6.230 activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshal Class Reference

Marshaling code for Open Wire Format for **ConsumerIdMarshaller** (p. 1280).

`#include <src/main/activemq/wireformat/openwire/marshal/v3/ConsumerIdMarshaller.h>`Inheritance diagram for activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller:

Public Member Functions

- **ConsumerIdMarshaller** ()
- virtual ~**ConsumerIdMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.230.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerIdMarshaller** (p. 1280). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.230.2 Constructor & Destructor Documentation

6.230.2.1 activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::ConsumerIdMarshal () [inline]

6.230.2.2 virtual activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::~ConsumerIdMarsh () [inline, virtual]

6.230.3 Member Function Documentation

6.230.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.230.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.230.3.3 virtual void activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.230.3.4 virtual void activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.230.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.230.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.230.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

The documentation for this class was generated from the following file:

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.231.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerIdMarshaller** (p. 1284). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.231.2 Constructor & Destructor Documentation

6.231.2.1 activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::ConsumerIdMarsha () [inline]

6.231.2.2 virtual activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::~ConsumerIdMarsh () [inline, virtual]

6.231.3 Member Function Documentation

6.231.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.231.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.231.3.3 virtual void activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.231.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.231.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.231.3.6 virtual void activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.231.3.7 virtual void activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.233.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::ConsumerIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.233.3.3 virtual void activemq::wireformat::openwire::marshal::v5::ConsumerIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.233.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ConsumerIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.233.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ConsumerIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.233.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ConsumerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.233.3.7 virtual void activemq::wireformat::openwire::marshal::v5::ConsumerIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

6.234.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.234.3.3 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.234.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.234.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.234.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.234.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

6.235.1 Constructor & Destructor Documentation

6.235.1.1 activemq::commands::ConsumerInfo::ConsumerInfo (const ConsumerInfo &) [inline, protected]

6.235.1.2 activemq::commands::ConsumerInfo::ConsumerInfo ()

6.235.1.3 virtual activemq::commands::ConsumerInfo::~ConsumerInfo () [virtual]

6.235.2 Member Function Documentation

6.235.2.1 virtual ConsumerInfo* activemq::commands::ConsumerInfo::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.235.2.2 virtual void activemq::commands::ConsumerInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.235.2.3 virtual bool activemq::commands::ConsumerInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.235.2.4 virtual Pointer<BooleanExpression>& activemq::commands::ConsumerInfo::getAdditionalPredicate () [virtual]

6.235.2.5 virtual const Pointer<BooleanExpression>& activemq::commands::ConsumerInfo::getAdditionalPredicate () const [virtual]

6.235.2.6 virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ConsumerInfo::getBrokerPath () [virtual]

6.235.2.7 virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ConsumerInfo::getBrokerPath () const [virtual]

6.235.2.8 virtual Pointer<ConsumerId>& activemq::commands::ConsumerInfo::getConsumerId () [virtual]

6.235.2.9 virtual const Pointer<ConsumerId>& activemq::commands::ConsumerInfo::getConsumerId () const [virtual]

6.235.2.10 virtual unsigned char activemq::commands::ConsumerInfo::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.235.2.11 virtual Pointer<ActiveMQDestination>& activemq::commands::ConsumerInfo::getDestination () [virtual]

6.235.2.12 virtual const Pointer<ActiveMQDestination>& activemq::commands::ConsumerInfo::getDestination () const [virtual]

6.235.2.13 virtual int activemq::commands::ConsumerInfo::getMaximumPendingMessageLimit () const [virtual]

6.235.2.14 virtual std::vector< decaf::lang::Pointer<ConsumerId> >& activemq::commands::ConsumerInfo::getNetworkConsumerPath () [virtual]

6.235.2.15 virtual const std::vector< decaf::lang::Pointer<ConsumerId> >& activemq::commands::ConsumerInfo::getNetworkConsumerPath () const [virtual]

6.235.2.16 virtual int activemq::commands::ConsumerInfo::getPrefetchSize () const [virtual]

6.235.2.17 virtual unsigned char activemq::commands::ConsumerInfo::getPriority () const [virtual]

6.235.2.18 virtual std::string& activemq::commands::ConsumerInfo::getSelector () [virtual]

6.235.2.19 virtual const std::string& activemq::commands::ConsumerInfo::getSelector () const [virtual]

6.235.2.20 virtual std::string& activemq::commands::ConsumerInfo::getSubscriptionName () [virtual]

6.235.2.21 virtual const std::string& activemq::commands::ConsumerInfo::getSubscriptionName () const [virtual]

6.235.2.22 virtual bool activemq::commands::ConsumerInfo::isBrowser () const [virtual]

6.235.2.23 virtual bool activemq::commands::ConsumerInfo::isConsumerInfo () const [inline, virtual]

Returns:

an answer of true to the **isConsumerInfo()** (p. 1304) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 653).

6.235.2.24 virtual bool activemq::commands::ConsumerInfo::isDispatchAsync () const [virtual]

6.235.2.25 virtual bool activemq::commands::ConsumerInfo::isExclusive () const [virtual]

6.235.2.26 virtual bool activemq::commands::ConsumerInfo::isNetworkSubscription () const [virtual]

6.235.2.27 virtual bool activemq::commands::ConsumerInfo::isNoLocal () const [virtual]

6.235.2.28 virtual bool activemq::commands::ConsumerInfo::isNoRangeAcks () const [virtual]

6.235.2.29 virtual bool activemq::commands::ConsumerInfo::isOptimizedAcknowledge () const [virtual]

6.235.2.30 virtual bool activemq::commands::ConsumerInfo::isRetroactive () const [virtual]

6.235.2.31 ConsumerInfo& activemq::commands::ConsumerInfo::operator= (const ConsumerInfo &) [inline, protected]

6.235.2.32 virtual void activemq::commands::ConsumerInfo::setAdditionalPredicate (const Pointer< BooleanExpression > & *additionalPredicate*) [virtual]

6.235.2.33 virtual void activemq::commands::ConsumerInfo::setBrokerPath (const std::vector< decaf::lang::Pointer< BrokerId > > & *brokerPath*) [virtual]

6.235.2.34 virtual void activemq::commands::ConsumerInfo::setBrowser (bool *browser*) [virtual]

6.235.2.35 virtual void activemq::commands::ConsumerInfo::setConsumerId (const Pointer< ConsumerId > & *consumerId*) [virtual]

6.235.2.36 virtual void activemq::commands::ConsumerInfo::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.235.2.37 virtual void activemq::commands::ConsumerInfo::setDispatchAsync (bool *dispatchAsync*) [virtual]

6.235.2.38 virtual void activemq::commands::ConsumerInfo::setExclusive (bool *exclusive*) [virtual]

6.235.2.39 virtual void activemq::commands::ConsumerInfo::setMaximumPendingMessageLimit (int *maximumPendingMessageLimit*) [virtual]

6.235.2.40 virtual void activemq::commands::ConsumerInfo::setNetworkConsumerPath (const std::vector< decaf::lang::Pointer< ConsumerId > > & *networkConsumerPath*) [virtual]

6.235.2.41 virtual void activemq::commands::ConsumerInfo::setNetworkSubscription (bool *networkSubscription*) [virtual]

6.235.2.42 virtual void activemq::commands::ConsumerInfo::setNoLocal (bool *noLocal*) [virtual]

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 655).

