - throws an exception.
- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
  Not supported by this class - throws an exception.
- virtual void **setTransportListener** (**TransportListener** *****listener**)
  Sets the observer of asynchronous exceptions from this transport.
- virtual **TransportListener** * **getTransportListener** () const
  Gets the observer of asynchronous exceptions from this transport.
- virtual void **setWireFormat** (const **Pointer**< **wireformat::WireFormat** > &wireFormat)
  Sets the WireFormat instance to use.
- virtual void **start** () throw (decaf::io::IOException)

Starts this transport object and creates the thread for polling on the input stream for commands.

- virtual void **stop** () throw (decaf::io::IOException)

  *Stops the **Transport** (p. 3273).*

- virtual void **close** () throw (decaf::io::IOException)

  Stops the polling thread and closes the streams.

- virtual **Transport** * **narrow** (const std::type_info &typeId)

  *Narrows down a Chain of Transports to a specific **Transport** (p. 3273) to allow a higher level transport to skip intermediate Transports in certain circumstances.*

- virtual bool **isFaultTolerant** () const

  *Is this **Transport** (p. 3273) fault tolerant, meaning that it will reconnect to a broker on disconnect.*

- virtual bool **isConnected** () const

  *Is the **Transport** (p. 3273) Connected to its Broker.*

- virtual bool **isClosed** () const

  *Has the **Transport** (p. 3273) been shutdown and no longer usable.*

- virtual std::string **getRemoteAddress** () const
- virtual void **reconnect** (const **decaf::net::URI** &uri) throw (decaf::io::IOException)

  reconnect to another location

Protected Member Functions

- void **fire** (const **decaf::lang::Exception** &ex)

  Notify the listener of the thrown Exception.

- void **fire** (const **Pointer< Command >** &command)

  Notify the listener of the new incoming Command.

Protected Attributes

- **Pointer< Transport > next**

  The transport that this filter wraps around.

- **TransportListener** * **listener**

  Listener of this transport.

6.708.1 Detailed Description

A filter on the transport layer. **Transport** (p. 3273) filters implement the **Transport** (p. 3273) interface and optionally delegate calls to another **Transport** (p. 3273) object.

Since:

1.0

6.708.2 Constructor & Destructor Documentation

6.708.2.1 activemq::transport::TransportFilter::TransportFilter (const Pointer< Transport > & *next*)

Constructor.

Parameters:

next - the next **Transport** (p. 3273) in the chain

6.708.2.2 virtual activemq::transport::TransportFilter::~TransportFilter () [inline, virtual]

6.708.3 Member Function Documentation

6.708.3.1 virtual void activemq::transport::TransportFilter::close () throw (decaf::io::IOException) [virtual]

Stops the polling thread and closes the streams. This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

Exceptions:

IOException if an error occurs while closing the **Transport** (p. 3273).

Implements **decaf::io::Closeable** (p. 1019).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2788), **activemq::transport::inactivity::InactivityMonitor** (p. 1734), **activemq::transport::tcp::TcpTransport** (p. 3161), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2463).

6.708.3.2 void activemq::transport::TransportFilter::fire (const Pointer< Command > & *command*) [protected]

Notify the listener of the new incoming Command.

Parameters:

command - the command to send to the listener

6.708.3.3 void activemq::transport::TransportFilter::fire (const decaf::lang::Exception & *ex*) [protected]

Notify the listener of the thrown Exception.

Parameters:

ex - the exception to send to listeners

6.708.3.4 virtual std::string activemq::transport::TransportFilter::getRemoteAddress () const [inline, virtual]

Returns:

the remote address for this connection

Implements **activemq::transport::Transport** (p. 3274).

6.708.3.5 virtual TransportListener* activemq::transport::TransportFilter::getTransportListener () const [inline, virtual]

Gets the observer of asynchronous exceptions from this transport.

Returns:

The listener of transport events.

Implements **activemq::transport::Transport** (p. 3274).

6.708.3.6 virtual bool activemq::transport::TransportFilter::isClosed () const [inline, virtual]

Has the **Transport** (p. 3273) been shutdown and no longer usable.

Returns:

true if the **Transport** (p. 3273)

Implements **activemq::transport::Transport** (p. 3275).

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 3161).

6.708.3.7 virtual bool activemq::transport::TransportFilter::isConnected () const [inline, virtual]

Is the **Transport** (p. 3273) Connected to its Broker.

Returns:

true if a connection has been made.

Implements **activemq::transport::Transport** (p. 3275).

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 3161).

6.708.3.8 virtual bool activemq::transport::TransportFilter::isFaultTolerant () const [inline, virtual]

Is this **Transport** (p. 3273) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns:

true if the **Transport** (p. 3273) is fault tolerant.

Implements **activemq::transport::Transport** (p. 3275).

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 3162).

6.708.3.9 virtual Transport* activemq::transport::TransportFilter::narrow (const std::type_info & *typeId*) [virtual]

Narrows down a Chain of Transports to a specific **Transport** (p. 3273) to allow a higher level transport to skip intermediate Transports in certain circumstances.

Parameters:

typeId - The type_info of the Object we are searching for.

Returns:

the requested Object. or NULL if its not in this chain.

Implements **activemq::transport::Transport** (p. 3275).

6.708.3.10 virtual void activemq::transport::TransportFilter::onCommand (const Pointer< Command > & *command*) [virtual]

Event handler for the receipt of a command.

Parameters:

command - the received command object.

Implements **activemq::transport::TransportListener** (p. 3289).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2788), **activemq::transport::inactivity::InactivityMonitor** (p. 1734), **activemq::transport::logging::LoggingTransport** (p. 2043), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2463).

6.708.3.11 virtual void activemq::transport::TransportFilter::oneway (const Pointer< Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command the command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 3276).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2788), **activemq::transport::inactivity::InactivityMonitor** (p. 1735), **activemq::transport::logging::LoggingTransport** (p. 2043), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2463).

6.708.3.12 virtual void activemq::transport::TransportFilter::onException (const decaf::lang::Exception & *ex*) [virtual]

Event handler for an exception from a command transport.

Parameters:

ex The exception to handle.

Implements **activemq::transport::TransportListener** (p. 3290).

Reimplemented in **activemq::transport::inactivity::InactivityMonitor** (p. 1735).

6.708.3.13 virtual void activemq::transport::TransportFilter::reconnect (const decaf::net::URI & *uri*) throw (decaf::io::IOException) [virtual]

reconnect to another location

Parameters:

uri

Exceptions:

IOException on failure of if not supported

Implements **activemq::transport::Transport** (p. 3276).

6.708.3.14 virtual Pointer<Response> activemq::transport::TransportFilter::request (const Pointer< Command > & *command*, unsigned int *timeout*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]

Not supported by this class - throws an exception.

Parameters:

command - The command that is sent as a request

timeout - The the time to wait for a response.

Exceptions:

IOException

UnsupportedOperationException.

Implements **activemq::transport::Transport** (p. 3276).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2789), **activemq::transport::logging::LoggingTransport** (p. 2043), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2464).

6.708.3.15 virtual Pointer<Response> activemq::transport::TransportFilter::request (const Pointer< Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]

Not supported by this class - throws an exception.

Parameters:

command the command that is sent as a request

Exceptions:

IOException

UnsupportedOperationException.

Implements **activemq::transport::Transport** (p. 3277).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2789), **activemq::transport::logging::LoggingTransport** (p. 2044), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2464).

6.708.3.16 virtual void activemq::transport::TransportFilter::setTransportListener (TransportListener * *listener*) [inline, virtual]

Sets the observer of asynchronous exceptions from this transport.

Parameters:

listener the listener of transport events.

Implements **activemq::transport::Transport** (p. 3277).

6.708.3.17 virtual void activemq::transport::TransportFilter::setWireFormat (const Pointer< wireformat::WireFormat > & *wireFormat*) [inline, virtual]

Sets the WireFormat instance to use.

Parameters:

wireFormat The WireFormat the object used to encode / decode commands.

Implements **activemq::transport::Transport** (p. 3278).

6.708.3.18 virtual void activemq::transport::TransportFilter::start () throw (decaf::io::IOException) [virtual]

Starts this transport object and creates the thread for polling on the input stream for commands. If this object has been closed, throws an exception. Before calling start, the caller must set the IO streams and the reader and writer objects.

Exceptions:

IOException if an error occurs or if this transport has already been closed.

Implements **activemq::transport::Transport** (p. 3278).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2790), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2465).

6.708.3.19 virtual void activemq::transport::TransportFilter::stop () throw (decaf::io::IOException) [virtual]

Stops the **Transport** (p. 3273).

Exceptions:

IOException if an error occurs while stopping the **Transport** (p. 3273).

Implements **activemq::transport::Transport** (p. 3278).

6.708.3.20 virtual void activemq::transport::TransportFilter::transportInterrupted () [virtual]

The transport has suffered an interruption from which it hopes to recover.

Implements **activemq::transport::TransportListener** (p. 3290).

6.708.3.21 virtual void activemq::transport::TransportFilter::transportResumed () [virtual]

The transport has resumed after an interruption.

Implements **activemq::transport::TransportListener** (p. 3290).

6.708.4 Field Documentation

6.708.4.1 TransportListener* activemq::transport::TransportFilter::listener [protected]

Listener of this transport.

6.708.4.2 Pointer<Transport> activemq::transport::TransportFilter::next [protected]

The transport that this filter wraps around.

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**TransportFilter.h**

6.709 activemq::transport::TransportListener Class Reference

A listener of asynchronous exceptions from a command transport object.

`#include <src/main/activemq/transport/TransportListener.h>`Inheritance diagram for activemq::transport::TransportListener:

Public Member Functions

- virtual ~**TransportListener** ()
- virtual void **onCommand** (const **Pointer**< **Command** > &command)=0

  Event handler for the receipt of a command.

- virtual void **onException** (const **decaf::lang::Exception** &ex)=0

  Event handler for an exception from a command transport.

- virtual void **transportInterrupted** ()=0

  The transport has suffered an interruption from which it hopes to recover.

- virtual void **transportResumed** ()=0

  The transport has resumed after an interruption.

6.709.1 Detailed Description

A listener of asynchronous exceptions from a command transport object.

6.709.2 Constructor & Destructor Documentation

6.709.2.1 virtual activemq::transport::TransportListener::~TransportListener () `[inline, virtual]`

6.709.3 Member Function Documentation

6.709.3.1 virtual void activemq::transport::TransportListener::onCommand (const Pointer< Command > & *command*) `[pure virtual]`

Event handler for the receipt of a command. The transport passes off all received commands to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 3273) deletes the command upon receipt.

Parameters:

command the received command object.

Implemented in **activemq::core::ActiveMQConnection** (p. 240), **activemq::transport::correlator::ResponseCorrelator** (p. 2788), **activemq::transport::failover::FailoverTransportListener** (p. 1628), **activemq::transport::inactivity::InactivityMonitor** (p. 1734), **activemq::transport::logging::LoggingTransport** (p. 2043), **activemq::transport::mock::InternalCommandListener** (p. 1800), **activemq::transport::TransportFilter** (p. 3285), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2463).

6.709.3.2 virtual void activemq::transport::TransportListener::onException (const decaf::lang::Exception & *ex*) [pure virtual]

Event handler for an exception from a command transport.

Parameters:

ex The exception being propagated to this listener to handle.

Implemented in **activemq::core::ActiveMQConnection** (p. 240), **activemq::transport::failover::BackupTransport** (p. 645), **activemq::transport::failover::FailoverTransportListener** (p. 1628), **activemq::transport::inactivity::InactivityMonitor** (p. 1735), and **activemq::transport::TransportFilter** (p. 3286).

6.709.3.3 virtual void activemq::transport::TransportListener::transportInterrupted () [pure virtual]

The transport has suffered an interruption from which it hopes to recover.

Implemented in **activemq::core::ActiveMQConnection** (p. 242), **activemq::transport::DefaultTransportListener** (p. 1476), **activemq::transport::failover::FailoverTransportListener** (p. 1628), and **activemq::transport::TransportFilter** (p. 3288).

6.709.3.4 virtual void activemq::transport::TransportListener::transportResumed () [pure virtual]

The transport has resumed after an interruption.

Implemented in **activemq::core::ActiveMQConnection** (p. 242), **activemq::transport::DefaultTransportListener** (p. 1476), **activemq::transport::failover::FailoverTransportListener** (p. 1628), and **activemq::transport::TransportFilter** (p. 3288).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**TransportListener.h**

6.710 activemq::transport::TransportRegistry Class Reference

Registry of all **Transport** (p. 3273) Factories that are available to the client at runtime.

`#include <src/main/activemq/transport/TransportRegistry.h>`

Public Member Functions

- virtual ~**TransportRegistry** ()
- **TransportFactory** * **findFactory** (const std::string &name) const throw (decaf::lang::exceptions::NoSuchElementException)

  *Gets a Registered **TransportFactory** (p. 3279) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.*

- void **registerFactory** (const std::string &name, **TransportFactory** *factory) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)

  *Registers a new **TransportFactory** (p. 3279) with this Registry.*

- void **unregisterFactory** (const std::string &name)

  Unregisters the Factory with the given name and deletes that instance of the Factory.

- std::vector< std::string > **getTransportNames** () const

  Retrieves a list of the names of all the Registered Transport's in this Registry.

Static Public Member Functions

- static **TransportRegistry** & **getInstance** ()

  *Gets the single instance of the **TransportRegistry** (p. 3291).*

6.710.1 Detailed Description

Registry of all **Transport** (p. 3273) Factories that are available to the client at runtime. New Transport's must have a factory registered here before a connection attempt is made.

Since:

3.0

6.710.2 Constructor & Destructor Documentation

6.710.2.1 virtual activemq::transport::TransportRegistry::~TransportRegistry () [virtual]

6.710.3 Member Function Documentation

6.710.3.1 TransportFactory* activemq::transport::TransportRegistry::findFactory (const std::string & *name*) const throw (decaf::lang::exceptions::NoSuchElementException)

Gets a Registered **TransportFactory** (p. 3279) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.

Parameters:

name The name of the Factory to find in the Registry.

Returns:

the Factory registered under the given name.

Exceptions:

NoSuchElementException if no factory is registered with that name.

6.710.3.2 static TransportRegistry& activemq::transport::TransportRegistry::getInstance () [static]

Gets the single instance of the **TransportRegistry** (p. 3291).

Returns:

reference to the single instance of this Registry

6.710.3.3 std::vector<std::string> activemq::transport::TransportRegistry::getTransportNames () const

Retrieves a list of the names of all the Registered Transport's in this Registry.

Returns:

stl vector of strings with all the **Transport** (p. 3273) names registered.

6.710.3.4 void activemq::transport::TransportRegistry::registerFactory (const std::string & *name*, TransportFactory * *factory*) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)

Registers a new **TransportFactory** (p. 3279) with this Registry. If a Factory with the given name is already registered it is overwritten with the new one. Once a factory is added to the Registry its lifetime is controlled by the Registry, it will be deleted once the Registry has been deleted.

Parameters:

name The name of the new Factory to register.

factory The new Factory to add to the Registry.

Exceptions:

IllegalArgumentException is name is the empty string.

NullPointerException if the Factory is Null.

6.710.3.5 void activemq::transport::TransportRegistry::unregisterFactory (const std::string & *name*)

Unregisters the Factory with the given name and deletes that instance of the Factory.

Parameters:

name Name of the Factory to unregister and destroy

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**TransportRegistry.h**

6.711 decaf::net::UnknownHostException Class Reference

`#include <src/main/decaf/net/UnknownHostException.h>`Inheritance diagram for decaf::net::UnknownHostException:

Public Member Functions

- **UnknownHostException** () throw ()
  Default Constructor.
- **UnknownHostException** (const Exception &ex) throw ()
  Conversion Constructor from some other Exception.
- **UnknownHostException** (const **UnknownHostException** &ex) throw ()
  Copy Constructor.
- **UnknownHostException** (const char *file, const int lineNumber, const std::exception ***cause**, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- **UnknownHostException** (const std::exception ***cause**) throw ()
  Constructor.
- **UnknownHostException** (const char *file, const int lineNumber, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **UnknownHostException** * **clone** () const
  Clones this exception.
- virtual ~**UnknownHostException** () throw ()

6.711.1 Constructor & Destructor Documentation

6.711.1.1 decaf::net::UnknownHostException::UnknownHostException () throw () [inline]

Default Constructor.

6.711.1.2 decaf::net::UnknownHostException::UnknownHostException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.711.1.3 decaf::net::UnknownHostException::UnknownHostException (const UnknownHostException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.711.1.4 decaf::net::UnknownHostException::UnknownHostException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.711.1.5 decaf::net::UnknownHostException::UnknownHostException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.711.1.6 decaf::net::UnknownHostException::UnknownHostException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.711.1.7 virtual decaf::net::UnknownHostException::~UnknownHostException () throw () [inline, virtual]

6.711.2 Member Function Documentation

6.711.2.1 virtual UnknownHostException* decaf::net::UnknownHostException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1822).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**UnknownHostException.h**

6.712 decaf::net::UnknownServiceException Class Reference

`#include <src/main/decaf/net/UnknownServiceException.h>`Inheritance diagram for decaf::net::UnknownServiceException:

Public Member Functions

- **UnknownServiceException** () throw ()
  Default Constructor.
- **UnknownServiceException** (const Exception &ex) throw ()
  Conversion Constructor from some other Exception.
- **UnknownServiceException** (const **UnknownServiceException** &ex) throw ()
  Copy Constructor.
- **UnknownServiceException** (const char *file, const int lineNumber, const std::exception ***cause**, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- **UnknownServiceException** (const std::exception ***cause**) throw ()
  Constructor.
- **UnknownServiceException** (const char *file, const int lineNumber, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **UnknownServiceException** * **clone** () const
  Clones this exception.
- virtual ~**UnknownServiceException** () throw ()

6.712.1 Constructor & Destructor Documentation

6.712.1.1 decaf::net::UnknownServiceException::UnknownServiceException () throw () [inline]

Default Constructor.