6.235.2.51 virtual Pointer<Command> activemq::commands::ConsumerInfo::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1067).

6.235.3 Field Documentation

  Write a object instance to data output stream.

6.236.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerInfoMarshaller** (p. 1309). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.236.2 Constructor & Destructor Documentation

6.236.2.1 activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::ConsumerInfoMar () [inline]

6.236.2.2 virtual activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::~ConsumerInfoMa () [inline, virtual]

6.236.3 Member Function Documentation

6.236.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.236.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::getDataStructureTy () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.236.3.3 virtual void activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 658).

6.236.3.4 virtual void activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 659).

6.236.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 660).

6.236.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 661).

6.236.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 662).

6.237.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.237.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::getDataStructureTy () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.237.3.3 virtual void activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 665).

6.237.3.4 virtual void activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 666).

6.237.3.5 virtual int activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 667).

6.237.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 668).

6.237.3.7 virtual void activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 669).

The documentation for this class was generated from the following file:

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.238.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerInfoMarshaller** (p. 1317). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.238.2 Constructor & Destructor Documentation

6.238.2.1 activemq::wireformat::openwire::marshal::v4::ConsumerInfoMarshaller::ConsumerInfoMar () [inline]

6.238.2.2 virtual activemq::wireformat::openwire::marshal::v4::ConsumerInfoMarshaller::~ConsumerInfoMa () [inline, virtual]

6.238.3 Member Function Documentation

6.238.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ConsumerInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.238.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::ConsumerInfoMarshaller::getDataStructureTy () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.238.3.3 virtual void activemq::wireformat::openwire::marshal::v4::ConsumerInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 672).

6.238.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ConsumerInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 673).

6.238.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ConsumerInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 674).

6.238.3.6 virtual void activemq::wireformat::openwire::marshal::v4::ConsumerInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 675).

6.238.3.7 virtual void activemq::wireformat::openwire::marshal::v4::ConsumerInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 676).

6.239.3 Member Function Documentation

6.239.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ConsumerInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.239.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::ConsumerInfoMarshaller::getDataStructureTy () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.239.3.3 virtual void activemq::wireformat::openwire::marshal::v5::ConsumerInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 679).

6.239.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ConsumerInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 680).

6.239.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ConsumerInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 681).

6.239.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ConsumerInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 682).

6.239.3.7 virtual void activemq::wireformat::openwire::marshal::v5::ConsumerInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 683).

6.240.3 Member Function Documentation

6.240.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.240.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::getDataStructureTy () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.240.3.3 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 686).

6.240.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 687).

6.240.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 688).

6.240.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 689).

6.240.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 690).

6.242.1 Constructor & Destructor Documentation

6.242.1.1 activemq::commands::ControlCommand::ControlCommand (const ControlCommand &) [inline, protected]

6.242.1.2 activemq::commands::ControlCommand::ControlCommand ()

6.242.1.3 virtual activemq::commands::ControlCommand::~ControlCommand () [virtual]

6.242.2 Member Function Documentation

6.242.2.1 virtual ControlCommand* activemq::commands::ControlCommand::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.242.2.2 virtual void activemq::commands::ControlCommand::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.242.2.3 virtual bool activemq::commands::ControlCommand::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.242.2.4 virtual std::string& activemq::commands::ControlCommand::getCommand () [virtual]

6.242.2.5 virtual const std::string& activemq::commands::ControlCommand::getCommand () const [virtual]

6.242.2.6 virtual unsigned char activemq::commands::ControlCommand::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.242.2.7 ControlCommand& activemq::commands::ControlCommand::operator= (const ControlCommand &) [inline, protected]

6.242.2.8 virtual void activemq::commands::ControlCommand::setCommand (const std::string & *command*) [virtual]

6.242.2.9 virtual std::string activemq::commands::ControlCommand::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 655).

6.242.2.10 virtual Pointer<Command> activemq::commands::ControlCommand::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1067).

6.242.3 Field Documentation

6.242.3.1 std::string activemq::commands::ControlCommand::command [protected]

6.243 activemq::wireformat::openwire::marshal::v3::ControlCommandMa Class Reference

Marshaling code for Open Wire Format for **ControlCommandMarshaller** (p. 1334).

`#include <src/main/activemq/wireformat/openwire/marshal/v3/ControlCommandMarshaller.h>`Inheritance diagram for activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller:

Public Member Functions

- **ControlCommandMarshaller** ()
- virtual ~**ControlCommandMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.243.1 Detailed Description

Marshaling code for Open Wire Format for **ControlCommandMarshaller** (p. 1334). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.243.2 Constructor & Destructor Documentation

6.243.2.1 activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller::ControlComma () [inline]

6.243.2.2 virtual activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller::~ControlComm () [inline, virtual]

6.243.3 Member Function Documentation

6.243.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.243.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller::getDataStructur () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.243.3.3 virtual void activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 658).

6.243.3.4 virtual void activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 659).

6.243.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 660).

6.243.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 661).

6.243.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 662).

The documentation for this class was generated from the following file:

6.244.2.1 activemq::wireformat::openwire::marshal::v4::ControlCommandMarshaller::ControlComma () [inline]

6.244.2.2 virtual activemq::wireformat::openwire::marshal::v4::ControlCommandMarshaller::~ControlComm () [inline, virtual]

6.244.3 Member Function Documentation

6.244.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ControlCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.244.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::ControlCommandMarshaller::getDataStructur () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.244.3.3 virtual void activemq::wireformat::openwire::marshal::v4::ControlCommandMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 672).

6.244.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ControlCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 673).

6.244.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ControlCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 674).

6.244.3.6 virtual void activemq::wireformat::openwire::marshal::v4::ControlCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 675).

6.244.3.7 virtual void activemq::wireformat::openwire::marshal::v4::ControlCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 676).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.246.3.3 virtual void activemq::wireformat::openwire::marshal::v5::ControlCommandMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 679).

6.246.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ControlCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 680).

6.246.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ControlCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 681).

6.246.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ControlCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 682).

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.247.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::getDataStructur () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.247.3.3 virtual void activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 686).

6.247.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 687).

6.247.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 688).

6.247.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 689).

6.247.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 690).

6.248 decaf::util::concurrent::CountDownLatch Class Reference

`#include <src/main/decaf/util/concurrent/CountDownLatch.h>`

Public Member Functions

- **CountDownLatch** (int count)
  Constructor.
- virtual ~**CountDownLatch** ()
- virtual void **await** () throw (lang::Exception)
  Waits for the Count to be zero, and then returns.
- virtual bool **await** (unsigned long timeOut) throw (lang::Exception)
  Waits for the Count to hit zero, or a timeout.
- virtual void **countDown** ()
  Counts down the latch, releasing all waiting threads when the count hits zero.
- virtual int **getCount** () const
  Gets the current count.

6.248.1 Constructor & Destructor Documentation

6.248.1.1 decaf::util::concurrent::CountDownLatch::CountDownLatch (int *count*)

Constructor.

Parameters:

count - number to count down from.

6.248.1.2 virtual decaf::util::concurrent::CountDownLatch::~CountDownLatch () [virtual]

6.248.2 Member Function Documentation

6.248.2.1 virtual bool decaf::util::concurrent::CountDownLatch::await (unsigned long *timeOut*) throw (lang::Exception) [virtual]

Waits for the Count to hit zero, or a timeout.

Parameters:

timeOut - time in milliseconds to wait.

Returns:

true if the wait made it to count zero, otherwise false

6.248.2.2 virtual void decaf::util::concurrent::CountDownLatch::await () throw (lang::Exception) [virtual]

Waits for the Count to be zero, and then returns.

Exceptions:

Exception

6.248.2.3 virtual void decaf::util::concurrent::CountDownLatch::countDown () [virtual]

Counts down the latch, releasing all waiting threads when the count hits zero.

6.248.2.4 virtual int decaf::util::concurrent::CountDownLatch::getCount () const [inline, virtual]

Gets the current count.

Returns:

int count value

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**CountDownLatch.h**

6.249 activemq::commands::DataArrayResponse Class Reference

`#include <src/main/activemq/commands/DataArrayResponse.h>`Inheritance diagram for activemq::commands::DataArrayResponse:

Public Member Functions

- **DataArrayResponse** ()
- virtual ~**DataArrayResponse** ()
- virtual unsigned char **getDataStructureType** () const

  Get the unique identifier that this object and its own Marshaler share.

- virtual **DataArrayResponse** * **cloneDataStructure** () const

  Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

  Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent.*

- virtual const std::vector< **decaf::lang::Pointer**< **DataStructure** > > & **getData** () const
- virtual std::vector< **decaf::lang::Pointer**< **DataStructure** > > & **getData** ()
- virtual void **setData** (const std::vector< **decaf::lang::Pointer**< **DataStructure** > > &**data**)

Static Public Attributes

- static const unsigned char **ID_DATAARRAYRESPONSE** = 33

Protected Member Functions

- **DataArrayResponse** (const **DataArrayResponse** &)
- **DataArrayResponse** & **operator**= (const **DataArrayResponse** &)

Protected Attributes

- std::vector< **decaf::lang::Pointer**< **DataStructure** > > **data**

6.249.1 Constructor & Destructor Documentation

6.249.1.1 activemq::commands::DataArrayResponse::DataArrayResponse (const DataArrayResponse &) [inline, protected]

6.249.1.2 activemq::commands::DataArrayResponse::DataArrayResponse ()

6.249.1.3 virtual activemq::commands::DataArrayResponse::~DataArrayResponse () [virtual]

6.249.2 Member Function Documentation

6.249.2.1 virtual DataArrayResponse* activemq::commands::DataArrayResponse::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::Response** (p. 2782).

6.249.2.2 virtual void activemq::commands::DataArrayResponse::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::Response** (p. 2782).

6.249.2.3 virtual bool activemq::commands::DataArrayResponse::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::Response** (p. 2782).

6.249.2.4 virtual std::vector< decaf::lang::Pointer<DataStructure> >& activemq::commands::DataArrayResponse::getData () [virtual]

6.249.2.5 virtual const std::vector< decaf::lang::Pointer<DataStructure> >& activemq::commands::DataArrayResponse::getData () const [virtual]

6.249.2.6 virtual unsigned char activemq::commands::DataArrayResponse::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Reimplemented from **activemq::commands::Response** (p. 2783).

6.249.2.7 DataArrayResponse& activemq::commands::DataArrayResponse::operator= (const DataArrayResponse &) [inline, protected]

6.249.2.8 virtual void activemq::commands::DataArrayResponse::setData (const std::vector< decaf::lang::Pointer< DataStructure > > & *data*) [virtual]

6.249.2.9 virtual std::string activemq::commands::DataArrayResponse::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::Response** (p. 2783).

6.249.3 Field Documentation

6.249.3.1 std::vector< decaf::lang::Pointer<DataStructure> > activemq::commands::DataArrayResponse::data [protected]

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.250.1 Detailed Description

Marshaling code for Open Wire Format for **DataArrayResponseMarshaller** (p. 1359). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.250.2 Constructor & Destructor Documentation

6.250.2.1 activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::DataArrayR () [inline]

6.250.2.2 virtual activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::~DataArray () [inline, virtual]

6.250.3 Member Function Documentation

6.250.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2797).

6.250.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::getDataStruct () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2797).

6.250.3.3 virtual void activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2797).

6.250.3.4 virtual void activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::looseUnmarsh (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2798).

6.250.3.5 virtual int activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2798).

6.250.3.6 virtual void activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2799).

6.250.3.7 virtual void activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::tightUnmarsha (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2800).

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2808).

6.252.3.6 virtual void activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2809).

6.252.3.7 virtual void activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::tightUnmarsha (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2810).

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2792).

6.254.3.4 virtual void activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::looseUnmarsh (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2793).

6.254.3.5 virtual int activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2793).

6.255 decaf::io::DataInputStream Class Reference

A data input stream lets an application read primitive Java data types from an underlying input stream in a machine-independent way.

`#include <src/main/decaf/io/DataInputStream.h>`Inheritance diagram for decaf::io::DataInputStream:

Public Member Functions

- **DataInputStream** (**InputStream** ∗**inputStream**, bool **own**=false)

  *Creates a **DataInputStream** (p. 1379) that uses the specified underlying **InputStream** (p. 1740).*

- virtual ∼**DataInputStream** ()
- virtual int **read** () throw (IOException)

  Reads the next byte of data from this input stream.

- virtual int **read** (std::vector< unsigned char > &buffer) throw (io::IOException)

  Reads some number of bytes from the contained input stream and stores them into the buffer array b.

- virtual int **read** (unsigned char ∗buffer, std::size_t offset, std::size_t length) throw (io::IOException, lang::exceptions::NullPointerException)

  Reads up to len bytes of data from the contained input stream into an array of bytes.

- virtual bool **readBoolean** () throw (io::IOException, io::EOFException)

  Reads one input byte and returns true if that byte is nonzero, false if that byte is zero.

- virtual char **readByte** () throw (io::IOException, io::EOFException)

  Reads and returns one input byte.

- virtual unsigned char **readUnsignedByte** () throw (io::IOException, io::EOFException)

  Reads one input byte, zero-extends it to type int, and returns the result, which is therefore in the range 0 through 255.

- virtual char **readChar** () throw (io::IOException, io::EOFException)

  Reads an input char and returns the char value.

- virtual double **readDouble** () throw (io::IOException, io::EOFException)

  Reads eight input bytes and returns a double value.

- virtual float **readFloat** () throw (io::IOException, io::EOFException)

  Reads four input bytes and returns a float value.

- virtual int **readInt** () throw (io::IOException, io::EOFException)

  Reads four input bytes and returns an int value.

- virtual long long **readLong** () throw (io::IOException, io::EOFException)

  Reads eight input bytes and returns a long value.

- virtual short **readShort** () throw (io::IOException, io::EOFException)

  Reads two input bytes and returns a short value.

- virtual unsigned short **readUnsignedShort** () throw (io::IOException, io::EOFException)

  Reads two input bytes and returns an int value in the range 0 through 65535.

- virtual std::string **readString** () throw (io::IOException, io::EOFException)

  Reads an null terminated ASCII string to the stream and returns the string to the caller.

- virtual std::string **readUTF** () throw (io::IOException, io::EOFException, io::UTFDataFormatException)

  Reads a modified UTF-8 encoded string in ASCII format and returns it, this is only useful if you know for sure that the string that is to be read was a string that contained all ASCII values (0-255), if so this method will throw a UTFFormatException.