6.712.1.2 decaf::net::UnknownServiceException::UnknownServiceException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.712.1.3 decaf::net::UnknownServiceException::UnknownServiceException (const UnknownServiceException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.712.1.4 decaf::net::UnknownServiceException::UnknownServiceException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.712.1.5 decaf::net::UnknownServiceException::UnknownServiceException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.712.1.6 decaf::net::UnknownServiceException::UnknownServiceException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.712.1.7 virtual decaf::net::UnknownServiceException::~UnknownServiceException () throw () [inline, virtual]

6.712.2 Member Function Documentation

6.712.2.1 virtual UnknownServiceException* decaf::net::UnknownServiceException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1822).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**UnknownServiceException.h**

6.713.1 Detailed Description

Thrown when the the Character Encoding is not supported.

Since:

1.0

6.713.2 Constructor & Destructor Documentation

6.713.2.1 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException () throw () [inline]

Default Constructor.

6.713.2.2 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const lang::Exception & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex the exception to copy

6.713.2.3 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const UnsupportedEncodingException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex the exception to copy, which is an instance of this type

6.713.2.4 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.713.2.5 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.713.2.6 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.713.2.7 virtual decaf::io::UnsupportedEncodingException::~UnsupportedEncodingException () throw () [inline, virtual]

6.713.3 Member Function Documentation

6.713.3.1 virtual UnsupportedEncodingException* decaf::io::UnsupportedEncodingException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A new instance of an Exception object that is a copy of this instance.

Reimplemented from **decaf::io::IOException** (p. 1822).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**UnsupportedEncodingException.h**

6.714 cms::UnsupportedOperationException Class Reference

This exception must be thrown when a CMS client attempts use a CMS method that is not implemented or not supported by the CMS Provider in use.

6.715.1 Constructor & Destructor Documentation

6.715.1.1 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationExceptio () throw () [inline]

Default Constructor.

6.715.1.2 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationExceptio (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1574).

Parameters:

ex An exception that should become this type of **Exception** (p. 1574)

6.715.1.3 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationExceptio (const UnsupportedOperationException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of **Exception** (p. 1574)

6.715.1.4 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationExceptio (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.715.1.5 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationExceptio (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause **Pointer** (p. 2497) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.715.1.6 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationExceptio (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.715.1.7 virtual decaf::lang::exceptions::UnsupportedOperationException::~UnsupportedOperationExcept () throw () [inline, virtual]

6.715.2 Member Function Documentation

6.715.2.1 virtual UnsupportedOperationException* decaf::lang::exceptions::UnsupportedOperationException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1574) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1577).

Reimplemented in **decaf::nio::ReadOnlyBufferException** (p. 2687).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**UnsupportedOperationException.h**

6.716 decaf::net::URI Class Reference

This class represents an instance of a **URI** (p. 3308) as defined by RFC 2396.

  *Creates a **URI** (p. 3308) by parsing the given string.*

6.716.1 Detailed Description

This class represents an instance of a **URI** (p. 3308) as defined by RFC 2396.

6.716.2 Constructor & Destructor Documentation

6.716.2.1 decaf::net::URI::URI ()

Default Constructor, same as calling a Constructor with all fields empty.

6.716.2.2 decaf::net::URI::URI (const URI & *uri*) throw (URISyntaxException)

Constructs a **URI** (p. 3308) as a copy of another **URI** (p. 3308).

Parameters:

uri - uri to copy

6.716.2.3 decaf::net::URI::URI (const std::string & *uri*) throw (URISyntaxException)

Constructs a **URI** (p. 3308) from the given string.

Parameters:

uri - string uri to parse.

6.716.2.4 decaf::net::URI::URI (const std::string & *scheme*, const std::string & *ssp*, const std::string & *fragment*) throw (URISyntaxException)

Constructs a **URI** (p. 3308) from the given components.

Parameters:

scheme - the uri scheme

ssp - Scheme specific part

fragment - Fragment

6.716.2.5 decaf::net::URI::URI (const std::string & *scheme*, const std::string & *userInfo*, const std::string & *host*, int *port*, const std::string & *path*, const std::string & *query*, const std::string & *fragment*) throw (URISyntaxException)

Constructs a **URI** (p. 3308) from the given components.

Parameters:

scheme - Scheme name

userInfo - User name and authorization information

host - Host name

port - Port number

path - Path

query - Query

fragment - Fragment

6.716.2.6 decaf::net::URI::URI (const std::string & *scheme*, const std::string & *host*, const std::string & *path*, const std::string & *fragment*) throw (URISyntaxException)

Constructs a **URI** (p. 3308) from the given components.

Parameters:

scheme - Scheme name

host - Host name

path - Path

fragment - Fragment

6.716.2.7 decaf::net::URI::URI (const std::string & *scheme*, const std::string & *authority*, const std::string & *path*, const std::string & *query*, const std::string & *fragment*) throw (URISyntaxException)

Constructs a **URI** (p. 3308) from the given components.

Parameters:

scheme - Scheme name

authority - Authority

path - Path

query - Query

fragment - Fragment

6.716.2.8 virtual decaf::net::URI::~URI () [inline, virtual]

6.716.3 Member Function Documentation

6.716.3.1 virtual int decaf::net::URI::compareTo (const URI & *value*) const [virtual]

Compares this object with the specified object for order. Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Parameters:

value - the value to compare to this one.

Returns:

zero if equal minus one if less than and one if greater than.

6.716.3.2 static URI decaf::net::URI::create (const std::string *uri*) throw (lang::exceptions::IllegalArgumentException) [static]

Creates a **URI** (p. 3308) by parsing the given string. This convenience factory method works as if by invoking the URI(string) constructor; any **URISyntaxException** (p. 3335) thrown by the constructor is caught and wrapped in a new IllegalArgumentException object, which is then thrown.

Parameters:

uri - **URI** (p. 3308) string to parse

Exceptions:

IllegalArgumentException

6.716.3.3 virtual bool decaf::net::URI::equals (const URI & *value*) const [virtual]

Returns:

true if this value is considered equal to the passed value.

6.716.3.4 std::string decaf::net::URI::getAuthority () const

Returns:

the decoded authority component of this **URI** (p. 3308).

6.716.3.5 std::string decaf::net::URI::getFragment () const

Returns:

the decoded fragment component of this **URI** (p. 3308).

6.716.3.6 std::string decaf::net::URI::getHost () const

Returns:

the host component of this **URI** (p. 3308).

6.716.3.7 std::string decaf::net::URI::getPath () const

Returns:

the path component of this **URI** (p. 3308).

6.716.3.8 int decaf::net::URI::getPort () const

Returns:

the port component of this **URI** (p. 3308).

6.716.3.9 std::string decaf::net::URI::getQuery () const

Returns:

the query component of this **URI** (p. 3308).

6.716.3.10 std::string decaf::net::URI::getRawAuthority () const

Returns the raw authority component of this **URI** (p. 3308). The authority component of a **URI** (p. 3308), if defined, only contains the commercial-at character ('@') and characters in the unreserved, punct, escaped, and other categories. If the authority is server-based then it is further constrained to have valid user-information, host, and port components.

Returns:

the raw authority component of the **URI** (p. 3308)

6.716.3.11 std::string decaf::net::URI::getRawFragment () const

Returns the raw fragment component of this **URI** (p. 3308). The fragment component of a **URI** (p. 3308), if defined, only contains legal **URI** (p. 3308) characters.

Returns:

the raw fragment component of this **URI** (p. 3308)

6.716.3.12 std::string decaf::net::URI::getRawPath () const

Returns the raw path component of this **URI** (p. 3308). The path component of a **URI** (p. 3308), if defined, only contains the slash character ('/'), the commercial-at character ('@'), and characters in the unreserved, punct, escaped, and other categories.

Returns:

the raw path component of this **URI** (p. 3308)

6.716.3.13 std::string decaf::net::URI::getRawQuery () const

Returns the raw query component of this **URI** (p. 3308). The query component of a **URI** (p. 3308), if defined, only contains legal **URI** (p. 3308) characters.

Returns:

the raw query component of the **URI** (p. 3308).

6.716.3.14 std::string decaf::net::URI::getRawSchemeSpecificPart () const

Returns the raw scheme-specific part of this **URI** (p. 3308). The scheme-specific part is never undefined, though it may be empty. The scheme-specific part of a **URI** (p. 3308) only contains legal **URI** (p. 3308) characters.

Returns:

the raw scheme special part of the uri

6.716.3.15 std::string decaf::net::URI::getRawUserInfo () const

Returns the raw user-information component of this **URI** (p. 3308). The user-information component of a **URI** (p. 3308), if defined, only contains characters in the unreserved, punct, escaped, and other categories.

Returns:

the raw user-information component of the **URI** (p. 3308)

6.716.3.16 std::string decaf::net::URI::getScheme () const

Returns:

the scheme component of this **URI** (p. 3308)

6.716.3.17 std::string decaf::net::URI::getSchemeSpecificPart () const

Returns the decoded scheme-specific part of this **URI** (p. 3308). The string returned by this method is equal to that returned by the getRawSchemeSpecificPart method except that all sequences of escaped octets are decoded.

Returns:

the raw scheme specific part of the uri.

6.716.3.18 std::string decaf::net::URI::getUserInfo () const

Returns:

the user info component of this **URI** (p. 3308)

6.716.3.19 bool decaf::net::URI::isAbsolute () const

Tells whether or not this **URI** (p. 3308) is absolute. A **URI** (p. 3308) is absolute if, and only if, it has a scheme component.

Returns:

true if, and only if, this **URI** (p. 3308) is absolute

6.716.3.20 bool decaf::net::URI::isOpaque () const

Tells whether or not this **URI** (p. 3308) is opaque. A **URI** (p. 3308) is opaque if, and only if, it is absolute and its scheme-specific part does not begin with a slash character ('/'). An opaque **URI** (p. 3308) has a scheme, a scheme-specific part, and possibly a fragment; all other components are undefined.

Returns:

true if, and only if, this **URI** (p. 3308) is opaque

6.716.3.21 URI decaf::net::URI::normalize () const

Normalizes this URI's path. If this **URI** (p. 3308) is opaque, or if its path is already in normal form, then this **URI** (p. 3308) is returned. Otherwise a new **URI** (p. 3308) is constructed that is identical to this **URI** (p. 3308) except that its path is computed by normalizing this URI's path in a manner consistent with RFC 2396, section 5.2, step 6, sub-steps c through f; that is:

1. All "." segments are removed. 2. If a ".." segment is preceded by a non-".." segment then both of these segments are removed. This step is repeated until it is no longer applicable. 3. If the path is relative, and if its first segment contains a colon character (':'), then a "." segment is prepended. This prevents a relative **URI** (p. 3308) with a path such as "a:b/c/d" from later being re-parsed as an opaque **URI** (p. 3308) with a scheme of "a" and a scheme-specific part of "b/c/d". (Deviation from RFC 2396)

A normalized path will begin with one or more ".." segments if there were insufficient non-".." segments preceding them to allow their removal. A normalized path will begin with a "." segment if one was inserted by step 3 above. Otherwise, a normalized path will not contain any "." or ".." segments.

Returns:

A **URI** (p. 3308) equivalent to this **URI** (p. 3308), but whose path is in normal form

6.716.3.22 virtual bool decaf::net::URI::operator< (const URI & *value*) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.716.3.23 virtual bool decaf::net::URI::operator== (const URI & *value*) const [virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.716.3.24 URI decaf::net::URI::parseServerAuthority () const throw (URISyntaxException)

Attempts to parse this URI's authority component, if defined, into user-information, host, and port components. If this URI's authority component has already been recognized as being server-based then it will already have been parsed into user-information, host, and port components. In this case, or if this **URI** (p. 3308) has no authority component, this method simply returns this **URI** (p. 3308).

Otherwise this method attempts once more to parse the authority component into user-information, host, and port components, and throws an exception describing why the authority component could not be parsed in that way.

Returns:

A **URI** (p. 3308) whose authority field has been parsed as a server-based authority

Exceptions:

URISyntaxException *(p. 3335)* - If the authority component of this **URI** (p. 3308) is defined but cannot be parsed as a server-based authority.

6.716.3.25 URI decaf::net::URI::relativize (const URI & *uri*) const

Relativizes the given **URI** (p. 3308) against this **URI** (p. 3308). The relativization of the given **URI** (p. 3308) against this **URI** (p. 3308) is computed as follows:

1. If either this **URI** (p. 3308) or the given **URI** (p. 3308) are opaque, or if the scheme and authority components of the two URIs are not identical, or if the path of this **URI** (p. 3308) is not a prefix of the path of the given **URI** (p. 3308), then the given **URI** (p. 3308) is returned. 2. Otherwise a new relative hierarchical **URI** (p. 3308) is constructed with query and fragment components taken from the given **URI** (p. 3308) and with a path component computed by removing this URI's path from the beginning of the given URI's path.

Parameters:

uri - The **URI** (p. 3308) to be relativized against this **URI** (p. 3308)

Returns:

The resulting **URI** (p. 3308)

6.716.3.26 URI decaf::net::URI::resolve (const URI & *uri*) const

Resolves the given **URI** (p. 3308) against this **URI** (p. 3308). If the given **URI** (p. 3308) is already absolute, or if this **URI** (p. 3308) is opaque, then a copy of the given **URI** (p. 3308) is returned.

If the given URI's fragment component is defined, its path component is empty, and its scheme, authority, and query components are undefined, then a **URI** (p. 3308) with the given fragment but with all other components equal to those of this **URI** (p. 3308) is returned. This allows a **URI** (p. 3308) representing a standalone fragment reference, such as "#foo", to be usefully resolved against a base **URI** (p. 3308).

Otherwise this method constructs a new hierarchical **URI** (p. 3308) in a manner consistent with RFC 2396, section 5.2; that is:

1. A new **URI** (p. 3308) is constructed with this URI's scheme and the given URI's query and fragment components. 2. If the given **URI** (p. 3308) has an authority component then the new URI's authority and path are taken from the given **URI** (p. 3308). 3. Otherwise the new URI's authority component is copied from this **URI** (p. 3308), and its path is computed as follows:

1. If the given URI's path is absolute then the new URI's path is taken from the given **URI** (p. 3308). 2. Otherwise the given URI's path is relative, and so the new URI's path is computed by resolving the path of the given **URI** (p. 3308) against the path of this **URI** (p. 3308). This is done by concatenating all but the last segment of this URI's path, if any, with the given URI's path and then normalizing the result as if by invoking the normalize method.

The result of this method is absolute if, and only if, either this **URI** (p. 3308) is absolute or the given **URI** (p. 3308) is absolute.

Parameters:

uri - The **URI** (p. 3308) to be resolved against this **URI** (p. 3308)

Returns:

The resulting **URI** (p. 3308)

6.716.3.27 URI decaf::net::URI::resolve (const std::string & *str*) const throw (lang::exceptions::IllegalArgumentException)

Constructs a new **URI** (p. 3308) by parsing the given string and then resolving it against this **URI** (p. 3308). This convenience method works as if invoking it were equivalent to evaluating the expression resolve(URI::create(str)).

Parameters:

str - The string to be parsed into a **URI** (p. 3308)

Returns:

The resulting **URI** (p. 3308)

Exceptions:

IllegalArgumentException - If the given string violates RFC 2396

6.716.3.28 std::string decaf::net::URI::toString () const

Returns the content of this **URI** (p. 3308) as a string. If this **URI** (p. 3308) was created by invoking one of the constructors in this class then a string equivalent to the original input string, or to the string computed from the originally-given components, as appropriate, is returned. Otherwise this **URI** (p. 3308) was created by normalization, resolution, or relativization, and so a string is constructed from this URI's components according to the rules specified in RFC 2396, section 5.2, step 7.

Returns:

the string form of this **URI** (p. 3308)

6.716.3.29 URL decaf::net::URI::toURL () const throw (MalformedURLException, lang::exceptions::IllegalArgumentException)

Constructs a **URL** (p. 3347) from this **URI** (p. 3308). This convenience method works as if invoking it were equivalent to evaluating the expression new **URL** (p. 3347)(this.toString()) after first checking that this **URI** (p. 3308) is absolute.

Returns:

A **URL** (p. 3347) constructed from this **URI** (p. 3308)

Exceptions:

IllegalArgumentException - If this **URL** (p. 3347) is not absolute

MalformedURLException *(p. 2091)* - If a protocol handler for the **URL** (p. 3347) could not be found, or if some other error occurred while constructing the **URL** (p. 3347)

The documentation for this class was generated from the following file:

  All characters except letters ('a'.

- static std::string **encodeOthers** (const std::string &s)

  Other characters, which are chars that are not US-ASCII, and are not ISO Control or are not ISO Space chars are not preserved.

- static std::string **decode** (const std::string &s)

  Decodes the string argument which is assumed to be encoded in the `x-www-form-urlencoded` MIME content type using the UTF-8 encoding scheme.

6.717.1 Constructor & Destructor Documentation

6.717.1.1 decaf::internal::net::URIEncoderDecoder::URIEncoderDecoder ()

6.717.1.2 virtual decaf::internal::net::URIEncoderDecoder::~URIEncoderDecoder () `[inline, virtual]`

6.717.2 Member Function Documentation

6.717.2.1 static std::string decaf::internal::net::URIEncoderDecoder::decode (const std::string & *s*) `[static]`

Decodes the string argument which is assumed to be encoded in the `x-www-form-urlencoded` MIME content type using the UTF-8 encoding scheme. " and two following hex digit characters are converted to the equivalent byte value. All other characters are passed through unmodified.

e.g. "A%20B%20C %24%25" -> "A B C $%"

Parameters:

s - The encoded string.

Returns:

The decoded version.

6.717.2.2 static std::string decaf::internal::net::URIEncoderDecoder::encodeOthers (const std::string & *s*) [static]

Other characters, which are chars that are not US-ASCII, and are not ISO Control or are not ISO Space chars are not preserved. They are converted into their hexidecimal value prepended by ".

For example: Euro currency symbol -> "%E2%82%AC".