- virtual void **readFully** (std::vector< unsigned char > &buffer) throw (io::IOException, io::EOFException)

  Reads some bytes from an input stream and stores them into the buffer array buffer.

- virtual void **readFully** (unsigned char *buffer, std::size_t offset, std::size_t length) throw (io::IOException, io::EOFException, lang::exceptions::NullPointerException)

  Reads length bytes from an input stream.

- virtual std::size_t **skip** (std::size_t num) throw (io::IOException, lang::exceptions::UnsupportedOperationException)

  Makes an attempt to skip over n bytes of data from the input stream, discarding the skipped bytes.

6.255.1 Detailed Description

A data input stream lets an application read primitive Java data types from an underlying input stream in a machine-independent way. An application uses a data output stream to write data that can later be read by a data input stream.

Due to the lack of garbage collection in C++ a design decision was made to add a boolean parameter to the constructor indicating if the wrapped `InputStream (p. 1740)` is owned by this object. That way creation of the underlying stream can occur in a Java like way. Ex:

DataInputStream (p. 1379) os = new **DataInputStream** (p. 1379)(new InputStream(), true)

Since:

1.0

6.255.2 Constructor & Destructor Documentation

6.255.2.1 decaf::io::DataInputStream::DataInputStream (InputStream * *inputStream*, bool *own* = `false`)

Creates a **DataInputStream** (p. 1379) that uses the specified underlying **InputStream** (p. 1740).

Parameters:

inputStream the **InputStream** (p. 1740) instance to wrap.

own indicates if this class owns the wrapped string defaults to false.

6.255.2.2 virtual decaf::io::DataInputStream::~DataInputStream () `[virtual]`

6.255.3 Member Function Documentation

6.255.3.1 virtual int decaf::io::DataInputStream::read (unsigned char * *buffer*, std::size_t *offset*, std::size_t *length*) throw (io::IOException, lang::exceptions::NullPointerException) `[virtual]`

Reads up to len bytes of data from the contained input stream into an array of bytes. An attempt is made to read as many as len bytes, but a smaller number may be read, possibly zero. The number of bytes actually read is returned as an integer.

This method blocks until input data is available, end of file is detected, or an exception is thrown.

If buffer is null, a NullPointerException is thrown.

If off is negative, or len is negative then an IndexOutOfBoundsException is thrown, if off + len is greater that the allocated length of the array, an **IOException** (p. 1820) will result depending on the platform and compiler settings.

If len is zero, then no bytes are read and 0 is returned; otherwise, there is an attempt to read at least one byte. If no byte is available because the stream is at end of file, the value -1 is returned; otherwise, at least one byte is read and stored into buffer.

The first byte read is stored into element b[off], the next one into buffer[off+1], and so on. The number of bytes read is, at most, equal to len. Let k be the number of bytes actually read; these bytes will be stored in elements buffer[off] through buffer[off+k-1], leaving elements buffer[off+k] through buffer[off+len-1] unaffected.

In every case, elements buffer[0] through buffer[off] and elements buffer[off+len] through buffer[buffer.length-1] are unaffected.

If the first byte cannot be read for any reason other than end of file, then an **IOException** (p. 1820) is thrown. In particular, an **IOException** (p. 1820) is thrown if the input stream has been closed.

Parameters:

buffer - byte array to insert read data into

offset - location in buffer to start writing

length - number of bytes to read

Returns:

the total number of bytes read, or -1 if there is no more data because the stream is EOF.

Exceptions:

IOException *(*p. *1820)*

NullPointerException if the buffer is null

Reimplemented from **decaf::io::FilterInputStream** (p. 1635).

6.255.3.2 virtual int decaf::io::DataInputStream::read (std::vector< unsigned char > & *buffer*) throw (io::IOException) [virtual]

Reads some number of bytes from the contained input stream and stores them into the buffer array b. The number of bytes actually read is returned as an integer. This method blocks until input data is available, end of file is detected, or an exception is thrown.

If the length of buffer is zero, then no bytes are read and 0 is returned; otherwise, there is an attempt to read at least one byte. If no byte is available because the stream is at end of file, the value -1 is returned; otherwise, at least one byte is read and stored into buffer.

The first byte read is stored into element buffer[0], the next one into buffer[1], and so on. The number of bytes read is, at most, equal to the length of buffer. Let k be the number of bytes actually read; these bytes will be stored in elements b[0] through b[k-1], leaving elements buffer[k] through buffer[buffer.length-1] unaffected.

If the first byte cannot be read for any reason other than end of file, then an **IOException** (p. 1820) is thrown. In particular, an **IOException** (p. 1820) is thrown if the input stream has been closed.

The read(buffer) method has the same effect as: read(buffer, 0, b.length)

Parameters:

buffer - byte array to insert read data into

Returns:

the total number of bytes read, or -1 if there is no more data because the stream is EOF.

Exceptions:

IOException *(*p. *1820)*

6.255.3.3 virtual int decaf::io::DataInputStream::read () throw (IOException) [inline, virtual]

Reads the next byte of data from this input stream. The value byte is returned as an unsigned char in the range 0 to 255. If no byte is available because the end of the stream has been reached, the value -1 is returned. This method blocks until input data is available, the end of the stream is detected, or an exception is thrown. This method simply performs in.read() and returns the result.

Returns:

The next byte.

Exceptions:

IOException *(*p. *1820)* thrown if an error occurs.

Reimplemented from **decaf::io::FilterInputStream** (p. 1636).

References decaf::io::FilterInputStream::read().

6.255.3.4 virtual bool decaf::io::DataInputStream::readBoolean () throw (io::IOException, io::EOFException) [virtual]

Reads one input byte and returns true if that byte is nonzero, false if that byte is zero.

Returns:

the boolean value read.

Exceptions:

IOException *(p. 1820)*

EOFException *(p. 1571)*

6.255.3.5 virtual char decaf::io::DataInputStream::readByte () throw (io::IOException, io::EOFException) [virtual]

Reads and returns one input byte. The byte is treated as a signed value in the range -128 through 127, inclusive.

Returns:

the 8-bit value read.

Exceptions:

IOException *(p. 1820)*

EOFException *(p. 1571)*

6.255.3.6 virtual char decaf::io::DataInputStream::readChar () throw (io::IOException, io::EOFException) [virtual]

Reads an input char and returns the char value. A ascii char is made up of one bytes. This returns the same result as `readByte`

Returns:

the 8 bit char read

Exceptions:

IOException *(p. 1820)*

EOFException *(p. 1571)*

6.255.3.7 virtual double decaf::io::DataInputStream::readDouble () throw (io::IOException, io::EOFException) [virtual]

Reads eight input bytes and returns a double value. It does this by first constructing a long long value in exactly the manner of the readlong method, then converting this long value to a double in exactly the manner of the method Double.longBitsToDouble.

Returns:

the double value read

Exceptions:

IOException (p. ***1820***)

EOFException (p. ***1571***)

6.255.3.8 virtual float decaf::io::DataInputStream::readFloat () throw (io::IOException, io::EOFException) [virtual]

Reads four input bytes and returns a float value. It does this by first constructing an int value in exactly the manner of the readInt method, then converting this int value to a float in exactly the manner of the method Float.intBitsToFloat.

Returns:

the float value read

Exceptions:

IOException (p. ***1820***)

EOFException (p. ***1571***)

6.255.3.9 virtual void decaf::io::DataInputStream::readFully (unsigned char * *buffer*, std::size_t *offset*, std::size_t *length*) throw (io::IOException, io::EOFException, lang::exceptions::NullPointerException) [virtual]

Reads length bytes from an input stream. This method blocks until one of the following conditions occurs: * length bytes of input data are available, in which case a normal return is made. * End of file is detected, in which case an **EOFException** (p. 1571) is thrown. * An I/O error occurs, in which case an **IOException** (p. 1820) other than **EOFException** (p. 1571) is thrown.

If buffer is null, a NullPointerException is thrown. If offset is negative, or len is negative, or offset+length is greater than the length of the array buffer, then an IndexOutOfBoundsException is thrown. If len is zero, then no bytes are read. Otherwise, the first byte read is stored into element buffer[off], the next one into buffer[offset+1], and so on. The number of bytes read is, at most, equal to len.

Parameters:

buffer - byte array to insert read data into

offset - location in buffer to start writing

length - number of bytes to read

Exceptions:

IOException *(*p. ***1820****)*

EOFException *(*p. ***1571****)*

NullPointerException if the buffer is null

6.255.3.10 virtual void decaf::io::DataInputStream::readFully (std::vector< unsigned char > & *buffer*) throw (io::IOException, io::EOFException) [virtual]

Reads some bytes from an input stream and stores them into the buffer array buffer. The number of bytes read is equal to the length of buffer.

This method blocks until one of the following conditions occurs: ∗ buffer.size() bytes of input data are available, in which case a normal return is made. ∗ End of file is detected, in which case an **EOFException** (p. 1571) is thrown. ∗ An I/O error occurs, in which case an **IOException** (p. 1820) other than **EOFException** (p. 1571) is thrown.

If buffer.size() is zero, then no bytes are read. Otherwise, the first byte read is stored into element b[0], the next one into buffer[1], and so on. If an exception is thrown from this method, then it may be that some but not all bytes of buffer have been updated with data from the input stream.

Parameters:

buffer - vector of char that is read to its size()

Exceptions:

IOException *(*p. ***1820****)*

EOFException *(*p. ***1571****)*

6.255.3.11 virtual int decaf::io::DataInputStream::readInt () throw (io::IOException, io::EOFException) [virtual]

Reads four input bytes and returns an int value. Let a be the first byte read, b be the second byte, c be the third byte, and d be the fourth byte. The value returned is:

(((a & 0xff) << 24) | ((b & 0xff) << 16) | ((c & 0xff) << 8) | (d & 0xff))

Returns:

the int value read

Exceptions:

IOException *(*p. ***1820****)*

EOFException *(*p. ***1571****)*

6.255.3.12 virtual long long decaf::io::DataInputStream::readLong () throw (io::IOException, io::EOFException) [virtual]

Reads eight input bytes and returns a long value. Let a be the first byte read, b be the second byte, c be the third byte, d be the fourth byte, e be the fifth byte, f be the sixth byte, g be

the seventh byte, and h be the eighth byte. The value returned is: (((long)(a & 0xff) << 56) | ((long)(b & 0xff) << 48) | ((long)(c & 0xff) << 40) | ((long)(d & 0xff) << 32) | ((long)(e & 0xff) << 24) | ((long)(f & 0xff) << 16) | ((long)(g & 0xff) << 8) | ((long)(h & 0xff)))

Returns:

the 64 bit long long read

Exceptions:

IOException *(*p. ***1820****)*

EOFException *(*p. ***1571****)*

6.255.3.13 virtual short decaf::io::DataInputStream::readShort () throw (io::IOException, io::EOFException) [virtual]

Reads two input bytes and returns a short value. Let a be the first byte read and b be the second byte. The value returned is: (short)((a << 8) | (b & 0xff))

Returns:

the 16 bit short value read

Exceptions:

IOException *(*p. ***1820****)*

EOFException *(*p. ***1571****)*

6.255.3.14 virtual std::string decaf::io::DataInputStream::readString () throw (io::IOException, io::EOFException) [virtual]

Reads an null terminated ASCII string to the stream and returns the string to the caller.

Returns:

string object containing the string read.

Exceptions:

IOException *(*p. ***1820****)*

EOFException *(*p. ***1571****)*

6.255.3.15 virtual unsigned char decaf::io::DataInputStream::readUnsignedByte () throw (io::IOException, io::EOFException) [virtual]

Reads one input byte, zero-extends it to type int, and returns the result, which is therefore in the range 0 through 255.

Returns:

the 8 bit unsigned value read

Exceptions:

IOException *(*p. ***1820****)*

EOFException *(*p. ***1571****)*

6.255.3.16 virtual unsigned short decaf::io::DataInputStream::readUnsignedShort () throw (io::IOException, io::EOFException) [virtual]

Reads two input bytes and returns an int value in the range 0 through 65535. Let a be the first byte read and b be the second byte. The value returned is: (((a & 0xff) << 8) | (b & 0xff))

Returns:

the 16 bit unsigned short read

Exceptions:

IOException *(*p. ***1820****)*

EOFException *(*p. ***1571****)*

6.255.3.17 virtual std::string decaf::io::DataInputStream::readUTF () throw (io::IOException, io::EOFException, io::UTFDataFormatException) [virtual]

Reads a modified UTF-8 encoded string in ASCII format and returns it, this is only useful if you know for sure that the string that is to be read was a string that contained all ASCII values (0-255), if so this method will throw a UTFFormatException. This method reads String value written from a Java **DataOutputStream** (p. 1388) and assumes that the length prefix the precedes the encoded UTF-8 bytes is an unsigned short, which implies that the String will be no longer than 65535 characters.

Returns:

The decoded string read from stream.

Exceptions:

IOException *(*p. ***1820****)*

EOFException *(*p. ***1571****)*

UTFDataFormatException *(*p. ***3353****)*

6.255.3.18 virtual std::size_t decaf::io::DataInputStream::skip (std::size_t *num*) throw (io::IOException, lang::exceptions::UnsupportedOperationException) [virtual]

Makes an attempt to skip over n bytes of data from the input stream, discarding the skipped bytes. However, it may skip over some smaller number of bytes, possibly zero. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. This method never throws an **EOFException** (p. 1571). The actual number of bytes skipped is returned.

Parameters:

num - number of bytes to skip

Returns:

the total number of bytes skipped

Reimplemented from **decaf::io::FilterInputStream** (p. 1637).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**DataInputStream.h**

6.256 decaf::io::DataOutputStream Class Reference

A data output stream lets an application write primitive Java data types to an output stream in a portable way.

`#include <src/main/decaf/io/DataOutputStream.h>`Inheritance diagram for decaf::io::DataOutputStream:

Public Member Functions

- **DataOutputStream** (**OutputStream** ∗**outputStream**, bool **own**=false)

  Creates a new data output stream to write data to the specified underlying output stream.

- virtual ∼**DataOutputStream** ()
- virtual std::size_t **size** () const

  Returns the current value of the counter written, the number of bytes written to this data output stream so far.

- virtual void **write** (unsigned char c) throw (IOException)

  Writes a single byte to the output stream.

- virtual void **write** (const unsigned char ∗**buffer**, std::size_t offset, std::size_t len) throw (IOException, lang::exceptions::NullPointerException)

  Writes an array of bytes to the output stream.

- virtual void **write** (const std::vector< unsigned char > &**buffer**) throw (IOException)

  Writes an array of bytes to the output stream.