Parameters:

s - the string to be converted

Returns:

the converted string

6.717.2.3 static std::string decaf::internal::net::URIEncoderDecoder::quoteIllegal (const std::string & *s*, const std::string & *legal*) [static]

All characters except letters ('a'. .'z', 'A'..'Z') and numbers ('0'..'9') and legal characters are converted into their hexidecimal value prepended by ".

For example: '#' -> 23

Other characters, which are chars that are not US-ASCII, and are not ISO Control or are not ISO Space chars, are preserved.

Parameters:

s - the string to be converted

legal - the characters allowed to be preserved in the string s

Returns:

converted string

6.717.2.4 static void decaf::internal::net::URIEncoderDecoder::validate (const std::string & *s*, const std::string & *legal*) throw (decaf::net::URISyntaxException) [static]

Validate a string by checking if it contains any characters other than:. 1. letters ('a'..'z', 'A'..'Z') 2. numbers ('0'..'9') 3. characters in the legalset parameter 4. characters that are not ISO Control or are not ISO Space characters)

Parameters:

s - the string to be validated

legal - the characters allowed in the string s

6.717.2.5 static void decaf::internal::net::URIEncoderDecoder::validateSimple (const std::string & *s*, const std::string & *legal*) throw (decaf::net::URISyntaxException) [static]

Validate a string by checking if it contains any characters other than:. 1. letters ('a'..'z', 'A'..'Z') 2. numbers ('0'..'9') 3. characters in the legalset parameter

Parameters:

s - the string to be validated

legal - the characters allowed in the string s

The documentation for this class was generated from the following file:

6.718 decaf::internal::net::URIHelper Class Reference

Helper class used by the URI classes in encoding and decoding of URI's.

`#include <src/main/decaf/internal/net/URIHelper.h>`

Public Member Functions

- **URIHelper** (const std::string &unreserved, const std::string &punct, const std::string &reserved, const std::string &someLegal, const std::string &allLegal)

  *Setup the **URIHelper** (p. 3322) with values assigned to the various fields that are used in the validation process.*

- **URIHelper** ()

  Sets up the filter strings with sane defaults.

- virtual ~**URIHelper** ()
- **URIType parseURI** (const std::string &uri, bool forceServer) throw (decaf::net::URISyntaxException)

  Parse the passed in URI.

- void **validateScheme** (const std::string &uri, const std::string &scheme, int index) throw (decaf::net::URISyntaxException)

  Validate the schema portin of the URI.

- void **validateSsp** (const std::string &uri, const std::string &ssp, std::size_t index) throw (decaf::net::URISyntaxException)

  Validate that the URI Ssp Segment contains no invalid encodings.

- void **validateAuthority** (const std::string &uri, const std::string &authority, std::size_t index) throw (decaf::net::URISyntaxException)

  Validate that the URI Authority Segment contains no invalid encodings.

- void **validatePath** (const std::string &uri, const std::string &path, std::size_t index) throw (decaf::net::URISyntaxException)

  Validate that the URI Path Segment contains no invalid encodings.

- void **validateQuery** (const std::string &uri, const std::string &query, std::size_t index) throw (decaf::net::URISyntaxException)

  Validate that the URI Query Segment contains no invalid encodings.

- void **validateFragment** (const std::string &uri, const std::string &fragment, std::size_t index) throw (decaf::net::URISyntaxException)

  Validate that the URI fragment contains no invalid encodings.

- **URIType parseAuthority** (bool forceServer, const std::string &authority) throw (decaf::net::URISyntaxException)

  determine the host, port and user-info if the authority parses successfully to a server based authority

- void **validateUserinfo** (const std::string &uri, const std::string &userinfo, std::size_t index) throw (decaf::net::URISyntaxException)

  Check the supplied user info for validity.

- bool **isValidHost** (bool forceServer, const std::string &host) throw (decaf::net::URISyntaxException)

  distinguish between IPv4, IPv6, domain name and validate it based on its type

- bool **isValidDomainName** (const std::string &host)

  Validates the string past to determine if it is a well formed domain name.

- bool **isValidIPv4Address** (const std::string &host)

  Validate if the host value is a well formed IPv4 address, this is the form XXX.XXX.XXX.XXX were X is any number 0-9.

- bool **isValidIP6Address** (const std::string &ipAddress)

  Determines if the given address is valid according to the IPv6 spec.

- bool **isValidIP4Word** (const std::string &word)

  Check is the string passed contains a Valid IPv4 word, which is an integer in the range of 0 to 255.

- bool **isValidHexChar** (char c)

  Determines if the given char is a valid Hex char.

6.718.1 Detailed Description

Helper class used by the URI classes in encoding and decoding of URI's.

6.718.2 Constructor & Destructor Documentation

6.718.2.1 decaf::internal::net::URIHelper::URIHelper (const std::string & *unreserved*, const std::string & *punct*, const std::string & *reserved*, const std::string & *someLegal*, const std::string & *allLegal*)

Setup the **URIHelper** (p. 3322) with values assigned to the various fields that are used in the validation process. The defaults are overridden by these values.

Parameters:

unreserved - characters not reserved for use.

punct - allowable punctuation symbols.

reserved - characters not allowed for general use in the URI.

someLegal - characters that are legal in certain cases.

allLegal - characters that are always legal.

6.718.2.2 decaf::internal::net::URIHelper::URIHelper ()

Sets up the filter strings with sane defaults.

6.718.2.3 virtual decaf::internal::net::URIHelper::~URIHelper () [inline, virtual]

6.718.3 Member Function Documentation

6.718.3.1 bool decaf::internal::net::URIHelper::isValidDomainName (const std::string & *host*)

Validates the string past to determine if it is a well formed domain name.

Parameters:

host - domain name to validate.

Returns:

true if host is well formed.

6.718.3.2 bool decaf::internal::net::URIHelper::isValidHexChar (char *c*)

Determines if the given char is a valid Hex char. Valid chars are A-F (upper or lower case) and 0-9.

Parameters:

c - char to inspect

Returns:

true if c is a valid hex char.

6.718.3.3 bool decaf::internal::net::URIHelper::isValidHost (bool *forceServer*, const std::string & *host*) throw (decaf::net::URISyntaxException)

distinguish between IPv4, IPv6, domain name and validate it based on its type

Parameters:

forceServer - true if the forceServer mode should be active.

host - Host string to validate.

Returns:

true if the host value if a valid domain name.

Exceptions:

URISyntaxException if the host is invalid and forceServer is true.

6.718.3.4 bool decaf::internal::net::URIHelper::isValidIP4Word (const std::string & *word*)

Check is the string passed contains a Valid IPv4 word, which is an integer in the range of 0 to 255.

Parameters:

word - string value to check.

Returns:

true if the word is a valid IPv4 word.

6.718.3.5 bool decaf::internal::net::URIHelper::isValidIP6Address (const std::string & *ipAddress*)

Determines if the given address is valid according to the IPv6 spec.

Parameters:

ipAddress - string ip address value to validate.

Returns:

true if the address string is valid.

6.718.3.6 bool decaf::internal::net::URIHelper::isValidIPv4Address (const std::string & *host*)

Validate if the host value is a well formed IPv4 address, this is the form XXX.XXX.XXX.XXX were X is any number 0-9. and XXX is not greater than 255.

Parameters:

host - IPv4 address string to parse.

Returns:

true if host is a well formed IPv4 address.

6.718.3.7 URIType decaf::internal::net::URIHelper::parseAuthority (bool *forceServer*, const std::string & *authority*) throw (decaf::net::URISyntaxException)

determine the host, port and user-info if the authority parses successfully to a server based authority behavior in error cases: if forceServer is true, throw URISyntaxException with the proper diagnostic messages. if forceServer is false assume this is a registry based uri, and just return leaving the host, port and user-info fields undefined.

and there are some error cases where URISyntaxException is thrown regardless of the forceServer parameter e.g. mal-formed ipv6 address

Parameters:

forceServer

authority

Returns:

a **URIType** (p. 3339) instance containing the parsed data.

Exceptions:

URISyntaxException

6.718.3.8 URIType decaf::internal::net::URIHelper::parseURI (const std::string & *uri*, bool *forceServer*) throw (decaf::net::URISyntaxException)

Parse the passed in URI.

Parameters:

uri - the URI to Parse

forceServer - if true invalid URI data throws an Exception

Returns:

a **URIType** (p. 3339) instance containing the parsed data.

Exceptions:

URISyntaxException if forceServer is true and the URI is invalid.

6.718.3.9 void decaf::internal::net::URIHelper::validateAuthority (const std::string & *uri*, const std::string & *authority*, std::size_t *index*) throw (decaf::net::URISyntaxException)

Validate that the URI Authority Segment contains no invalid encodings.

Parameters:

uri - the full uri.

authority - the Authority to check.

index - position in the uri where Authority starts.

Exceptions:

URISyntaxException if the fragment has errors.

6.718.3.10 void decaf::internal::net::URIHelper::validateFragment (const std::string & *uri*, const std::string & *fragment*, std::size_t *index*) throw (decaf::net::URISyntaxException)

Validate that the URI fragment contains no invalid encodings.

Parameters:

uri - the full uri.

fragment - the fragment to check.

index - position in the uri where fragment starts.

Exceptions:

URISyntaxException if the fragment has errors.

6.718.3.11 void decaf::internal::net::URIHelper::validatePath (const std::string & *uri*, const std::string & *path*, std::size_t *index*) throw (decaf::net::URISyntaxException)

Validate that the URI Path Segment contains no invalid encodings.

Parameters:

uri - the full uri.

path - the path to check.

index - position in the uri where path starts.

Exceptions:

URISyntaxException if the fragment has errors.

6.718.3.12 void decaf::internal::net::URIHelper::validateQuery (const std::string & *uri*, const std::string & *query*, std::size_t *index*) throw (decaf::net::URISyntaxException)

Validate that the URI Query Segment contains no invalid encodings.

Parameters:

uri - the full uri.

query - the query to check.

index - position in the uri where fragment starts.

Exceptions:

URISyntaxException if the fragment has errors.

6.718.3.13 void decaf::internal::net::URIHelper::validateScheme (const std::string & *uri*, const std::string & *scheme*, int *index*) throw (decaf::net::URISyntaxException)

Validate the schema portin of the URI.

Parameters:

uri - the URI to check.

scheme - the schema section of the URI.

index - index in uri where schema starts.

Exceptions:

URISyntaxException if the fragment has errors.

6.718.3.14 void decaf::internal::net::URIHelper::validateSsp (const std::string & *uri*, const std::string & *ssp*, std::size_t *index*) throw (decaf::net::URISyntaxException)

Validate that the URI Ssp Segment contains no invalid encodings.

Parameters:

uri - the full uri.

ssp - the SSP to check.

index - position in the uri where Ssp starts.

Exceptions:

URISyntaxException if the fragment has errors.

6.718.3.15 void decaf::internal::net::URIHelper::validateUserinfo (const std::string & *uri*, const std::string & *userinfo*, std::size_t *index*) throw (decaf::net::URISyntaxException)

Check the supplied user info for validity.

Parameters:

uri - the uri to parse.

userinfo - supplied user info

index - index into the URI string where the data is located.

Returns:

true if valid

Exceptions:

URISyntaxException if an error occurs

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/**URIHelper.h**

6.719 activemq::transport::failover::URIPool Class Reference

`#include <src/main/activemq/transport/failover/URIPool.h>`

Public Member Functions

- **URIPool** ()

  Create an Empty URI Pool.

- **URIPool** (const **decaf::util::List**< **URI** > &uris)

  Creates a new URI Pool using the given list as the initial Free List.

- virtual ~**URIPool** ()
- **URI getURI** () throw (decaf::lang::exceptions::NoSuchElementException)

  Fetches the next available URI from the pool, if there are no more URIs free when this method is called it throws a NoSuchElementException.

- void **addURI** (const **URI** &uri)

  Adds a URI to the free list, callers that have previously taken one using the `getURI` method should always return the URI when they close the resource that was connected to that URI.

- void **addURIs** (const **StlList**< **URI** > &uris)

  Adds a List of URIs to this Pool, the method checks for duplicates already in the pool and does not add those.

- void **removeURI** (const **URI** &uri)

  Remove a given URI from the Free List.

- bool **isRandomize** () const

  Is the URI that is given randomly picked from the pool or is each one taken in sequence.

- void **setRandomize** (bool value)

  Sets if the URI's that are taken from the pool are chosen Randomly or are taken in the order they are in the list.

6.719.1 Constructor & Destructor Documentation

6.719.1.1 activemq::transport::failover::URIPool::URIPool ()

Create an Empty URI Pool.

6.719.1.2 activemq::transport::failover::URIPool::URIPool (const decaf::util::List< URI > & *uris*)

Creates a new URI Pool using the given list as the initial Free List.

Parameters:

uris - List of URI to place in the Pool.

6.719.1.3 virtual activemq::transport::failover::URIPool::~URIPool () [virtual]

6.719.2 Member Function Documentation

6.719.2.1 void activemq::transport::failover::URIPool::addURI (const URI & *uri*)

Adds a URI to the free list, callers that have previously taken one using the `getURI` method should always return the URI when they close the resource that was connected to that URI.

Parameters:

uri - a URI previously taken from the pool.

6.719.2.2 void activemq::transport::failover::URIPool::addURIs (const StlList< URI > & *uris*)

Adds a List of URIs to this Pool, the method checks for duplicates already in the pool and does not add those.

Parameters:

uris - List of URIs to add into the Pool.

6.719.2.3 URI activemq::transport::failover::URIPool::getURI () throw (decaf::lang::exceptions::NoSuchElementException)

Fetches the next available URI from the pool, if there are no more URIs free when this method is called it throws a NoSuchElementException. Receiving the exception is not an indication that a URI won't be available in the future, the caller should react accordingly.

Returns:

the next free URI in the Pool.

Exceptions:

NoSuchElementException if there are none free currently.

6.719.2.4 bool activemq::transport::failover::URIPool::isRandomize () const [inline]

Is the URI that is given randomly picked from the pool or is each one taken in sequence.

Returns:

true if URI gets are random.

6.719.2.5 void activemq::transport::failover::URIPool::removeURI (const URI & *uri*)

Remove a given URI from the Free List.

Parameters:

uri - the URI to find and remove from the free list

6.719.2.6 void activemq::transport::failover::URIPool::setRandomize (bool *value*) [inline]

Sets if the URI's that are taken from the pool are chosen Randomly or are taken in the order they are in the list.

Parameters:

value - true indicates URI gets are random.

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/**URIPool.h**

6.720 activemq::util::URISupport Class Reference

`#include <src/main/activemq/util/URISupport.h>`

Static Public Member Functions

- static void **parseURL** (const std::string &**URI**, **decaf::util::Properties** &properties) throw (decaf::lang::exceptions::IllegalArgumentException)

  Parses the properties out of the provided Broker URI and sets them in the passed Properties Object.

- static **CompositeData parseComposite** (const **URI** &uri) throw (decaf::net::URISyntaxException)

  Parses a Composite URI into a Composite Data instance, the Composite URI takes the for scheme://(uri1,uri2,...uriN)?param1=value1, each of the composite URIs is stored in the CompositeData's internal list.

- static **decaf::util::Properties parseQuery** (std::string query) throw (decaf::lang::exceptions::IllegalArgumentException)

  Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

- static void **parseQuery** (std::string query, **decaf::util::Properties** *properties) throw (decaf::lang::exceptions::IllegalArgumentException)

  Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

- static std::string **createQueryString** (const **Properties** &options) throw (decaf::net::URISyntaxException)

  Given a properties object create a string that can be appended to a URI as a valid Query string.

6.720.1 Member Function Documentation

6.720.1.1 static std::string activemq::util::URISupport::createQueryString (const Properties & *options*) throw (decaf::net::URISyntaxException) [static]

Given a properties object create a string that can be appended to a URI as a valid Query string.

Parameters:

options Properties object containing key / value query values.

Returns:

a valid URI query string.

Exceptions:

URISyntaxException if the string in the Properties object can't be encoded into a valid URI Query string.

6.720.1.2 static CompositeData activemq::util::URISupport::parseComposite (const URI & *uri*) throw (decaf::net::URISyntaxException) [static]

Parses a Composite URI into a Composite Data instance, the Composite URI takes the for scheme://(uri1,uri2,...uriN)?param1=value1, each of the composite URIs is stored in the CompositeData's internal list.

Parameters:

uri - The Composite URI to parse.

Returns:

a new **CompositeData** (p. 1088) object with the parsed data

Exceptions:

URISyntaxException if the URI is not well formed.

6.720.1.3 static void activemq::util::URISupport::parseQuery (std::string *query*, decaf::util::Properties * *properties*) throw (decaf::lang::exceptions::IllegalArgumentException) [static]

Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

Parameters:

query - the query string to parse.

properties - object pointer to get the parsed output.

Exceptions:

IllegalArgumentException if the Query string is not well formed.

6.720.1.4 static decaf::util::Properties activemq::util::URISupport::parseQuery (std::string *query*) throw (decaf::lang::exceptions::IllegalArgumentException) [static]

Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

Parameters:

query The query string to parse and extract the encoded properties.

Returns:

Properties object with the parsed output.

Exceptions:

IllegalArgumentException if the Query string is not well formed.

6.720.1.5 static void activemq::util::URISupport::parseURL (const std::string & *URI*, decaf::util::Properties & *properties*) throw (decaf::lang::exceptions::IllegalArgumentException) [static]

Parses the properties out of the provided Broker URI and sets them in the passed Properties Object.

Parameters:

URI a Broker URI to parse

properties a Properties object to set the parsed values in

Exceptions:

IllegalArgumentException if the passed URI is invalid

The documentation for this class was generated from the following file:

- src/main/activemq/util/**URISupport.h**

6.721 decaf::net::URISyntaxException Class Reference

`#include <src/main/decaf/net/URISyntaxException.h>`Inheritance diagram for decaf::net::URISyntaxException:

Public Member Functions

- **URISyntaxException** () throw ()
  Default Constructor.