- virtual void **writeBoolean** (bool value) throw (IOException)

  Writes a boolean to the underlying output stream as a 1-byte value.

- virtual void **writeByte** (unsigned char value) throw (IOException)

  Writes out a byte to the underlying output stream as a 1-byte value.

- virtual void **writeShort** (short value) throw (IOException)

  Writes a short to the underlying output stream as two bytes, high byte first.

- virtual void **writeUnsignedShort** (unsigned short value) throw (IOException)

  Writes a unsigned short to the bytes message stream as a 2 byte value.

- virtual void **writeChar** (char value) throw (IOException)

  Writes out a char to the underlying output stream as a one byte value If no exception is thrown, the counter written is incremented by 1.

- virtual void **writeInt** (int value) throw (IOException)

  Writes an int to the underlying output stream as four bytes, high byte first.

- virtual void **writeLong** (long long value) throw (IOException)

  Writes an 64 bit long to the underlying output stream as eight bytes, high byte first.

- virtual void **writeFloat** (float value) throw (IOException)

  Converts the float argument to an int using the floatToIntBits method in class Float, and then writes that int value to the underlying output stream as a 4-byte quantity, high byte first.

- virtual void **writeDouble** (double value) throw (IOException)

  Converts the double argument to a long using the doubleToLongBits method in class Double, and then writes that long value to the underlying output stream as an 8-byte quantity, high byte first.

- virtual void **writeBytes** (const std::string &value) throw (IOException)

  Writes out the string to the underlying output stream as a sequence of bytes.

- virtual void **writeChars** (const std::string &value) throw (IOException)

  Writes a string to the underlying output stream as a sequence of characters.

- virtual void **writeUTF** (const std::string &value) throw (IOException, UTFDataFormatException)

  Writes out the string to the underlying output stream as a modeified UTF-8 encoded sequence of bytes.

Protected Attributes

- std::size_t **written**
- unsigned char **buffer** [8]

6.256.1 Detailed Description

A data output stream lets an application write primitive Java data types to an output stream in a portable way. An application can then use a data input stream to read the data back in.

6.256.2 Constructor & Destructor Documentation

6.256.2.1 decaf::io::DataOutputStream::DataOutputStream (OutputStream * *outputStream*, bool *own* = `false`)

Creates a new data output stream to write data to the specified underlying output stream.

Parameters:

outputStream a stream to wrap with this one.

own true if this objects owns the stream that it wraps.

6.256.2.2 virtual decaf::io::DataOutputStream::~DataOutputStream () [virtual]

6.256.3 Member Function Documentation

6.256.3.1 virtual std::size_t decaf::io::DataOutputStream::size () const [inline, virtual]

Returns the current value of the counter written, the number of bytes written to this data output stream so far. If the counter overflows, it will be wrapped to Integer.MAX_VALUE.

Returns:

the value of the written field.

6.256.3.2 virtual void decaf::io::DataOutputStream::write (const std::vector< unsigned char > & *buffer*) throw (IOException) [virtual]

Writes an array of bytes to the output stream.

Parameters:

buffer The bytes to write.

Exceptions:

IOException *(*p. ***1820****)* thrown if an error occurs.

Reimplemented from **decaf::io::FilterOutputStream** (p. 1646).

6.256.3.3 virtual void decaf::io::DataOutputStream::write (const unsigned char * *buffer*, std::size_t *offset*, std::size_t *len*) throw (IOException, lang::exceptions::NullPointerException) [virtual]

Writes an array of bytes to the output stream. the counter written is incremented by len.

Parameters:

buffer The array of bytes to write.

offset the position in buffer to start writing from.

len The number of bytes from the buffer to be written.

Exceptions:

IOException *(*p. ***1820****)* thrown if an error occurs.

NullPointerException if buffer is Null

Reimplemented from **decaf::io::FilterOutputStream** (p. 1645).

6.256.3.4 virtual void decaf::io::DataOutputStream::write (unsigned char *c*) throw (IOException) [virtual]

Writes a single byte to the output stream. If no exception is thrown, the counter written is incremented by 1.

Parameters:

c the byte.

Exceptions:

IOException *(*p. ***1820)*** thrown if an error occurs.

Reimplemented from **decaf::io::FilterOutputStream** (p. 1646).

6.256.3.5 virtual void decaf::io::DataOutputStream::writeBoolean (bool *value*) throw (IOException) [virtual]

Writes a boolean to the underlying output stream as a 1-byte value. The value true is written out as the value (byte)1; the value false is written out as the value (byte)0. If no exception is thrown, the counter written is incremented by 1.

Parameters:

value the boolean to write.

Exceptions:

IOException *(*p. ***1820)***

6.256.3.6 virtual void decaf::io::DataOutputStream::writeByte (unsigned char *value*) throw (IOException) [virtual]

Writes out a byte to the underlying output stream as a 1-byte value. If no exception is thrown, the counter written is incremented by 1.

Parameters:

value the unsigned char value to write.

Exceptions:

IOException *(*p. ***1820)***

6.256.3.7 virtual void decaf::io::DataOutputStream::writeBytes (const std::string & *value*) throw (IOException) [virtual]

Writes out the string to the underlying output stream as a sequence of bytes. Each character in the string is written out, in sequence, by discarding its high eight bits. If no exception is thrown, the counter written is incremented by the length of value. The value written does not include a trailing null as that is not part of the sequence of bytes, if the null is needed, then use the writeChars method.

Parameters:

value the value to write.

Exceptions:

IOException *(*p. ***1820)***

6.256.3.8 virtual void decaf::io::DataOutputStream::writeChar (char *value*) throw (IOException) [virtual]

Writes out a char to the underlying output stream as a one byte value If no exception is thrown, the counter written is incremented by 1.

Parameters:

value the value to write.

Exceptions:

IOException *(*p. ***1820****)*

6.256.3.9 virtual void decaf::io::DataOutputStream::writeChars (const std::string & *value*) throw (IOException) [virtual]

Writes a string to the underlying output stream as a sequence of characters. Each character is written to the data output stream as if by the writeChar method. If no exception is thrown, the counter written is incremented by the length of value. The trailing NULL character is written by this method.

Parameters:

value the value to write.

Exceptions:

IOException *(*p. ***1820****)*

6.256.3.10 virtual void decaf::io::DataOutputStream::writeDouble (double *value*) throw (IOException) [virtual]

Converts the double argument to a long using the doubleToLongBits method in class Double, and then writes that long value to the underlying output stream as an 8-byte quantity, high byte first. If no exception is thrown, the counter written is incremented by 8.

Parameters:

value the value to write.

Exceptions:

IOException *(*p. ***1820****)*

6.256.3.11 virtual void decaf::io::DataOutputStream::writeFloat (float *value*) throw (IOException) [virtual]

Converts the float argument to an int using the floatToIntBits method in class Float, and then writes that int value to the underlying output stream as a 4-byte quantity, high byte first. If no exception is thrown, the counter written is incremented by 4.

Parameters:

value the value to write.

Exceptions:

IOException *(*p. *1820)*

6.256.3.12 virtual void decaf::io::DataOutputStream::writeInt (int *value*) throw (IOException) [virtual]

Writes an int to the underlying output stream as four bytes, high byte first. If no exception is thrown, the counter written is incremented by 4.

Parameters:

value the value to write.

Exceptions:

IOException *(*p. *1820)*

6.256.3.13 virtual void decaf::io::DataOutputStream::writeLong (long long *value*) throw (IOException) [virtual]

Writes an 64 bit long to the underlying output stream as eight bytes, high byte first. If no exception is thrown, the counter written is incremented by 8.

Parameters:

value the value to write.

Exceptions:

IOException *(*p. *1820)*

6.256.3.14 virtual void decaf::io::DataOutputStream::writeShort (short *value*) throw (IOException) [virtual]

Writes a short to the underlying output stream as two bytes, high byte first. If no exception is thrown, the counter written is incremented by 2.

Parameters:

value the value to write.

Exceptions:

IOException *(*p. *1820)*

6.256.3.15 virtual void decaf::io::DataOutputStream::writeUnsignedShort (unsigned short *value*) throw (IOException) [virtual]

Writes a unsigned short to the bytes message stream as a 2 byte value.

Parameters:

value - unsigned short to write to the stream

Exceptions:

IOException (p. ***1820***)

6.256.3.16 virtual void decaf::io::DataOutputStream::writeUTF (const std::string & *value*) throw (IOException, UTFDataFormatException) [virtual]

Writes out the string to the underlying output stream as a modeified UTF-8 encoded sequence of bytes. The first two bytes written are indicate its encoded length followed by the rest of the string's characters encoded as modified UTF-8. The length represent the encoded length of the data not the actual length of the string.

Parameters:

value the value to write.

Exceptions:

IOException (p. ***1820***) - on a write error

UTFDataFormatException (p. ***3353***) - if encoded size if greater than 65535

6.256.4 Field Documentation

6.257.1 Constructor & Destructor Documentation

6.257.1.1 activemq::commands::DataResponse::DataResponse (const DataResponse &) [inline, protected]

6.257.1.2 activemq::commands::DataResponse::DataResponse ()

6.257.1.3 virtual activemq::commands::DataResponse::~DataResponse () [virtual]

6.257.2 Member Function Documentation

6.257.2.1 virtual DataResponse* activemq::commands::DataResponse::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::Response** (p. 2782).

6.257.2.2 virtual void activemq::commands::DataResponse::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::Response** (p. 2782).

6.257.2.3 virtual bool activemq::commands::DataResponse::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::Response** (p. 2782).

6.257.2.4 virtual Pointer<DataStructure>& activemq::commands::DataResponse::getData () [virtual]

6.257.2.5 virtual const Pointer<DataStructure>& activemq::commands::DataResponse::getData () const [virtual]

6.257.2.6 virtual unsigned char activemq::commands::DataResponse::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Reimplemented from **activemq::commands::Response** (p. 2783).

6.257.2.7 DataResponse& activemq::commands::DataResponse::operator= (const DataResponse &) [inline, protected]

6.257.2.8 virtual void activemq::commands::DataResponse::setData (const Pointer< DataStructure > & *data*) [virtual]

6.257.2.9 virtual std::string activemq::commands::DataResponse::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::Response** (p. 2783).

6.257.3 Field Documentation

6.258.1 Detailed Description

Marshaling code for Open Wire Format for **DataResponseMarshaller** (p. 1398). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.258.2 Constructor & Destructor Documentation

6.258.2.1 activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::DataResponseMar () [inline]

6.258.2.2 virtual activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::~DataResponseM () [inline, virtual]

6.258.3 Member Function Documentation

6.258.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2797).

6.258.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::getDataStructureTy () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2797).

6.258.3.3 virtual void activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2797).

6.258.3.4 virtual void activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2798).

6.258.3.5 virtual int activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2798).

6.258.3.6 virtual void activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2799).

6.258.3.7 virtual void activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2800).

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2807).

6.259.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::getDataStructureTy () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2807).

6.259.3.3 virtual void activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2807).

6.259.3.4 virtual void activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2808).

6.259.3.5 virtual int activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2808).

6.259.3.6 virtual void activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2809).

6.259.3.7 virtual void activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2810).

6.260.3 Member Function Documentation

6.260.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2802).

6.260.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller::getDataStructureTy () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2802).

6.260.3.3 virtual void activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2802).

6.260.3.4 virtual void activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2803).

6.260.3.5 virtual int activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2803).

6.260.3.6 virtual void activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2804).

6.260.3.7 virtual void activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2805).

6.263.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::DataStreamMarshaller::getDataStructureType () const [pure virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns:

byte Id of this classes DataStructureType

Implemented in **activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller** (p. 182), **activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller** (p. 218), **activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller** (p. 327), **activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller** (p. 350), **activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller** (p. 391), **activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller** (p. 428), **activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller** (p. 484), **activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller** (p. 533), **activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller** (p. 558), **activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller** (p. 583), **activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller** (p. 607), **activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller** (p. 760), **activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller** (p. 788), **activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller** (p. 1145), **activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller** (p. 1169),

tivemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller (p. 1157), activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller (p. 1181), activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller (p. 1208), activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller (p. 1234), activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller (p. 1272), activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller (p. 1297), activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller (p. 1326), activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller (p. 1351), activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller (p. 1376), activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller (p. 1415), activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller (p. 1490), activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller (p. 1516), activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller (p. 1586), activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller (p. 1680), activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller (p. 1781), activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller (p. 1839), activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller (p. 1864), activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller (p. 1887), activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller (p. 1911), activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller (p. 1934), activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller (p. 1962), activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller (p. 1998), activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller (p. 2195), activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller (p. 2232), activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller (p. 2258), activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller (p. 2285), activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller (p. 2352), activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller (p. 2398), activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller (p. 2478), activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller (p. 2584), activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller (p. 2612), activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller (p. 2637), activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller (p. 2716), activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller (p. 2737), activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller (p. 2757), activemq::wireformat::openwire::marshal::v2::ResponseMarshaller (p. 2792), activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller (p. 2866), activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller (p. 2882), activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller (p. 2950), activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller (p. 3119), activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller (p. 3262), activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller (p. 3380), activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller (p. 3416), activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller (p. 178), activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller (p. 214), activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller (p. 323), activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller (p. 346), activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller (p. 387), activemq::wireformat::openwire::marshal::v3::ActiveMQQueueMarshaller (p. 424), activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller (p. 480), activemq::wireformat::openwire::marshal::v3::ActiveMQTempQueueMarshaller (p. 529), activemq::wireformat::openwire::marshal::v3::ActiveMQTempTopicMarshaller (p. 554), activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller (p. 579), activemq::wireformat::openwire::marshal::v3::ActiveMQTopicMarshaller