  Constructor - Initializes the file name and line number where this message occurred.
- virtual **URISyntaxException** * **clone** () const
  Clones this exception.
- virtual ~**URISyntaxException** () throw ()
- std::string **getInput** () const
- std::string **getReason** () const
- std::size_t **getIndex** () const

6.721.1 Constructor & Destructor Documentation

6.721.1.1 decaf::net::URISyntaxException::URISyntaxException () throw () [inline]

Default Constructor.

6.721.1.2 decaf::net::URISyntaxException::URISyntaxException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.721.1.3 decaf::net::URISyntaxException::URISyntaxException (const URISyntaxException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.721.1.4 decaf::net::URISyntaxException::URISyntaxException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.721.1.5 decaf::net::URISyntaxException::URISyntaxException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.721.1.6 decaf::net::URISyntaxException::URISyntaxException (const char * *file*, const int *lineNumber*, const char *msg *DECAF_UNUSED*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.721.1.7 decaf::net::URISyntaxException::URISyntaxException (const char * *file*, const int *lineNumber*, const std::string & *input*, const std::string & *reason*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the input string that caused the error and the reason for the error.

Parameters:

file The file name where exception occurs.

lineNumber The line number where the exception occurred.

input The **URL** (p. 3347) that caused the exception.

reason The reason for the failure.

6.721.1.8 decaf::net::URISyntaxException::URISyntaxException (const char * *file*, const int *lineNumber*, const std::string & *input*, const std::string & *reason*, std::size_t *index*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the input string that caused the error and the reason for the error.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

input The input **URI** (p. 3308) that caused the exception

reason The reason for the failure.

index The index in the **URI** (p. 3308) string where the error occurred.

6.721.1.9 virtual decaf::net::URISyntaxException::~URISyntaxException () throw () [inline, virtual]

6.721.2 Member Function Documentation

6.721.2.1 virtual URISyntaxException* decaf::net::URISyntaxException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::lang::Exception** (p. 1577).

6.721.2.2 std::size_t decaf::net::URISyntaxException::getIndex () const [inline]

Returns:

the index in the input string where the error occured or -1

6.721.2.3 std::string decaf::net::URISyntaxException::getInput () const [inline]

Returns:

the Input string that cause this exception or ""

6.721.2.4 std::string decaf::net::URISyntaxException::getReason () const [inline]

Returns:

the Reason given for this failure, or ""

The documentation for this class was generated from the following file:

- src/main/decaf/net/**URISyntaxException.h**

6.722 decaf::internal::net::URIType Class Reference

Basic type object that holds data that composes a given URI.

`#include <src/main/decaf/internal/net/URIType.h>`

Public Member Functions

- **URIType** (const std::string &source)
- **URIType** ()
- virtual ~**URIType** ()
- std::string **getSource** () const

  Gets the source URI string that was parsed to obtain this ***URIType*** *(*p. *3339**) instance and the resulting data,.*

- void **setSource** (const std::string &source)

  Sets the source URI string that was parsed to obtain this ***URIType*** *(*p. *3339**) instance and the resulting data,.*

- std::string **getScheme** () const

  Gets the Scheme of the URI, e.g.

- void **setScheme** (const std::string &scheme)

  Sets the Scheme of the URI, e.g.

- std::string **getSchemeSpecificPart** () const

  Gets the Scheme Specific Part of the URI.

- void **setSchemeSpecificPart** (const std::string &schemeSpecificPart)

  Sets the Scheme Specific Part of the URI.

- std::string **getAuthority** () const

  Gets the Authority of the URI.

- void **setAuthority** (const std::string &authority)

  Sets the Authority of the URI.

- std::string **getUserInfo** () const

  Gets the user info part of the URI, e.g.

- void **setUserInfo** (const std::string &userinfo)

  Sets the user info part of the URI, e.g.

- std::string **getHost** () const

  Gets the Host name part of the URI.

- void **setHost** (const std::string &host)

  Sets the Host name part of the URI.

- int **getPort** () const

Gets the port part of the URI.

- void **setPort** (int port)

  Sets the port part of the URI.

- std::string **getPath** () const

  Gets the Path part of the URI.

- void **setPath** (const std::string &path)

  Sets the Path part of the URI.

- std::string **getQuery** () const

  Gets the Query part of the URI.

- void **setQuery** (const std::string &query)

  Sets the Query part of the URI.

- std::string **getFragment** () const

  Gets the Fragment part of the URI.

- void **setFragment** (const std::string &fragment)

  Sets the Fragment part of the URI.

- bool **isOpaque** () const

  Gets if the URI is Opaque.

- void **setOpaque** (bool opaque)

  Sets if the URI is Opaque.

- bool **isAbsolute** () const

  Gets if the URI is Absolute.

- void **setAbsolute** (bool absolute)

  Sets if the URI is Absolute.

- bool **isServerAuthority** () const

  Gets if the URI is a Server Authority.

- void **setServerAuthority** (bool serverAuthority)

  Sets if the URI is a Server Authority.

- bool **isValid** () const

  Gets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

- void **setValid** (bool valid)

  Sets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

6.722.1 Detailed Description

Basic type object that holds data that composes a given URI.

6.722.2 Constructor & Destructor Documentation

6.722.2.1 decaf::internal::net::URIType::URIType (const std::string & *source*) [inline]

6.722.2.2 decaf::internal::net::URIType::URIType () [inline]

6.722.2.3 virtual decaf::internal::net::URIType::~URIType () [inline, virtual]

6.722.3 Member Function Documentation

6.722.3.1 std::string decaf::internal::net::URIType::getAuthority () const [inline]

Gets the Authority of the URI.

Returns:

Authority part string.

6.722.3.2 std::string decaf::internal::net::URIType::getFragment () const [inline]

Gets the Fragment part of the URI.

Returns:

Fragment part string.

6.722.3.3 std::string decaf::internal::net::URIType::getHost () const [inline]

Gets the Host name part of the URI.

Returns:

Host name part string.

6.722.3.4 std::string decaf::internal::net::URIType::getPath () const [inline]

Gets the Path part of the URI.

Returns:

Path part string.

6.722.3.5 int decaf::internal::net::URIType::getPort () const [inline]

Gets the port part of the URI.

Returns:

port part string, -1 if not set.

6.722.3.6 std::string decaf::internal::net::URIType::getQuery () const [inline]

Gets the Query part of the URI.

Returns:

Query part string.

6.722.3.7 std::string decaf::internal::net::URIType::getScheme () const [inline]

Gets the Scheme of the URI, e.g. scheme ("http"/"ftp"/...).

Returns:

scheme part string.

6.722.3.8 std::string decaf::internal::net::URIType::getSchemeSpecificPart () const [inline]

Gets the Scheme Specific Part of the URI.

Returns:

scheme specific part string.

6.722.3.9 std::string decaf::internal::net::URIType::getSource () const [inline]

Gets the source URI string that was parsed to obtain this **URIType** (p. 3339) instance and the resulting data,.

Returns:

the source URI string

6.722.3.10 std::string decaf::internal::net::URIType::getUserInfo () const [inline]

Gets the user info part of the URI, e.g. user name, as in `http://user:passwd@host:port/`

Returns:

user info part string.

6.722.3.11 bool decaf::internal::net::URIType::isAbsolute () const [inline]

Gets if the URI is Absolute.

Returns:

true if Absolute.

6.722.3.12 bool decaf::internal::net::URIType::isOpaque () const [inline]

Gets if the URI is Opaque.

Returns:

true if opaque.

6.722.3.13 bool decaf::internal::net::URIType::isServerAuthority () const [inline]

Gets if the URI is a Server Authority.

Returns:

true if Server Authority.

6.722.3.14 bool decaf::internal::net::URIType::isValid () const [inline]

Gets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

Returns:

true if the **URIType** (p. 3339) contains valid data.

6.722.3.15 void decaf::internal::net::URIType::setAbsolute (bool *absolute*) [inline]

Sets if the URI is Absolute.

Parameters:

absolute - true if Absolute.

6.722.3.16 void decaf::internal::net::URIType::setAuthority (const std::string & *authority*) [inline]

Sets the Authority of the URI.

Parameters:

authority Authority part string.

6.722.3.17 void decaf::internal::net::URIType::setFragment (const std::string & *fragment*) [inline]

Sets the Fragment part of the URI.

Parameters:

fragment - Fragment part string.

6.722.3.18 void decaf::internal::net::URIType::setHost (const std::string & *host*) [inline]

Sets the Host name part of the URI.

Parameters:

host - Host name part string.

6.722.3.19 void decaf::internal::net::URIType::setOpaque (bool *opaque*) [inline]

Sets if the URI is Opaque.

Parameters:

opaque true if opaque.

6.722.3.20 void decaf::internal::net::URIType::setPath (const std::string & *path*) [inline]

Sets the Path part of the URI.

Parameters:

path - Path part string.

6.722.3.21 void decaf::internal::net::URIType::setPort (int *port*) [inline]

Sets the port part of the URI.

Parameters:

port - port part string, -1 if not set.

6.722.3.22 void decaf::internal::net::URIType::setQuery (const std::string & *query*) [inline]

Sets the Query part of the URI.

Parameters:

query - Query part string.

6.722.3.23 void decaf::internal::net::URIType::setScheme (const std::string & *scheme*) [inline]

Sets the Scheme of the URI, e.g. scheme ("http"/"ftp"/...).

Parameters:

scheme - scheme part string.

6.722.3.24 void decaf::internal::net::URIType::setSchemeSpecificPart (const std::string & *schemeSpecificPart*) [inline]

Sets the Scheme Specific Part of the URI.

Parameters:

schemeSpecificPart - scheme specific part string.

6.722.3.25 void decaf::internal::net::URIType::setServerAuthority (bool *serverAuthority*) [inline]

Sets if the URI is a Server Authority.

Parameters:

serverAuthority - true if Server Authority.

6.722.3.26 void decaf::internal::net::URIType::setSource (const std::string & *source*) [inline]

Sets the source URI string that was parsed to obtain this **URIType** (p. 3339) instance and the resulting data,.

Parameters:

source - the source URI string

6.722.3.27 void decaf::internal::net::URIType::setUserInfo (const std::string & *userinfo*) [inline]

Sets the user info part of the URI, e.g. user name, as in `http://user:passwd@host:port/`

Parameters:

userinfo - user info part string.

6.722.3.28 void decaf::internal::net::URIType::setValid (bool *valid*) [inline]

Sets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

Parameters:

valid - true if the **URIType** (p. 3339) contains valid data.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/**URIType.h**

6.723 decaf::net::URL Class Reference

Class **URL** (p. 3347) represents a Uniform Resource Locator, a pointer to a "resource" on the World Wide Web.

`#include <src/main/decaf/net/URL.h>`

Public Member Functions

- **URL** ()
- **URL** (const std::string &url)
- virtual ~**URL** ()

6.723.1 Detailed Description

Class **URL** (p. 3347) represents a Uniform Resource Locator, a pointer to a "resource" on the World Wide Web. A resource can be something as simple as a file or a directory, or it can be a reference to a more complicated object, such as a query to a database or to a search engine. More information on the types of URLs and their formats can be found at:

`http://www.ksc.nasa.gov/facts/internet/url-primer.html`

In general, a **URL** (p. 3347) can be broken into several parts. The previous example of a **URL** (p. 3347) indicates that the protocol to use is http (HyperText Transfer Protocol) and that the information resides on a host machine named www.ksc.nasa.gov. The information on that host machine is named /facts/internet/url-primer.html. The exact meaning of this name on the host machine is both protocol dependent and host dependent. The information normally resides in a file, but it could be generated on the fly. This component of the **URL** (p. 3347) is called the path component.

A **URL** (p. 3347) can optionally specify a "port", which is the port number to which the TCP connection is made on the remote host machine. If the port is not specified, the default port for the protocol is used instead. For example, the default port for http is 80. An alternative port could be specified as:

`http://www.ksc.nasa.gov:80/facts/internet/url-primer.html`

The syntax of **URL** (p. 3347) is defined by RFC 2396: Uniform Resource Identifiers (**URI** (p. 3308)): Generic Syntax, amended by RFC 2732: Format for Literal IPv6 Addresses in URLs. The Literal IPv6 address format also supports scope_ids. The syntax and usage of scope_ids is described here.

A **URL** (p. 3347) may have appended to it a "fragment", also known as a "ref" or a "reference". The fragment is indicated by the sharp sign character "#" followed by more characters. For example,

`http://www.apache.org/cms/index.html#chapter1`

This fragment is not technically part of the **URL** (p. 3347). Rather, it indicates that after the specified resource is retrieved, the application is specifically interested in that part of the document that has the tag chapter1 attached to it. The meaning of a tag is resource specific.

An application can also specify a "relative URL", which contains only enough information to reach the resource relative to another **URL** (p. 3347). Relative URLs are frequently used within HTML pages. For example, if the contents of the **URL** (p. 3347):

`http://www.apache.org/cms/index.html`

contained within it the relative **URL** (p. 3347):

FAQ.html

it would be a shorthand for:

`http://www.apache.org/cms/FAQ.html`

The relative **URL** (p. 3347) need not specify all the components of a **URL** (p. 3347). If the protocol, host name, or port number is missing, the value is inherited from the fully specified **URL** (p. 3347). The file component must be specified. The optional fragment is not inherited.

The **URL** (p. 3347) class does not itself encode or decode any **URL** (p. 3347) components according to the escaping mechanism defined in RFC2396. It is the responsibility of the caller to encode any fields, which need to be escaped prior to calling **URL** (p. 3347), and also to decode any escaped fields, that are returned from **URL** (p. 3347). Furthermore, because **URL** (p. 3347) has no knowledge of **URL** (p. 3347) escaping, it does not recognise equivalence between the encoded or decoded form of the same **URL** (p. 3347). For example, the two URLs:

`http://foo.com/hello` world/ and `http://foo.com/hello%20world`

would be considered not equal to each other.

Note, the **URI** (p. 3308) class does perform escaping of its component fields in certain circumstances. The recommended way to manage the encoding and decoding of URLs is to use **URI** (p. 3308), and to convert between these two classes using toURI() and **URI.toURL()** (p. 3318).

The **URLEncoder** (p. 3350) and **URLDecoder** (p. 3349) classes can also be used, but only for HTML form encoding, which is not the same as the encoding scheme defined in RFC2396.

6.723.2 Constructor & Destructor Documentation

Public Member Functions

- virtual ~**URLDecoder** ()

Static Public Member Functions

- static std::string **decode** (const std::string &value)

  Decodes the string argument which is assumed to be encoded in the ***x-www-form-urlencoded*** *MIME content type.*

6.724.1 Constructor & Destructor Documentation

6.724.1.1 virtual decaf::net::URLDecoder::~URLDecoder () [inline, virtual]

6.724.2 Member Function Documentation

6.724.2.1 static std::string decaf::net::URLDecoder::decode (const std::string & *value*) [static]

Decodes the string argument which is assumed to be encoded in the `x-www-form-urlencoded` MIME content type. '+' will be converted to space, '' and two following hex digit characters are converted to the equivalent byte value. All other characters are passed through unmodified.

e.g. "A+B+C %24%25" -> "A B C $%"

Parameters:

value - string The encoded string.

Returns:

The decoded version as a string.

The documentation for this class was generated from the following file:

- src/main/decaf/net/**URLDecoder.h**

6.725 decaf::net::URLEncoder Class Reference

`#include <src/main/decaf/net/URLEncoder.h>`

Public Member Functions

- virtual ~**URLEncoder** ()

Static Public Member Functions

- static std::string **encode** (const std::string &value)

  This class contains a utility method for converting a string to the format required by the ***application/x-www-form-urlencoded*** *MIME content type.*

6.725.1 Constructor & Destructor Documentation

6.725.1.1 virtual decaf::net::URLEncoder::~URLEncoder () [inline, virtual]

6.725.2 Member Function Documentation

6.725.2.1 static std::string decaf::net::URLEncoder::encode (const std::string & *value*) [static]

This class contains a utility method for converting a string to the format required by the `application/x-www-form-urlencoded` MIME content type. All characters except letters ('a'..'z', 'A'..'Z') and numbers ('0'..'9') and characters '.', '-', '*', '_' are converted into their hexidecimal value prepended by ''.

For example: '#' -> 23

In addition, spaces are substituted by '+'

Parameters:

value - the string to be converted

Returns:

the converted string

The documentation for this class was generated from the following file:

- src/main/decaf/net/**URLEncoder.h**

6.726 activemq::util::Usage Class Reference

`#include <src/main/activemq/util/Usage.h>`Inheritance diagram for activemq::util::Usage:

Public Member Functions

- virtual ~**Usage** ()
- virtual void **waitForSpace** ()=0

  Waits forever for more space to be returned to this ***Usage*** *(p. 3351) Manager.*

- virtual void **waitForSpace** (unsigned int timeout)=0

  Waits for more space to be returned to this ***Usage*** *(p. 3351) Manager, times out when the given time span in milliseconds elapses.*

- virtual void **enqueueUsage** (unsigned long long value)=0

  Tries to increase the usage by value amount but blocks if this object is currently full.

- virtual void **increaseUsage** (unsigned long long value)=0

  Increases the usage by the value amount.

- virtual void **decreaseUsage** (unsigned long long value)=0

  Decreases the usage by the value amount.

- virtual bool **isFull** () const =0

  Returns true if this ***Usage*** *(p. 3351) instance is full, i.e.*

6.726.1 Constructor & Destructor Documentation

6.726.1.1 virtual activemq::util::Usage::~Usage () `[inline, virtual]`

6.726.2 Member Function Documentation

6.726.2.1 virtual void activemq::util::Usage::decreaseUsage (unsigned long long *value*) `[pure virtual]`

Decreases the usage by the value amount.

Parameters:

value Amount of space to return to the pool

Implemented in **activemq::util::MemoryUsage** (p. 2142).

6.726.2.2 virtual void activemq::util::Usage::enqueueUsage (unsigned long long *value*) `[pure virtual]`

Tries to increase the usage by value amount but blocks if this object is currently full.

Parameters:

value Amount of usage in bytes to add.

Implemented in **activemq::util::MemoryUsage** (p. 2142).

6.726.2.3 virtual void activemq::util::Usage::increaseUsage (unsigned long long *value*) [pure virtual]

Increases the usage by the value amount.

Parameters:

value Amount of usage to add.

Implemented in **activemq::util::MemoryUsage** (p. 2143).

6.726.2.4 virtual bool activemq::util::Usage::isFull () const [pure virtual]

Returns true if this **Usage** (p. 3351) instance is full, i.e. **Usage** (p. 3351) >= 100%

Returns:

true if **Usage** (p. 3351) is at the Full point.

Implemented in **activemq::util::MemoryUsage** (p. 2143).

6.726.2.5 virtual void activemq::util::Usage::waitForSpace (unsigned int *timeout*) [pure virtual]

Waits for more space to be returned to this **Usage** (p. 3351) Manager, times out when the given time span in milliseconds elapses.

Parameters:

timeout The time to wait for more space.

Implemented in **activemq::util::MemoryUsage** (p. 2143).

6.726.2.6 virtual void activemq::util::Usage::waitForSpace () [pure virtual]

Waits forever for more space to be returned to this **Usage** (p. 3351) Manager.

Implemented in **activemq::util::MemoryUsage** (p. 2144).

The documentation for this class was generated from the following file:

- src/main/activemq/util/**Usage.h**

6.727 decaf::io::UTFDataFormatException Class Reference

Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered.

`#include <src/main/decaf/io/UTFDataFormatException.h>`Inheritance diagram for decaf::io::UTFDataFormatException:

Public Member Functions

- **UTFDataFormatException** () throw ()
  Default Constructor.
- **UTFDataFormatException** (const **lang::Exception** &ex) throw ()
  Copy Constructor.
- **UTFDataFormatException** (const **UTFDataFormatException** &ex) throw ()
  Copy Constructor.
- **UTFDataFormatException** (const char *file, const int lineNumber, const std::exception ***cause**, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- **UTFDataFormatException** (const std::exception ***cause**) throw ()
  Constructor.
- **UTFDataFormatException** (const char *file, const int lineNumber, const char *msg,...) throw ()
  Constructor.
- virtual **UTFDataFormatException** * **clone** () const
  Clones this exception.
- virtual ~**UTFDataFormatException** () throw ()

6.727.1 Detailed Description

Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered.

Since:

1.0

6.727.2 Constructor & Destructor Documentation

6.727.2.1 decaf::io::UTFDataFormatException::UTFDataFormatException () throw () [inline]

Default Constructor.

6.727.2.2 decaf::io::UTFDataFormatException::UTFDataFormatException (const lang::Exception & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex the exception to copy

6.727.2.3 decaf::io::UTFDataFormatException::UTFDataFormatException (const UTFDataFormatException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex the exception to copy, which is an instance of this type

6.727.2.4 decaf::io::UTFDataFormatException::UTFDataFormatException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.727.2.5 decaf::io::UTFDataFormatException::UTFDataFormatException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.727.2.6 decaf::io::UTFDataFormatException::UTFDataFormatException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.727.2.7 virtual decaf::io::UTFDataFormatException::~UTFDataFormatException () throw () [inline, virtual]

6.727.3 Member Function Documentation

6.727.3.1 virtual UTFDataFormatException* decaf::io::UTFDataFormatException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A new instance of an Exception object that is a copy of this instance.

Reimplemented from **decaf::io::IOException** (p. 1822).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**UTFDataFormatException.h**

6.728 decaf::util::UUID Class Reference

A class that represents an immutable universally unique identifier (**UUID** (p. 3356)).

`#include <src/main/decaf/util/UUID.h>`Inheritance diagram for decaf::util::UUID:

Public Member Functions

- **UUID** (long long mostSigBits, long long leastSigBits)

  *Constructs a new **UUID** (p. 3356) using the specified data.*

- virtual ~**UUID** ()
- virtual int **compareTo** (const **UUID** &value) const

  *Compare the given **UUID** (p. 3356) to this one.*

- virtual bool **equals** (const **UUID** &value) const

  *Compares this **UUID** (p. 3356) to the one given, returns true if they are equal.*

- virtual bool **operator==** (const **UUID** &value) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const **UUID** &value) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- virtual std::string **toString** () const

  *Returns a String object representing this **UUID** (p. 3356).*

- virtual long long **getLeastSignificantBits** () const
- virtual long long **getMostSignificantBits** () const
- virtual long long **node** () throw (lang::exceptions::UnsupportedOperationException)

  *The node value associated with this **UUID** (p. 3356).*

- virtual long long **timestamp** () throw (lang::exceptions::UnsupportedOperationException)

  *The timestamp value associated with this **UUID** (p. 3356).*

- virtual int **clockSequence** () throw (lang::exceptions::UnsupportedOperationException)

  *The clock sequence value associated with this **UUID** (p. 3356).*

- virtual int **variant** () throw (lang::exceptions::UnsupportedOperationException)

  *The variant number associated with this **UUID** (p. 3356).*

- virtual int **version** () throw (lang::exceptions::UnsupportedOperationException)

  *The version number associated with this **UUID** (p. 3356).*

Static Public Member Functions

- static **UUID randomUUID** ()

  Static factory to retrieve a type 4 (pseudo randomly generated) ***UUID*** *(p. 3356).*

- static **UUID nameUUIDFromBytes** (const std::vector< char > &name)

  Static factory to retrieve a type 3 (name based) ***UUID*** *(p. 3356) based on the specified byte array.*

- static **UUID nameUUIDFromBytes** (const char *name, std::size_t size)

  Static factory to retrieve a type 3 (name based) ***UUID*** *(p. 3356) based on the specified byte array.*

- static **UUID fromString** (const std::string &name) throw (lang::exceptions::IllegalArgumentException)

  Creates a ***UUID*** *(p. 3356) from the string standard representation as described in the* ***toString()*** *(p. 3361) method.*

6.728.1 Detailed Description

A class that represents an immutable universally unique identifier (**UUID** (p. 3356)). A **UUID** (p. 3356) represents a 128-bit value.

There exist different variants of these global identifiers. The methods of this class are for manipulating the Leach-Salz variant, although the constructors allow the creation of any variant of **UUID** (p. 3356) (described below).

The layout of a variant 2 (Leach-Salz) **UUID** (p. 3356) is as follows: The most significant long consists of the following unsigned fields:

0xFFFFFFFF00000000 time_low 0x00000000FFFF0000 time_mid 0x000000000000F000 version 0x0000000000000FFF time_hi

The least significant long consists of the following unsigned fields:

0xC000000000000000 variant 0x3FFF000000000000 clock_seq 0x0000FFFFFFFFFFFF node

The variant field contains a value which identifies the layout of the **UUID** (p. 3356). The bit layout described above is valid only for a **UUID** (p. 3356) with a variant value of 2, which indicates the Leach-Salz variant.

The version field holds a value that describes the type of this **UUID** (p. 3356). There are four different basic types of UUIDs: time-based, DCE security, name-based, and randomly generated UUIDs. These types have a version value of 1, 2, 3 and 4, respectively.

For more information including algorithms used to create UUIDs, see the Internet-Draft UUIDs and GUIDs or the standards body definition at ISO/IEC 11578:1996.

6.728.2 Constructor & Destructor Documentation

6.728.2.1 decaf::util::UUID::UUID (long long *mostSigBits*, long long *leastSigBits*)

Constructs a new **UUID** (p. 3356) using the specified data. mostSigBits is used for the most significant 64 bits of the **UUID** (p. 3356) and leastSigBits becomes the least significant 64 bits of the **UUID** (p. 3356).

Parameters:

mostSigBits

leastSigBits

6.728.2.2 virtual decaf::util::UUID::~UUID () [virtual]

6.728.3 Member Function Documentation

6.728.3.1 virtual int decaf::util::UUID::clockSequence () throw (lang::exceptions::UnsupportedOperationException) [virtual]

The clock sequence value associated with this **UUID** (p. 3356). The 14 bit clock sequence value is constructed from the clock sequence field of this **UUID** (p. 3356). The clock sequence field is used to guarantee temporal uniqueness in a time-based **UUID** (p. 3356).

The clockSequence value is only meaningful in a time-based **UUID** (p. 3356), which has version type 1. If this **UUID** (p. 3356) is not a time-based **UUID** (p. 3356) then this method throws UnsupportedOperationException.

Returns:

the clockSequeunce associated with a V1 **UUID** (p. 3356)

Exceptions:

UnsupportedOperationException

6.728.3.2 virtual int decaf::util::UUID::compareTo (const UUID & *value*) const [virtual]

Compare the given **UUID** (p. 3356) to this one.

Parameters:

value - the **UUID** (p. 3356) to compare to

6.728.3.3 virtual bool decaf::util::UUID::equals (const UUID & *value*) const [virtual]

Compares this **UUID** (p. 3356) to the one given, returns true if they are equal.

Parameters:

value - the **UUID** (p. 3356) to compare to.

Returns:

true if UUIDs are the same.

6.728.3.4 static UUID decaf::util::UUID::fromString (const std::string & *name*) throw (lang::exceptions::IllegalArgumentException) [static]

Creates a **UUID** (p. 3356) from the string standard representation as described in the **toString()** (p. 3361) method.

Parameters:

name - a string to be used to construct a **UUID** (p. 3356).

Returns:

type 3 **UUID** (p. 3356)

6.728.3.5 virtual long long decaf::util::UUID::getLeastSignificantBits () const [virtual]

Returns:

the most significant 64 bits of this UUID's 128 bit value.

6.728.3.6 virtual long long decaf::util::UUID::getMostSignificantBits () const [virtual]

Returns:

the most significant 64 bits of this UUID's 128 bit value.

6.728.3.7 static UUID decaf::util::UUID::nameUUIDFromBytes (const char * *name*, std::size_t *size*) [static]

Static factory to retrieve a type 3 (name based) **UUID** (p. 3356) based on the specified byte array.

Parameters:

name - a byte array to be used to construct a **UUID** (p. 3356).

size - the size of the byte array, or number of bytes to use.

Returns:

type 3 **UUID** (p. 3356)

6.728.3.8 static UUID decaf::util::UUID::nameUUIDFromBytes (const std::vector< char > & *name*) [static]

Static factory to retrieve a type 3 (name based) **UUID** (p. 3356) based on the specified byte array.

Parameters:

name - a byte array to be used to construct a **UUID** (p. 3356).

Returns:

type 3 **UUID** (p. 3356)

6.728.3.9 virtual long long decaf::util::UUID::node () throw (lang::exceptions::UnsupportedOperationException) [virtual]

The node value associated with this **UUID** (p. 3356). The 48 bit node value is constructed from the node field of this **UUID** (p. 3356). This field is intended to hold the IEEE 802 address of the machine that generated this **UUID** (p. 3356) to guarantee spatial uniqueness.

The node value is only meaningful in a time-based **UUID** (p. 3356), which has version type 1. If this **UUID** (p. 3356) is not a time-based **UUID** (p. 3356) then this method throws UnsupportedOperationException.

Returns:

the node value of this **UUID** (p. 3356)

Exceptions:

UnsupportedOperationException

6.728.3.10 virtual bool decaf::util::UUID::operator< (const UUID & *value*) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.728.3.11 virtual bool decaf::util::UUID::operator== (const UUID & *value*) const [virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.728.3.12 static UUID decaf::util::UUID::randomUUID () [static]

Static factory to retrieve a type 4 (pseudo randomly generated) **UUID** (p. 3356). The **UUID** (p. 3356) is generated using a cryptographically strong pseudo random number generator.

Returns:

type 4 **UUID** (p. 3356)

6.728.3.13 virtual long long decaf::util::UUID::timestamp () throw (lang::exceptions::UnsupportedOperationException) [virtual]

The timestamp value associated with this **UUID** (p. 3356). The 60 bit timestamp value is constructed from the time_low, time_mid, and time_hi fields of this **UUID** (p. 3356). The resulting timestamp is measured in 100-nanosecond units since midnight, October 15, 1582 UTC.

The timestamp value is only meaningful in a time-based **UUID** (p. 3356), which has version type 1. If this **UUID** (p. 3356) is not a time-based **UUID** (p. 3356) then this method throws UnsupportedOperationException.

Returns:

the timestamp associated with a V1 **UUID** (p. 3356)

Exceptions:

UnsupportedOperationException

6.728.3.14 virtual std::string decaf::util::UUID::toString () const [virtual]

Returns a String object representing this **UUID** (p. 3356). UUID's are formatted as: 00112233-4455-6677-8899-AABBCCDDEEFF whose length is 36.

Returns:

formatted string for this **UUID** (p. 3356)

6.728.3.15 virtual int decaf::util::UUID::variant () throw (lang::exceptions::UnsupportedOperationException) [virtual]

The variant number associated with this **UUID** (p. 3356). The variant number describes the layout of the **UUID** (p. 3356). The variant number has the following meaning:

∗ 0 Reserved for NCS backward compatibility ∗ 2 The Leach-Salz variant (used by this class) ∗ 6 Reserved, Microsoft Corporation backward compatibility ∗ 7 Reserved for future definition

Returns:

the variant associated with a V1 **UUID** (p. 3356)

Exceptions:

UnsupportedOperationException

6.728.3.16 virtual int decaf::util::UUID::version () throw (lang::exceptions::UnsupportedOperationException) [virtual]

The version number associated with this **UUID** (p. 3356). The version number describes how this **UUID** (p. 3356) was generated. The version number has the following meaning:

∗ 1 Time-based **UUID** (p. 3356) ∗ 2 DCE security **UUID** (p. 3356) ∗ 3 Name-based **UUID** (p. 3356) ∗ 4 Randomly generated **UUID** (p. 3356)

Returns:

the version associated with a V1 **UUID** (p. 3356)

Exceptions:

UnsupportedOperationException

6.729 activemq::wireformat::WireFormat Class Reference

Provides a mechanism to marshal commands into and out of packets or into and out of streams, Channels and Datagrams.

`#include <src/main/activemq/wireformat/WireFormat.h>`Inheritance diagram for activemq::wireformat::WireFormat:

Public Member Functions

- virtual ~**WireFormat** ()
- virtual void **marshal** (const **Pointer**< **commands::Command** > &command, const **activemq::transport::Transport** *transport, **decaf::io::DataOutputStream** *out)=0 throw (decaf::io::IOException)

  Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

- virtual **Pointer**< **commands::Command** > **unmarshal** (const **activemq::transport::Transport** *transport, **decaf::io::DataInputStream** *in)=0 throw (decaf::io::IOException)

  Stream based unmarshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.

- virtual void **setVersion** (int version)=0

  Set the Version.

- virtual int **getVersion** () const =0

  Get the Version.

- virtual bool **hasNegotiator** () const =0

  *Returns true if this **WireFormat** (p. 3363) has a Negotiator that needs to wrap the Transport that uses it.*

- virtual bool **inReceive** () const =0

  Indicates if the WireFromat object is in the process of receiving a message.

- virtual **Pointer**< **transport::Transport** > **createNegotiator** (const **Pointer**< **transport::Transport** > &transport)=0 throw (decaf::lang::exceptions::UnsupportedOperationException)

  If the Transport Provides a Negotiator this method will create and return a new instance of the Negotiator.

6.729.1 Detailed Description

Provides a mechanism to marshal commands into and out of packets or into and out of streams, Channels and Datagrams.

6.729.2 Constructor & Destructor Documentation

6.729.2.1 virtual activemq::wireformat::WireFormat::~WireFormat () [inline, virtual]

6.729.3 Member Function Documentation

6.729.3.1 virtual Pointer<transport::Transport> activemq::wireformat::WireFormat::createNegotiator (const Pointer< transport::Transport > & *transport*) throw (decaf::lang::exceptions::UnsupportedOperationException) [pure virtual]

If the Transport Provides a Negotiator this method will create and return a new instance of the Negotiator.

Parameters:

transport - the Transport to Wrap the Negotiator around.

Returns:

new instance of a **WireFormatNegotiator** (p. 3399) as a **Pointer<Transport>** (p. 2497).

Exceptions:

UnsupportedOperationException if the **WireFormat** (p. 3363) doesn't have a Negotiator.

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2451), and **activemq::wireformat::stomp::StompWireFormat** (p. 3072).

6.729.3.2 virtual int activemq::wireformat::WireFormat::getVersion () const [pure virtual]

Get the Version.

Returns:

the version of the wire format

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2453), and **activemq::wireformat::stomp::StompWireFormat** (p. 3072).

6.729.3.3 virtual bool activemq::wireformat::WireFormat::hasNegotiator () const [pure virtual]

Returns true if this **WireFormat** (p. 3363) has a Negotiator that needs to wrap the Transport that uses it.

Returns:

true if the **WireFormat** (p. 3363) provides a Negotiator.

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2453), and **activemq::wireformat::stomp::StompWireFormat** (p. 3072).

6.729.3.4 virtual bool activemq::wireformat::WireFormat::inReceive () const [pure virtual]

Indicates if the WireFromat object is in the process of receiving a message. This is useful for monitoring inactivity and the **WireFormat** (p. 3363) is processing a large message which takes longer than some configured timeout to unmarshal, the inactivity monitor can query the **WireFormat** (p. 3363) instance to determine if its busy or not and not mark the connection as inactive if so.

Returns:

true if the **WireFormat** (p. 3363) object is unmarshaling a message.

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2453), and **activemq::wireformat::stomp::StompWireFormat** (p. 3073).

6.729.3.5 virtual void activemq::wireformat::WireFormat::marshal (const Pointer< commands::Command > & *command*, const activemq::transport::Transport * *transport*, decaf::io::DataOutputStream * *out*) throw (decaf::io::IOException) [pure virtual]

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

Parameters:

command The Command to Marshal

transport The Transport that called this method.

out The output stream to write the command to.

Exceptions:

IOException

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2455), and **activemq::wireformat::stomp::StompWireFormat** (p. 3073).

6.729.3.6 virtual void activemq::wireformat::WireFormat::setVersion (int *version*) [pure virtual]

Set the Version.

Parameters:

version the version of the wire format

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2457), and **activemq::wireformat::stomp::StompWireFormat** (p. 3073).

6.729.3.7 virtual Pointer<commands::Command> activemq::wireformat::WireFormat::unmarshal (const activemq::transport::Transport * *transport*, decaf::io::DataInputStream * *in*) throw (decaf::io::IOException) [pure virtual]

Stream based unmarshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form. Returns a Pointer to the newly unmarshaled Command.

Parameters:

transport - Pointer to the transport that is making this request.

in - the input stream to read the command from.

Returns:

the newly marshaled Command, caller owns the pointer

Exceptions:

IOException

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2459), and **activemq::wireformat::stomp::StompWireFormat** (p. 3073).

The documentation for this class was generated from the following file:

6.730 activemq::wireformat::WireFormatFactory Class Reference

The **WireFormatFactory** (p. 3367) is the interface that all **WireFormatFactory** (p. 3367) classes must extend.

`#include <src/main/activemq/wireformat/WireFormatFactory.h>`Inheritance diagram for activemq::wireformat::WireFormatFactory:

Public Member Functions

- virtual ~**WireFormatFactory** ()
- virtual **Pointer**< **WireFormat** > **createWireFormat** (const **decaf::util::Properties** &properties)=0 throw (decaf::lang::exceptions::IllegalStateException)

  *Creates a new **WireFormat** (p. 3363) Object passing it a set of properties from which it can obtain any optional settings.*

6.730.1 Detailed Description

The **WireFormatFactory** (p. 3367) is the interface that all **WireFormatFactory** (p. 3367) classes must extend. The Factory creates a **WireFormat** (p. 3363) Object based on the properties that are set in the passed `Properties` object.

6.730.2 Constructor & Destructor Documentation

6.730.2.1 virtual activemq::wireformat::WireFormatFactory::~WireFormatFactory () [inline, virtual]

6.730.3 Member Function Documentation

6.730.3.1 virtual Pointer<WireFormat> activemq::wireformat::WireFormatFactory::createWireFormat (const decaf::util::Properties & *properties*) throw (decaf::lang::exceptions::IllegalStateException) [pure virtual]

Creates a new **WireFormat** (p. 3363) Object passing it a set of properties from which it can obtain any optional settings.

Parameters:

properties - the Properties for this **WireFormat** (p. 3363)

Returns:

Pointer to a new instance of a **WireFormat** (p. 3363) object.

Implemented in **activemq::wireformat::openwire::OpenWireFormatFactory** (p. 2460), and **activemq::wireformat::stomp::StompWireFormatFactory** (p. 3075).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/**WireFormatFactory.h**

6.731 activemq::commands::WireFormatInfo Class Reference

`#include <src/main/activemq/commands/WireFormatInfo.h>`Inheritance diagram for activemq::commands::WireFormatInfo:

Public Member Functions

- **WireFormatInfo** ()
- virtual ~**WireFormatInfo** ()
- virtual unsigned char **getDataStructureType** () const

  Get the unique identifier that this object and its own Marshaler share.

- virtual **DataStructure** * **cloneDataStructure** () const

  Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

  Copy the contents of the passed object into this objects members, overwriting any existing data.

- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure*** (p. *1461) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure*** (p. *1461) passed in to this one, and returns if they are equivalent.*

- virtual bool **isMarshalAware** () const

  Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.

- virtual **decaf::lang::Pointer**< **commands::Command** > **visit** (**activemq::state::CommandVisitor** *visitor) throw (exceptions::ActiveMQException)

  Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

- int **getVersion** () const

  Get the current Wireformat Version.

- void **setVersion** (int version)

  Set the current Wireformat Version.

- long long **getMaxInactivityDuration** () const

  Returns the currently configured Max Inactivity duration.

- void **setMaxInactivityDuration** (long long maxInactivityDuration)

  Sets the Max inactivity duration value.

- long long **getMaxInactivityDurationInitalDelay** () const

  Returns the currently configured Max Inactivity Intial Delay duration.

- void **setMaxInactivityDurationInitalDelay** (long long maxInactivityDurationInitalDelay)

  Sets the Max inactivity initial delay duration value.

- bool **isStackTraceEnabled** () const

  Checks if the stackTraceEnabled flag is on.

- void **setStackTraceEnabled** (bool stackTraceEnabled)

  Sets if the stackTraceEnabled flag is on.

- bool **isTcpNoDelayEnabled** () const

  Checks if the tcpNoDelayEnabled flag is on.

- void **setTcpNoDelayEnabled** (bool tcpNoDelayEnabled)

  Sets if the tcpNoDelayEnabled flag is on.

- bool **isCacheEnabled** () const

  Checks if the cacheEnabled flag is on.

- void **setCacheEnabled** (bool cacheEnabled)

  Sets if the cacheEnabled flag is on.

- int **getCacheSize** () const

  Gets the Cache Size setting.

- void **setCacheSize** (int value)

  Sets the Cache Size setting.

- bool **isTightEncodingEnabled** () const

  Checks if the tightEncodingEnabled flag is on.

- void **setTightEncodingEnabled** (bool tightEncodingEnabled)

  Sets if the tightEncodingEnabled flag is on.

- bool **isSizePrefixDisabled** () const

  Checks if the sizePrefixDisabled flag is on.

- void **setSizePrefixDisabled** (bool sizePrefixDisabled)

  Sets if the sizePrefixDisabled flag is on.

- const std::vector< unsigned char > & **getMagic** () const

  Get the Magic field.

- void **setMagic** (const std::vector< unsigned char > &magic)

  Sets the value of the magic field.

- const std::vector< unsigned char > & **getMarshalledProperties** () const

  Get the marshalledProperties field.

- void **setMarshalledProperties** (const std::vector< unsigned char > &marshalledProperties)

  Sets the value of the marshalledProperties field.

- virtual const **util::PrimitiveMap** & **getProperties** () const

  Gets the Properties for this ***Command*** *(*p. *1063**).*

- virtual **util::PrimitiveMap** & **getProperties** ()

  Gets the Properties for this ***Command*** *(*p. *1063**).*

- virtual void **setProperties** (const **util::PrimitiveMap** &map)

  Sets the Properties for this ***Command*** *(*p. *1063**).*

- bool **isValid** () const

  Determines if we think this is a Valid ***WireFormatInfo*** *(*p. *3369**) command.*

- virtual bool **isWireFormatInfo** () const
- virtual void **beforeMarshal** (**wireformat::WireFormat** *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)

  Handles the marshaling of the objects properties into the internal byte array before the object is marshalled to the wire.

- virtual void **afterUnmarshal** (**wireformat::WireFormat** *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)

  Called after unmarshaling is started to cleanup the object being unmarshaled.

Static Public Attributes

- static const unsigned char **ID_WIREFORMATINFO** = 1

6.731.1 Constructor & Destructor Documentation

6.731.1.1 activemq::commands::WireFormatInfo::WireFormatInfo ()

6.731.1.2 virtual activemq::commands::WireFormatInfo::~WireFormatInfo () [virtual]

6.731.2 Member Function Documentation

6.731.2.1 virtual void activemq::commands::WireFormatInfo::afterUnmarshal (wireformat::WireFormat *wireFormat *AMQCPP_UNUSED*) throw (decaf::io::IOException) [virtual]

Called after unmarshaling is started to cleanup the object being unmarshaled.

Parameters:

wireFormat - the wireformat object to control unmarshaling

Reimplemented from **activemq::commands::BaseDataStructure** (p. 716).

6.731.2.2 virtual void activemq::commands::WireFormatInfo::beforeMarshal (wireformat::WireFormat *wireFormat *AMQCPP_ UNUSED*) throw (decaf::io::IOException) [virtual]

Handles the marshaling of the objects properties into the internal byte array before the object is marshalled to the wire.

Parameters:

wireFormat - the wire formatting controller

Reimplemented from **activemq::commands::BaseDataStructure** (p. 716).

6.731.2.3 virtual DataStructure* activemq::commands::WireFormatInfo::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.731.2.4 virtual void activemq::commands::WireFormatInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.731.2.5 virtual bool activemq::commands::WireFormatInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.731.2.6 int activemq::commands::WireFormatInfo::getCacheSize () const

Gets the Cache Size setting.

Returns:

currently set cache size.

6.731.2.7 virtual unsigned char activemq::commands::WireFormatInfo::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.731.2.8 const std::vector<unsigned char>& activemq::commands::WireFormatInfo::getMagic () const [inline]

Get the Magic field.

Returns:

const reference to a std::vector<char>

6.731.2.9 const std::vector<unsigned char>& activemq::commands::WireFormatInfo::getMarshalledProperties () const [inline]

Get the marshalledProperties field.

Returns:

const reference to a std::vector<char>

6.731.2.10 long long activemq::commands::WireFormatInfo::getMaxInactivityDuration () const

Returns the currently configured Max Inactivity duration.

Returns:

the set inactivity duration value.

6.731.2.11 long long activemq::commands::WireFormatInfo::getMaxInactivityDurationInitalDelay () const

Returns the currently configured Max Inactivity Intial Delay duration.

Returns:

the set inactivity duration initial delay value.

6.731.2.12 virtual util::PrimitiveMap& activemq::commands::WireFormatInfo::getProperties () [inline, virtual]

Gets the Properties for this **Command** (p. 1063).

Returns:

the Properties object for this **Command** (p. 1063).

6.731.2.13 virtual const util::PrimitiveMap& activemq::commands::WireFormatInfo::getProperties () const [inline, virtual]

Gets the Properties for this **Command** (p. 1063).

Returns:

the Properties object for this **Command** (p. 1063).

6.731.2.14 int activemq::commands::WireFormatInfo::getVersion () const [inline]

Get the current Wireformat Version.

Returns:

int that identifies the version

6.731.2.15 bool activemq::commands::WireFormatInfo::isCacheEnabled () const

Checks if the cacheEnabled flag is on.

Returns:

true if the flag is on.

6.731.2.16 virtual bool activemq::commands::WireFormatInfo::isMarshalAware () const [inline, virtual]

Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.

Returns:

boolean indicating desire to be in marshaling stages

Reimplemented from **activemq::commands::BaseDataStructure** (p. 717).

6.731.2.17 bool activemq::commands::WireFormatInfo::isSizePrefixDisabled () const

Checks if the sizePrefixDisabled flag is on.

Returns:

true if the flag is on.

6.731.2.18 bool activemq::commands::WireFormatInfo::isStackTraceEnabled () const

Checks if the stackTraceEnabled flag is on.

Returns:

true if the flag is on.

6.731.2.19 bool activemq::commands::WireFormatInfo::isTcpNoDelayEnabled () const

Checks if the tcpNoDelayEnabled flag is on.

Returns:

true if the flag is on.

6.731.2.20 bool activemq::commands::WireFormatInfo::isTightEncodingEnabled () const

Checks if the tightEncodingEnabled flag is on.

Returns:

true if the flag is on.

6.731.2.21 bool activemq::commands::WireFormatInfo::isValid () const

Determines if we think this is a Valid **WireFormatInfo** (p. 3369) command.

Returns:

true if its valid.

6.731.2.22 virtual bool activemq::commands::WireFormatInfo::isWireFormatInfo () const [inline, virtual]

Returns:

answers true to the isWireFormatInfo query

Reimplemented from **activemq::commands::BaseCommand** (p. 655).

6.731.2.23 void activemq::commands::WireFormatInfo::setCacheEnabled (bool *cacheEnabled*)

Sets if the cacheEnabled flag is on.

Parameters:

cacheEnabled - true to turn flag is on

6.731.2.24 void activemq::commands::WireFormatInfo::setCacheSize (int *value*)

Sets the Cache Size setting.

Parameters:

value - value to set to the cache size.

6.731.2.25 void activemq::commands::WireFormatInfo::setMagic (const std::vector< unsigned char > & *magic*) [inline]

Sets the value of the magic field.

Parameters:

magic - const std::vector<char>

6.731.2.26 void activemq::commands::WireFormatInfo::setMarshalledProperties (const std::vector< unsigned char > & *marshalledProperties*) [inline]

Sets the value of the marshalledProperties field.

Parameters:

marshalledProperties The Byte Array vector that contains the marshaled form of the **Message** (p. 2145) properties, this is the data sent over the wire.

6.731.2.27 void activemq::commands::WireFormatInfo::setMaxInactivityDuration (long long *maxInactivityDuration*)

Sets the Max inactivity duration value.

Parameters:

maxInactivityDuration - max time a client can be inactive.

6.731.2.28 void activemq::commands::WireFormatInfo::setMaxInactivityDurationInitalDelay (long long *maxInactivityDurationInitalDelay*)

Sets the Max inactivity initial delay duration value.

Parameters:

maxInactivityDurationInitalDelay - time before the inactivity delay is checked.

6.731.2.29 virtual void activemq::commands::WireFormatInfo::setProperties (const util::PrimitiveMap & *map*) [inline, virtual]

Sets the Properties for this **Command** (p. 1063).

Parameters:

map - PrimtiveMap to copy

6.731.2.30 void activemq::commands::WireFormatInfo::setSizePrefixDisabled (bool *sizePrefixDisabled*)

Sets if the sizePrefixDisabled flag is on.

Parameters:

sizePrefixDisabled - true to turn flag is on

6.731.2.31 void activemq::commands::WireFormatInfo::setStackTraceEnabled (bool *stackTraceEnabled*)

Sets if the stackTraceEnabled flag is on.

Parameters:

stackTraceEnabled - ture to turn flag is on

6.731.2.32 void activemq::commands::WireFormatInfo::setTcpNoDelayEnabled (bool *tcpNoDelayEnabled*)

Sets if the tcpNoDelayEnabled flag is on.

Parameters:

tcpNoDelayEnabled - ture to turn flag is on

6.731.2.33 void activemq::commands::WireFormatInfo::setTightEncodingEnabled (bool *tightEncodingEnabled*)

Sets if the tightEncodingEnabled flag is on.

Parameters:

tightEncodingEnabled - true to turn flag is on

6.731.2.34 void activemq::commands::WireFormatInfo::setVersion (int *version*) [inline]

Set the current Wireformat Version.

Parameters:

version - int that identifies the version

6.731.2.35 virtual std::string activemq::commands::WireFormatInfo::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 655).

6.731.2.36 virtual decaf::lang::Pointer<commands::Command> activemq::commands::WireFormatInfo::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1067).

6.731.3 Field Documentation

6.731.3.1 const unsigned char activemq::commands::WireFormatInfo::ID_WIREFORMATINFO = 1 [static]

The documentation for this class was generated from the following file:

Public Member Functions

- **WireFormatInfoMarshaller** ()
- virtual ~**WireFormatInfoMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.732.1 Detailed Description

Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 3379). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.732.2 Constructor & Destructor Documentation

6.732.2.1 activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::WireFormatInfo () [inline]

6.732.2.2 virtual activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::~WireFormatIn () [inline, virtual]

6.732.3 Member Function Documentation

6.732.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.732.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::getDataStructureT () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.732.3.3 virtual void activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.732.3.4 virtual void activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.732.3.5 virtual int activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.732.3.6 virtual void activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.732.3.7 virtual void activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

6.733.2.1 activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::WireFormatInfo () [inline]

6.733.2.2 virtual activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::~WireFormatIn () [inline, virtual]

6.733.3 Member Function Documentation

6.733.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.733.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::getDataStructureT () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.733.3.3 virtual void activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.733.3.4 virtual void activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.733.3.5 virtual int activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.733.3.6 virtual void activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.733.3.7 virtual void activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.736.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::getDataStructureT () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.736.3.3 virtual void activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.736.3.4 virtual void activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.736.3.5 virtual int activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.736.3.6 virtual void activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.736.3.7 virtual void activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/**WireFormatInfoMarshaller.h**

6.737 activemq::wireformat::WireFormatNegotiator Class Reference

Defines a **WireFormatNegotiator** (p. 3399) which allows a **WireFormat** (p. 3363) to.

`#include <src/main/activemq/wireformat/WireFormatNegotiator.h>`Inheritance diagram for activemq::wireformat::WireFormatNegotiator:

Public Member Functions

- **WireFormatNegotiator** (const **Pointer**< **transport::Transport** > &**next**)
  Constructor.
- virtual ~**WireFormatNegotiator** ()

6.737.1 Detailed Description

Defines a **WireFormatNegotiator** (p. 3399) which allows a **WireFormat** (p. 3363) to.

6.737.2 Constructor & Destructor Documentation

6.737.2.1 activemq::wireformat::WireFormatNegotiator::WireFormatNegotiator (const Pointer< transport::Transport > & *next*) [inline]

Constructor.

Parameters:

next - the next Transport in the chain

6.737.2.2 virtual activemq::wireformat::WireFormatNegotiator::~WireFormatNegotiator () [inline, virtual]

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/**WireFormatNegotiator.h**

6.738 activemq::wireformat::WireFormatRegistry Class Reference

Registry of all **WireFormat** (p. 3363) Factories that are available to the client at runtime.

`#include <src/main/activemq/wireformat/WireFormatRegistry.h>`

Public Member Functions

- virtual ~**WireFormatRegistry** ()
- **WireFormatFactory** * **findFactory** (const std::string &name) const throw (decaf::lang::exceptions::NoSuchElementException)

  *Gets a Registered **WireFormatFactory** (p. 3367) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.*

- void **registerFactory** (const std::string &name, **WireFormatFactory** *factory) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)

  *Registers a new **WireFormatFactory** (p. 3367) with this Registry.*

- void **unregisterFactory** (const std::string &name)

  Unregisters the Factory with the given name and deletes that instance of the Factory.

- std::vector< std::string > **getWireFormatNames** () const

  Retrieves a list of the names of all the Registered WireFormat's in this Registry.

Static Public Member Functions

- static **WireFormatRegistry** & **getInstance** ()

  *Gets the single instance of the **WireFormatRegistry** (p. 3400).*

6.738.1 Detailed Description

Registry of all **WireFormat** (p. 3363) Factories that are available to the client at runtime. New WireFormat's must have a factory registered here before a connection attempt is made.

Since:

3.0

6.738.2 Constructor & Destructor Documentation

6.738.2.1 virtual activemq::wireformat::WireFormatRegistry::~WireFormatRegistry () [virtual]

6.738.3 Member Function Documentation

6.738.3.1 WireFormatFactory* activemq::wireformat::WireFormatRegistry::findFactory (const std::string & *name*) const throw (decaf::lang::exceptions::NoSuchElementException)

Gets a Registered **WireFormatFactory** (p. 3367) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.

Parameters:

name The name of the Factory to find in the Registry.

Returns:

the Factory registered under the given name.

Exceptions:

NoSuchElementException if no factory is registered with that name.

6.738.3.2 static WireFormatRegistry& activemq::wireformat::WireFormatRegistry::getInstance () [static]

Gets the single instance of the **WireFormatRegistry** (p. 3400).

Returns:

reference to the single instance of this Registry

6.738.3.3 std::vector<std::string> activemq::wireformat::WireFormatRegistry::getWireFormatNames () const

Retrieves a list of the names of all the Registered WireFormat's in this Registry.

Returns:

stl vector of strings with all the **WireFormat** (p. 3363) names registered.

6.738.3.4 void activemq::wireformat::WireFormatRegistry::registerFactory (const std::string & *name*, WireFormatFactory * *factory*) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)

Registers a new **WireFormatFactory** (p. 3367) with this Registry. If a Factory with the given name is already registered it is overwritten with the new one. Once a factory is added to the Registry its lifetime is controlled by the Registry, it will be deleted once the Registry has been deleted.

Parameters:

name The name of the new Factory to register.

factory The new Factory to add to the Registry.

Exceptions:

IllegalArgumentException is name is the empty string.

NullPointerException if the Factory is Null.

6.738.3.5 void activemq::wireformat::WireFormatRegistry::unregisterFactory (const std::string & *name*)

Unregisters the Factory with the given name and deletes that instance of the Factory.

Parameters:

name Name of the Factory to unregister and destroy

The documentation for this class was generated from the following file:

6.739 activemq::transport::inactivity::WriteChecker Class Reference

Runnable class used by the {.

`#include <src/main/activemq/transport/inactivity/WriteChecker.h>`Inheritance diagram for activemq::transport::inactivity::WriteChecker:

Public Member Functions

- **WriteChecker** (**InactivityMonitor** *parent)
- virtual ~**WriteChecker** ()
- virtual void **run** ()

  Run method - called by the Thread class in the context of the thread.

6.739.1 Detailed Description

Runnable class used by the {.

See also:

InactivityMonitor (p. 1733)} to make periodic writes to the underlying **transport** (p. 79) if no other write activity is going on in order to more quickly detect failures of the connection to the broker.

Since:

3.1.0

6.739.2 Constructor & Destructor Documentation

6.739.2.1 activemq::transport::inactivity::WriteChecker::WriteChecker (InactivityMonitor * *parent*)

6.739.2.2 virtual activemq::transport::inactivity::WriteChecker::~WriteChecker () [virtual]

6.739.3 Member Function Documentation

6.739.3.1 virtual void activemq::transport::inactivity::WriteChecker::run () [virtual]

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 2816).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/inactivity/**WriteChecker.h**

6.740 decaf::io::Writer Class Reference

`#include <src/main/decaf/io/Writer.h>`

Public Member Functions

- virtual ~**Writer** ()
- virtual void **setOutputStream** (**OutputStream** *os)=0

  Sets the target output stream.

- virtual **OutputStream** * **getOutputStream** ()=0

  Gets the target output stream.

- virtual void **write** (const unsigned char *buffer, std::size_t count)=0 throw (IOException, lang::exceptions::NullPointerException)

  Writes a byte array to the output stream.

- virtual void **writeByte** (unsigned char v)=0 throw (IOException)

  Writes a byte to the output stream.

6.740.1 Constructor & Destructor Documentation

6.740.1.1 virtual decaf::io::Writer::~Writer () [inline, virtual]

6.740.2 Member Function Documentation

6.740.2.1 virtual OutputStream* decaf::io::Writer::getOutputStream () [pure virtual]

Gets the target output stream.

Returns:

the output stream currently being used

6.740.2.2 virtual void decaf::io::Writer::setOutputStream (OutputStream * *os*) [pure virtual]

Sets the target output stream.

Parameters:

os The provided Outputstream to use to write to.

6.740.2.3 virtual void decaf::io::Writer::write (const unsigned char * *buffer*, std::size_t *count*) throw (IOException, lang::exceptions::NullPointerException) [pure virtual]

Writes a byte array to the output stream.

Parameters:

buffer a byte array

count the number of bytes in the array to write.

Exceptions:

IOException *(*p. ***1820)*** thrown if an error occurs.

6.740.2.4 virtual void decaf::io::Writer::writeByte (unsigned char *v*) throw (IOException) [pure virtual]

Writes a byte to the output stream.

Parameters:

v The value to be written.

Exceptions:

IOException *(*p. ***1820)*** thrown if an error occurs.

6.743.1 Member Typedef Documentation

6.743.1.1 typedef decaf::lang::PointerComparator<XATransactionId> activemq::commands::XATransactionId::COMPARATOR

Reimplemented from **activemq::commands::TransactionId** (p. 3217).

6.743.2 Constructor & Destructor Documentation

6.743.2.1 activemq::commands::XATransactionId::XATransactionId ()

6.743.2.2 activemq::commands::XATransactionId::XATransactionId (const XATransactionId & *other*)

6.743.2.3 virtual activemq::commands::XATransactionId::~XATransactionId () [virtual]

6.743.3 Member Function Documentation

6.743.3.1 virtual XATransactionId* activemq::commands::XATransactionId::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::TransactionId** (p. 3218).

6.743.3.2 virtual int activemq::commands::XATransactionId::compareTo (const XATransactionId & *value*) const [virtual]

6.743.3.3 virtual void activemq::commands::XATransactionId::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::TransactionId** (p. 3218).

6.743.3.4 virtual bool activemq::commands::XATransactionId::equals (const XATransactionId & *value*) const [virtual]

6.743.3.5 virtual bool activemq::commands::XATransactionId::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::TransactionId** (p. 3218).

6.743.3.6 virtual std::vector<unsigned char>& activemq::commands::XATransactionId::getBranchQualifier () [virtual]

6.743.3.7 virtual const std::vector<unsigned char>& activemq::commands::XATransactionId::getBranchQualifier () const [virtual]

6.743.3.8 virtual unsigned char activemq::commands::XATransactionId::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Reimplemented from **activemq::commands::TransactionId** (p. 3219).

6.743.3.9 virtual int activemq::commands::XATransactionId::getFormatId () const [virtual]

6.743.3.10 virtual std::vector<unsigned char>& activemq::commands::XATransactionId::getGlobalTransactionId () [virtual]

6.743.3.11 virtual const std::vector<unsigned char>& activemq::commands::XATransactionId::getGlobalTransactionId () const [virtual]

6.743.3.12 virtual bool activemq::commands::XATransactionId::operator< (const XATransactionId & *value*) const [virtual]

6.743.3.13 XATransactionId& activemq::commands::XATransactionId::operator= (const XATransactionId & *other*)

6.743.3.14 virtual bool activemq::commands::XATransactionId::operator== (const XATransactionId & *value*) const [virtual]

6.743.3.15 virtual void activemq::commands::XATransactionId::setBranchQualifier (const std::vector< unsigned char > & *branchQualifier*) [virtual]

6.743.3.16 virtual void activemq::commands::XATransactionId::setFormatId (int *formatId*) [virtual]

6.743.3.17 virtual void activemq::commands::XATransactionId::setGlobalTransactionId (const std::vector< unsigned char > & *globalTransactionId*) [virtual]

6.743.3.18 virtual std::string activemq::commands::XATransactionId::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::TransactionId** (p. 3219).

6.743.4 Field Documentation

Marshaling code for Open Wire Format for **XATransactionIdMarshaller** (p. 3415).

`#include <src/main/activemq/wireformat/openwire/marshal/v2/XATransactionIdMarshaller.h>`Inheritanc diagram for activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller:

Public Member Functions

- **XATransactionIdMarshaller** ()
- virtual ~**XATransactionIdMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.744.1 Detailed Description

Marshaling code for Open Wire Format for **XATransactionIdMarshaller** (p. 3415). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.744.2 Constructor & Destructor Documentation

6.744.2.1 activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::XATransaction() [inline]

6.744.2.2 virtual activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::~XATransactio() [inline, virtual]

6.744.3 Member Function Documentation

6.744.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.744.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::getDataStructure() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.744.3.3 virtual void activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 3221).

6.744.3.4 virtual void activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 3221).

6.744.3.5 virtual int activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 3222).

6.744.3.6 virtual void activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 3222).

6.744.3.7 virtual void activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 3223).

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.748.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::getDataStructure() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.748.3.3 virtual void activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller** (p. 3233).

6.748.3.4 virtual void activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller** (p. 3233).

6.748.3.5 virtual int activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller** (p. 3234).

6.748.3.6 virtual void activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller** (p. 3234).

6.748.3.7 virtual void activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller** (p. 3235).

The documentation for this class was generated from the following file:

Chapter 7

File Documentation

7.1 src/main/activemq/cmsutil/CachedConsumer.h File Reference

```
#include <cms/MessageConsumer.h>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::CachedConsumer**

  A cached message consumer contained within a pooled session.

Namespaces

- namespace **activemq**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::cmsutil**

7.2 src/main/activemq/cmsutil/CachedProducer.h File Reference

`#include <cms/MessageProducer.h>`

`#include <activemq/util/Config.h>`

Data Structures

- class **activemq::cmsutil::CachedProducer**

  A cached message producer contained within a pooled session.

Namespaces

- namespace **activemq**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::cmsutil**

7.3 src/main/activemq/cmsutil/CmsAccessor.h File Reference

```
#include <cms/ConnectionFactory.h>
#include <activemq/cmsutil/ResourceLifecycleManager.h>
#include <activemq/util/Config.h>
#include <decaf/lang/exceptions/IllegalStateException.h>
```

Data Structures

- class **activemq::cmsutil::CmsAccessor**

  *Base class for **activemq.cmsutil.CmsTemplate** (p. 1041) and other CMS-accessing gateway helpers, defining common properties such as the CMS **cms.ConnectionFactory** (p. 1184) to operate on.*

Namespaces

- namespace **activemq**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::cmsutil**

7.4 src/main/activemq/cmsutil/CmsDestinationAccessor.h File Reference

```
#include <activemq/util/Config.h>
#include <activemq/cmsutil/CmsAccessor.h>
#include <activemq/cmsutil/DynamicDestinationResolver.h>
```

Data Structures

- class **activemq::cmsutil::CmsDestinationAccessor**

  Extends the `CmsAccessor` (p. 1024) to add support for resolving destination names.

Namespaces

- namespace **activemq**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::cmsutil**

7.5 src/main/activemq/cmsutil/CmsTemplate.h File Reference

```
#include <activemq/util/Config.h>
#include <activemq/cmsutil/CmsDestinationAccessor.h>
#include <activemq/cmsutil/SessionCallback.h>
#include <activemq/cmsutil/ProducerCallback.h>
#include <activemq/cmsutil/SessionPool.h>
#include <decaf/lang/exceptions/IllegalStateException.h>
#include <cms/ConnectionFactory.h>
#include <cms/DeliveryMode.h>
#include <string>
```

Data Structures

- class **activemq::cmsutil::CmsTemplate**

  CmsTemplate (p. 1041) simplifies performing synchronous CMS operations.

- class **activemq::cmsutil::CmsTemplate::ProducerExecutor**
- class **activemq::cmsutil::CmsTemplate::ResolveProducerExecutor**
- class **activemq::cmsutil::CmsTemplate::SendExecutor**
- class **activemq::cmsutil::CmsTemplate::ReceiveExecutor**
- class **activemq::cmsutil::CmsTemplate::ResolveReceiveExecutor**

Namespaces

- namespace **activemq**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::cmsutil**

7.6 src/main/activemq/cmsutil/DestinationResolver.h File Reference

`#include <cms/Session.h>`

`#include <activemq/util/Config.h>`

Data Structures

- class **activemq::cmsutil::DestinationResolver**

  Resolves a CMS destination name to a `Destination`.

Namespaces

- namespace **activemq**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::cmsutil**

7.7 src/main/activemq/cmsutil/DynamicDestinationResolver.h File Reference

```
#include <activemq/cmsutil/DestinationResolver.h>
#include <cms/Session.h>
#include <decaf/util/StlMap.h>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::DynamicDestinationResolver**

  Resolves a CMS destination name to a `Destination`.

- class **activemq::cmsutil::DynamicDestinationResolver::SessionResolver**

  Manages maps of names to topics and queues for a single session.

Namespaces

- namespace **activemq**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::cmsutil**

7.8 src/main/activemq/cmsutil/MessageCreator.h File Reference

```
#include <cms/Session.h>
#include <cms/Message.h>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::MessageCreator**

  Creates the user-defined message to be sent by the `CmsTemplate` *(p. 1041).*

Namespaces

- namespace **activemq**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::cmsutil**

7.9 src/main/activemq/cmsutil/PooledSession.h File Reference

```
#include <cms/Session.h>
#include <decaf/util/StlMap.h>
#include <activemq/cmsutil/CachedProducer.h>
#include <activemq/cmsutil/CachedConsumer.h>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::PooledSession**

  A pooled session object that wraps around a delegate session.

Namespaces

- namespace **activemq**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::cmsutil**

7.10 src/main/activemq/cmsutil/ProducerCallback.h File Reference

```
#include <cms/Session.h>
#include <cms/MessageProducer.h>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::ProducerCallback**

  Callback for sending a message to a CMS destination.

Namespaces

- namespace **activemq**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::cmsutil**

7.11 src/main/activemq/cmsutil/ResourceLifecycleManager.h File Reference

```
#include <cms/Connection.h>
#include <cms/Session.h>
#include <cms/Destination.h>
#include <cms/MessageProducer.h>
#include <cms/MessageConsumer.h>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::ResourceLifecycleManager**

  Manages the lifecycle of a set of CMS resources.

Namespaces

- namespace **activemq**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::cmsutil**

7.12 src/main/activemq/cmsutil/SessionCallback.h File Reference

```
#include <cms/Session.h>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::SessionCallback**

  Callback for executing any number of operations on a provided CMS Session.

Namespaces

- namespace **activemq**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::cmsutil**

7.13 src/main/activemq/cmsutil/SessionPool.h File Reference

```
#include <activemq/cmsutil/PooledSession.h>
#include <decaf/util/concurrent/Mutex.h>
#include <cms/Connection.h>
#include <list>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::SessionPool**

  A pool of CMS sessions from the same connection and with the same acknowledge mode.

Namespaces

- namespace **activemq**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::cmsutil**

7.14 src/main/activemq/commands/ActiveMQBlobMessage.h File Reference

```

Defines

- #define **AMQ_CATCH_RETHROW**(type)

  Macro for catching and re-throwing an exception of a given type.

- #define **AMQ_CATCH_EXCEPTION_CONVERT**(sourceType, targetType)

  Macro for catching an exception of one type and then re-throwing as another type.

- #define **AMQ_CATCHALL_THROW**(type)

  A catch-all that throws a known exception.

- #define **AMQ_CATCHALL_NOTHROW**()

  A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.

- #define **AMQ_CATCH_NOTHROW**(type)

  Macro for catching and re-throwing an exception of a given type.

7.99.1 Define Documentation

7.99.1.1 #define AMQ_CATCH_EXCEPTION_CONVERT(sourceType, targetType)

Value:

```
catch( sourceType& ex ){ \
        targetType target( ex ); \
        target.setMark( __FILE__, __LINE__ ); \
        throw target; \
    }
```

Macro for catching an exception of one type and then re-throwing as another type.

Parameters:

sourceType the type of the exception to be caught.

targetType the type of the exception to be thrown.

Referenced by activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray(), activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1(), and activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2().

7.99.1.2 #define AMQ_CATCH_NOTHROW(type)

Value:

```
catch( type& ex ){ \
        ex.setMark( __FILE__, __LINE__ ); \
    }
```

Macro for catching and re-throwing an exception of a given type.

Parameters:

type The type of the exception to throw (e.g. ActiveMQException).

7.99.1.3 #define AMQ_CATCH_RETHROW(type)

Value:

```
catch( type& ex ){ \
        ex.setMark( __FILE__, __LINE__ ); \
        throw ex; \
    }
```

Macro for catching and re-throwing an exception of a given type.

Parameters:

type The type of the exception to throw (e.g. ActiveMQException).

Referenced by activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray(), activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1(), and activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2().

7.99.1.4 #define AMQ_CATCHALL_NOTHROW()

Value:

```
catch( ... ){ \
        activemq::exceptions::ActiveMQException ex( __FILE__, __LINE__, \
            "caught unknown exception, not rethrowing" ); \
    }
```

A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.

7.99.1.5 #define AMQ_CATCHALL_THROW(type)

Value:

```
catch( ... ){ \
        type ex( __FILE__, __LINE__, \
            "caught unknown exception" ); \
        throw ex; \
    }
```

A catch-all that throws a known exception.

Parameters:

type the type of exception to be thrown.

Referenced by activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray(), activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1(), and activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2().

7.100 src/main/decaf/lang/exceptions/ExceptionDefines.h File Reference

Defines

- #define **DECAF_CATCH_RETHROW**(type)
  Macro for catching and rethrowing an exception of a given type.
- #define **DECAF_CATCH_EXCEPTION_CONVERT**(sourceType, targetType)
  Macro for catching an exception of one type and then rethrowing as another type.
- #define **DECAF_CATCHALL_THROW**(type)
  A catch-all that throws a known exception.
- #define **DECAF_CATCHALL_NOTHROW**()
  A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.
- #define **DECAF_CATCH_NOTHROW**(type)
  Macro for catching and rethrowing an exception of a given type.

7.100.1 Define Documentation

7.100.1.1 #define DECAF_CATCH_EXCEPTION_CONVERT(sourceType, targetType)

Value:

```
catch( sourceType& ex ){ \
        targetType target( &ex ); \
        target.setMark( __FILE__, __LINE__ ); \
        throw target; \
    }
```

Macro for catching an exception of one type and then rethrowing as another type.

Parameters:

sourceType the type of the exception to be caught.

targetType the type of the exception to be thrown.

Referenced by decaf::util::PriorityQueue< E >::add().

7.100.1.2 #define DECAF_CATCH_NOTHROW(type)

Value:

```
catch( type& ex ){ \
        ex.setMark( __FILE__, __LINE__ ); \
    }
```

Macro for catching and rethrowing an exception of a given type.

Parameters:

type The type of the exception to throw (e.g. Exception).

Referenced by decaf::io::FilterInputStream::~FilterInputStream(), decaf::io::FilterOutputStream::~FilterOutputStream(), and decaf::util::logging::StreamHandler::~StreamHandler().

7.100.1.3 #define DECAF_CATCH_RETHROW(type)

Value:

```
catch( type& ex ){ \
        ex.setMark( __FILE__, __LINE__ ); \
        throw ex; \
    }
```

Macro for catching and rethrowing an exception of a given type.

Parameters:

type The type of the exception to throw (e.g. Exception).

Referenced by decaf::util::PriorityQueue< E >::add(), decaf::io::FilterInputStream::available(), decaf::io::FilterOutputStream::close(), decaf::io::FilterInputStream::close(), decaf::io::FilterOutputStream::flush(), decaf::util::concurrent::Lock::lock(), decaf::util::concurrent::Lock::Lock(), decaf::util::logging::StreamHandler::publish(), decaf::io::FilterInputStream::read(), decaf::io::FilterInputStream::reset(), decaf::io::FilterInputStream::skip(), decaf::util::concurrent::Lock::unlock(), decaf::io::FilterOutputStream::write(), and decaf::util::concurrent::Lock::~Lock().

7.100.1.4 #define DECAF_CATCHALL_NOTHROW()

Value:

```
catch( ... ){ \
        lang::Exception ex( __FILE__, __LINE__, \
            "caught unknown exception, not rethrowing" ); \
    }
```

A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.

Referenced by decaf::io::FilterInputStream::mark(), decaf::io::FilterInputStream::markSupported(), decaf::io::FilterInputStream::~FilterInputStream(), decaf::io::FilterOutputStream::~FilterOutputStream(), and decaf::util::logging::StreamHandler::~StreamHandler().

7.100.1.5 #define DECAF_CATCHALL_THROW(type)

Value:

```
catch( ... ){ \
        type ex( __FILE__, __LINE__, \
            "caught unknown exception" ); \
        throw ex; \
    }
```

A catch-all that throws a known exception.

Parameters:

type the type of exception to be thrown.

Referenced by decaf::util::PriorityQueue< E >::add(), decaf::io::FilterInputStream::available(), decaf::io::FilterOutputStream::close(), decaf::io::FilterInputStream::close(), decaf::io::FilterOutputStream::flush(), decaf::util::concurrent::Lock::lock(), decaf::util::concurrent::Lock::Lock(), decaf::util::logging::StreamHandler::publish(), decaf::io::FilterInputStream::read(), decaf::io::FilterInputStream::reset(), decaf::io::FilterInputStream::skip(), decaf::util::concurrent::Lock::unlock(), decaf::io::FilterOutputStream::write(), and decaf::util::concurrent::Lock::~Lock().

7.494 src/main/cms/CMSException.h File Reference

```
#include <string>
#include <vector>
#include <iostream>
#include <exception>
#include <cms/Config.h>
```

Data Structures

- class **cms::CMSException**

  CMS API Exception that is the base for all exceptions thrown from CMS classes.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.495 src/main/cms/CMSProperties.h File Reference

```
#include <cms/Config.h>
#include <map>
#include <string>
#include <vector>
```

Data Structures

- class **cms::CMSProperties**

  Interface for a Java-like properties object.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.496 src/main/cms/CMSSecurityException.h File Reference

```
#include <cms/Config.h>
```

```
#include <cms/CMSException.h>
```

Data Structures

- class **cms::CMSSecurityException**

  This exception must be thrown when a provider rejects a user name/password submitted by a client.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.497 src/main/cms/Connection.h File Reference

#include <cms/Config.h>
#include <cms/Startable.h>
#include <cms/Stoppable.h>
#include <cms/Closeable.h>
#include <cms/Session.h>
#include <cms/ConnectionMetaData.h>
```

Data Structures

- class **cms::Connection**

  The client's connection to its provider.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.498 src/main/cms/ConnectionFactory.h File Reference

```
#include <cms/Config.h>
#include <cms/Connection.h>
#include <cms/CMSException.h>
#include <string>
```

Data Structures

- class **cms::ConnectionFactory**

  Defines the interface for a factory that creates connection objects, the ***Connection*** *(p. 1131) objects returned implement the CMS* ***Connection*** *(p. 1131) interface and hide the CMS Provider specific implementation details behind that interface.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.499 src/main/cms/ConnectionMetaData.h File Reference

```
#include <cms/Config.h>
```

```
#include <cms/CMSException.h>
```

Data Structures

- class **cms::ConnectionMetaData**

  *A **ConnectionMetaData** (p. 1237) object provides information describing the **Connection** (p. 1131) object.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.500 src/main/cms/DeliveryMode.h File Reference

`#include <cms/Config.h>`

Data Structures

- class **cms::DeliveryMode**

  This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.501 src/main/cms/Destination.h File Reference

```
#include <cms/CMSProperties.h>
#include <cms/Config.h>
#include <string>
```

Data Structures

- class **cms::Destination**

  *A **Destination** (p. 1480) object encapsulates a provider-specific address.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.502 src/main/cms/ExceptionListener.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::ExceptionListener**

  If a CMS provider detects a serious problem, it notifies the client application through an ***ExceptionListener*** *(p. 1581) that is registered with the* ***Connection*** *(p. 1131).*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.503 src/main/cms/IllegalStateException.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::IllegalStateException**

  This exception is thrown when a method is invoked at an illegal or inappropriate time or if the provider is not in an appropriate state for the requested operation.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.504 src/main/decaf/lang/exceptions/IllegalStateException.h File Reference

```
#include <decaf/lang/Exception.h>
```

Data Structures

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::lang**
- namespace **decaf::lang::exceptions**

7.505 src/main/cms/InvalidClientIdException.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::InvalidClientIdException**

  This exception must be thrown when a client attempts to set a connection's client ID to a value that is rejected by a provider.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.506 src/main/cms/InvalidDestinationException.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::InvalidDestinationException**

  This exception must be thrown when a destination either is not understood by a provider or is no longer valid.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.507 src/main/cms/InvalidSelectorException.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::InvalidSelectorException**

  This exception must be thrown when a CMS client attempts to give a provider a message selector with invalid syntax.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.508 src/main/cms/MapMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
#include <cms/MessageFormatException.h>
#include <cms/MessageNotWriteableException.h>
```

Data Structures

- class **cms::MapMessage**

  *A **MapMessage** (p. 2106) object is used to send a set of name-value pairs.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.509 src/main/cms/MessageConsumer.h File Reference

```
#include <cms/Config.h>
#include <cms/MessageListener.h>
#include <cms/Message.h>
#include <cms/Closeable.h>
```

Data Structures

- class **cms::MessageConsumer**

  A client uses a `MessageConsumer` (p. 2214) *to received messages from a destination.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.510 src/main/cms/MessageEOFException.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::MessageEOFException**

  This exception must be thrown when an unexpected end of stream has been reached when a ***StreamMessage*** *(p. 3081) or* ***BytesMessage*** *(p. 938) is being read.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.511 src/main/cms/MessageFormatException.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::MessageFormatException**

  This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.512 src/main/cms/MessageListener.h File Reference

`#include <cms/Config.h>`

Data Structures

- class **cms::MessageListener**

  A `MessageListener` (p. 2304) object is used to receive asynchronously delivered messages.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.513 src/main/cms/MessageNotReadableException.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::MessageNotReadableException**

  This exception must be thrown when a CMS client attempts to read a write-only message.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.514 src/main/cms/MessageNotWriteableException.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::MessageNotWriteableException**

  This exception must be thrown when a CMS client attempts to write to a read-only message.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.515 src/main/cms/MessageProducer.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/Destination.h>
#include <cms/Closeable.h>
#include <cms/CMSException.h>
#include <cms/InvalidDestinationException.h>
#include <cms/MessageFormatException.h>
#include <cms/UnsupportedOperationException.h>
#include <cms/DeliveryMode.h>
```

Data Structures

- class **cms::MessageProducer**

  A client uses a ***MessageProducer*** (p. 2332) *object to send messages to a* ***Destination*** (p. 1480)*.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.516 src/main/cms/ObjectMessage.h File Reference

```
#include <cms/Config.h>
```

```
#include <cms/Message.h>
```

Data Structures

- class **cms::ObjectMessage**

  Place holder for interaction with JMS systems that support Java, the C++ client is not responsible for deserializing the contained Object.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.517 src/main/cms/Queue.h File Reference

```
#include <cms/Config.h>
#include <cms/Destination.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Queue**

  An interface encapsulating a provider-specific queue name.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.518 src/main/decaf/util/Queue.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/util/Iterator.h>
#include <decaf/util/AbstractCollection.h>
#include <decaf/lang/Exception.h>
#include <decaf/lang/exceptions/NoSuchElementException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
```

Data Structures

- class **decaf::util::Queue< E >**

  A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::util**

7.519 src/main/cms/QueueBrowser.h File Reference

```
#include <vector>
#include <string>
#include <cms/Config.h>
#include <cms/Closeable.h>
#include <cms/Queue.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::QueueBrowser**

  This class implements in interface for browsing the messages in a ***Queue*** *(p. 2674) without removing them.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.520 src/main/cms/Session.h File Reference

```
#include <cms/Config.h>
#include <cms/Closeable.h>
#include <cms/Message.h>
#include <cms/TextMessage.h>
#include <cms/BytesMessage.h>
#include <cms/MapMessage.h>
#include <cms/StreamMessage.h>
#include <cms/MessageProducer.h>

#include <cms/Queue.h>
#include <cms/QueueBrowser.h>
#include <cms/TemporaryTopic.h>
#include <cms/TemporaryQueue.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Session**

  *A **Session** (p. 2839) object is a single-threaded context for producing and consuming messages.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.521 src/main/cms/Startable.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::Startable**

  Interface for a class that implements the start method.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.522 src/main/cms/Stoppable.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::Stoppable**

  Interface for a class that implements the stop method.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.523 src/main/cms/StreamMessage.h File Reference

```

#include <cms/MessageNotReadableException.h>
#include <cms/MessageNotWriteableException.h>
#include <cms/MessageFormatException.h>
#include <cms/MessageEOFException.h>
```

Data Structures

- class **cms::StreamMessage**

  Interface for a ***StreamMessage*** *(p. 3081).*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.524 src/main/cms/TemporaryQueue.h File Reference

```
#include <cms/Config.h>
#include <cms/Destination.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::TemporaryQueue**

  *Defines a Temporary **Queue** (p. 2674) based **Destination** (p. 1480).*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.525 src/main/cms/TemporaryTopic.h File Reference

```
#include <cms/Config.h>
#include <cms/Destination.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::TemporaryTopic**

  Defines a Temporary ***Topic*** *(p. 3215) based* ***Destination*** *(p. 1480).*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.526 src/main/cms/TextMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
#include <cms/MessageNotWriteableException.h>
```

Data Structures

- class **cms::TextMessage**

  Interface for a text message.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.527 src/main/cms/Topic.h File Reference

```
#include <cms/Config.h>
#include <cms/Destination.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Topic**

  An interface encapsulating a provider-specific topic name.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.528 src/main/cms/UnsupportedOperationException.h File Reference

`#include <cms/Config.h>`

`#include <cms/CMSException.h>`

Data Structures

- class **cms::UnsupportedOperationException**

  This exception must be thrown when a CMS client attempts use a CMS method that is not implemented or not supported by the CMS Provider in use.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.529 src/main/decaf/lang/exceptions/UnsupportedOperationException.h File Reference

```
#include <decaf/lang/Exception.h>
```

Data Structures

7.530 src/main/decaf/internal/AprPool.h File Reference

```
#include <decaf/util/Config.h>
```

```
#include <apr_pools.h>
```

Data Structures

- class **decaf::internal::AprPool**

  Wraps an APR pool object so that classes in decaf can create a static member for use in static methods where apr function calls that need a pool are made.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::internal**

7.531 src/main/decaf/internal/DecafRuntime.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/lang/Runtime.h>
#include <memory>
#include <apr_pools.h>
```

Data Structures

- class **decaf::internal::DecafRuntime**

  Handles APR initialization and termination.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::internal**

7.532 src/main/decaf/internal/io/StandardErrorOutputStream.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/OutputStream.h>
#include <decaf/util/concurrent/Mutex.h>
```

Data Structures

- class **decaf::internal::io::StandardErrorOutputStream**

  Wrapper Around the Standard error Output facility on the current platform.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::internal**
- namespace **decaf::internal::io**

```
#include <decaf/io/FilterInputStream.h>
```

```
#include <decaf/lang/exceptions/IllegalArgumentException.h>
```

Data Structures

- class **decaf::io::BufferedInputStream**

  A wrapper around another input stream that performs a buffered read, where it reads more data than it needs in order to reduce the number of io operations on the input stream.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.562 src/main/decaf/io/BufferedOutputStream.h File Reference

```
#include <decaf/io/FilterOutputStream.h>
```

```
#include <decaf/lang/exceptions/IllegalArgumentException.h>
```

Data Structures

- class **decaf::io::BufferedOutputStream**

  Wrapper around another output stream that buffers output before writing to the target output stream.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.563 src/main/decaf/io/ByteArrayInputStream.h File Reference

```
#include <decaf/io/InputStream.h>
#include <decaf/util/concurrent/Mutex.h>
#include <vector>
#include <algorithm>
```

Data Structures

- class **decaf::io::ByteArrayInputStream**

  *Simple implementation of **InputStream** (p. 1740) that wraps around an STL Vector std::vector<unsigned char>.*

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.564 src/main/decaf/io/ByteArrayOutputStream.h File Reference

```
#include <decaf/io/OutputStream.h>
#include <decaf/util/concurrent/Mutex.h>
#include <vector>
```

Data Structures

- class **decaf::io::ByteArrayOutputStream**

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.565 src/main/decaf/io/DataInputStream.h File Reference

```
#include <decaf/io/FilterInputStream.h>
#include <decaf/io/IOException.h>
#include <decaf/io/EOFException.h>
#include <decaf/io/UTFDataFormatException.h>
#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
```

Data Structures

- class **decaf::io::DataInputStream**

  A data input stream lets an application read primitive Java data types from an underlying input stream in a machine-independent way.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.566 src/main/decaf/io/DataOutputStream.h File Reference

```
#include <decaf/io/FilterOutputStream.h>
#include <decaf/io/IOException.h>
#include <decaf/io/UTFDataFormatException.h>
#include <string>
```

Data Structures

- class **decaf::io::DataOutputStream**

  A data output stream lets an application write primitive Java data types to an output stream in a portable way.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.567 src/main/decaf/io/EOFException.h File Reference

```
#include <decaf/io/IOException.h>
```

Data Structures

- class **decaf::io::EOFException**

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.568 src/main/decaf/io/FilterInputStream.h File Reference

```
#include <decaf/io/InputStream.h>
#include <decaf/io/IOException.h>
#include <decaf/util/concurrent/Mutex.h>
#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
```

Data Structures

- class **decaf::io::FilterInputStream**

  *A **FilterInputStream** (p. 1631) contains some other input stream, which it uses as its basic source of data, possibly transforming the data along the way or providing additional functionality.*

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.569 src/main/decaf/io/FilterOutputStream.h File Reference

```
#include <decaf/io/OutputStream.h>
#include <decaf/io/IOException.h>
#include <decaf/util/concurrent/Mutex.h>
#include <decaf/lang/exceptions/NullPointerException.h>
```

Data Structures

- class **decaf::io::FilterOutputStream**

  This class is the superclass of all classes that filter output streams.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.570 src/main/decaf/io/InputStream.h File Reference

```
#include <decaf/io/IOException.h>
#include <decaf/io/Closeable.h>
#include <decaf/util/concurrent/Synchronizable.h>
#include <decaf/lang/exceptions/UnsupportedOperationException.h>
#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/util/Config.h>
```

Data Structures

- class **decaf::io::InputStream**

  Base interface for an input stream.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::io**

7.571 src/main/decaf/io/InterruptedIOException.h File Reference

Defines

- #define **WAIT_INFINITE** 0xFFFFFFFF

  The synchronized macro defines a mechanism for synchronizing a section of code.

- #define **synchronized**(W)

7.685.1 Define Documentation

7.685.1.1 #define synchronized(W)

Value:

```
if(false){}                                                    \
        else                                                          \
        for( decaf::util::concurrent::Lock lock_W(W);                 \
             lock_W.isLocked(); lock_W.unlock() )
```

7.685.1.2 #define WAIT_INFINITE 0xFFFFFFFF

The synchronized macro defines a mechanism for synchronizing a section of code. The macro must be passed an object that implements the Synchronizable interface.

The macro works by creating a for loop that will loop exactly once, creating a Lock object that is scoped to the loop. Once the loop completes and exits the Lock object goes out of scope releasing the lock on object W. For added safety the if else is used because not all compiles restrict the lifetime of loop variables to the loop, they will however restrict them to the scope of the else.

The macro would be used as follows.

Synchronizable X;

somefunction() { **synchronized(X)** (p. 4126) { // Do something that needs synchronizing. } }

7.686 src/main/decaf/util/concurrent/ConcurrentMap.h File Reference