(p. 603), **activemq::wireformat::openwire::marshal::v3::BrokerIdMarshaller** (p. 756), **activemq::wireformat::openwire::marshal::v3::BrokerInfoMarshaller** (p. 784), **activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller** (p. 1141), **activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller** (p. 1165), **activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller** (p. 1192), **activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller** (p. 1218), **activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller** (p. 1256), **activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller** (p. 1281), **activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller** (p. 1310), **activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller** (p. 1335), **activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller** (p. 1360), **activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller** (p. 1399), **activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller** (p. 1494), **activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller** (p. 1520), **activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller** (p. 1594), **activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller** (p. 1688), **activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller** (p. 1789), **activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller** (p. 1847), **activemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller** (p. 1872), **activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller** (p. 1895), **activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller** (p. 1915), **activemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller** (p. 1942), **activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller** (p. 1970), **activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller** (p. 2002), **activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller** (p. 2203), **activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller** (p. 2240), **activemq::wireformat::openwire::marshal::v3::MessageDispatchNotificationMarshaller** (p. 2266), **activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller** (p. 2293), **activemq::wireformat::openwire::marshal::v3::MessagePullMarshaller** (p. 2356), **activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller** (p. 2402), **activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller** (p. 2482), **activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller** (p. 2588), **activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller** (p. 2616), **activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller** (p. 2641), **activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller** (p. 2720), **activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller** (p. 2745), **activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller** (p. 2761), **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2797), **activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller** (p. 2874), **activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller** (p. 2898), **activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller** (p. 2946), **activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller** (p. 3107), **activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller** (p. 3250), **activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller** (p. 3396), **activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller** (p. 3420), **activemq::wireformat::openwire::marshal::v4::ActiveMQBlobMessageMarshaller** (p. 186), **activemq::wireformat::openwire::marshal::v4::ActiveMQBytesMessageMarshaller** (p. 222), **activemq::wireformat::openwire::marshal::v4::ActiveMQMapMessageMarshaller** (p. 331), **activemq::wireformat::openwire::marshal::v4::ActiveMQMessageMarshaller** (p. 354), **activemq::wireformat::openwire::marshal::v4::ActiveMQObjectMessageMarshaller** (p. 395), **activemq::wireformat::openwire::marshal::v4::ActiveMQQueueMarshaller** (p. 432), **activemq::wireformat::openwire::marshal::v4::ActiveMQStreamMessageMarshaller** (p. 488), **activemq::wireformat::openwire::marshal::v4::ActiveMQTempQueueMarshaller** (p. 537), **activemq::wireformat::openwire::marshal::v4::ActiveMQTempTopicMarshaller**

6.263.3.3 virtual void activemq::wireformat::openwire::marshal::DataStreamMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) throw (decaf::io::IOException) [pure virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - DataOutputStream to marshal to

Exceptions:

IOException if an error occurs.

Implemented in **activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller** (p. 182), **activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller** (p. 218), **activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller** (p. 290), **activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller** (p. 327), **activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller** (p. 350), **activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller** (p. 391), **activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller** (p. 428), **activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller** (p. 484), **activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller** (p. 508), **activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller** (p. 533), **activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller** (p. 558), **activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller** (p. 583), **activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller** (p. 607), **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 665), **activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller** (p. 760), **activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller** (p. 788), **activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller** (p. 1145), **activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller** (p. 1169), **activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller** (p. 1196), **activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller** (p. 1226), **activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller** (p. 1264), **activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller** (p. 1289), **activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller** (p. 1314), **activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller** (p. 1343), **activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller** (p. 1368), **activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller** (p. 1403), **activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller** (p. 1502), **activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller** (p. 1532), **activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller** (p. 1590), **activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller** (p. 1684), **activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller** (p. 1785), **activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller** (p. 1851), **activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller** (p. 1868), **activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller** (p. 1899), **activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller** (p. 1923), **activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller** (p. 1950),

6.263.3.4 virtual void activemq::wireformat::openwire::marshal::DataStreamMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) throw (decaf::io::IOException) [pure virtual]

Loose Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

Exceptions:

IOException if an error occurs.

Implemented in **activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller** (p. 183), **activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller** (p. 219), **activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller** (p. 290), **activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller** (p. 328), **activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller** (p. 351), **activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller** (p. 392), **activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller** (p. 429), **activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller** (p. 485), **activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller** (p. 508), **activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller** (p. 534), **activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller** (p. 559), **activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller** (p. 584), **activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller** (p. 608), **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 666), **activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller** (p. 761), **activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller** (p. 789), **activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller** (p. 1146), **activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller** (p. 1170), **activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller** (p. 1197), **activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller** (p. 1227), **activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller** (p. 1265), **activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller** (p. 1290), **activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller** (p. 1315), **activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller** (p. 1344), **activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller** (p. 1369), **activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller** (p. 1404), **activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller** (p. 1503), **activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller** (p. 1533), **activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller** (p. 1591), **activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller** (p. 1685), **activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller** (p. 1786), **activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller** (p. 1852), **activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller** (p. 1869), **activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller** (p. 1900), **activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller** (p. 1924), **activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller** (p. 1951),

6.263.3.5 virtual int activemq::wireformat::openwire::marshal::DataStreamMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [pure virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

bs - boolean stream to marshal to.

Exceptions:

IOException if an error occurs.

Implemented in **activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller** (p. 183), **activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller** (p. 219), **activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller** (p. 291), **activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller** (p. 328), **activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller** (p. 351), **activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller** (p. 392), **activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller** (p. 429), **activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller** (p. 485), **activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller** (p. 509), **activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller** (p. 534), **activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller** (p. 559), **activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller** (p. 584), **activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller** (p. 608), **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 667), **activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller** (p. 761), **activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller** (p. 789), **activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller** (p. 1146), **activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller** (p. 1170), **activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller** (p. 1197), **activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller** (p. 1227), **activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller** (p. 1265), **activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller** (p. 1290), **activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller** (p. 1315), **activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller** (p. 1344), **activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller** (p. 1369), **activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller** (p. 1404), **activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller** (p. 1503), **activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller** (p. 1533), **activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller** (p. 1591), **activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller** (p. 1685), **activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller** (p. 1786), **activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller** (p. 1852), **activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller** (p. 1869), **activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller** (p. 1900), **activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller** (p. 1924), **activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller** (p. 1951),

6.263.3.6 virtual void activemq::wireformat::openwire::marshal::DataStreamMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [pure virtual]

Tight Marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to marshal to.

Exceptions:

IOException if an error occurs.

6.263.3.7 virtual void activemq::wireformat::openwire::marshal::DataStreamMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [pure virtual]

Tight Un-marhsal to the given stream.

Parameters:

format - The OpenwireFormat properties

command - the object to Un-Marshal

dis - the DataInputStream to Un-Marshal from

bs - boolean stream to unmarshal from.

Exceptions:

IOException if an error occurs.

Implemented in **activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller** (p. 184), **activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller** (p. 220), **activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller** (p. 292), **activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller** (p. 329), **activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller** (p. 352), **activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller** (p. 393), **activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller** (p. 430), **activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller** (p. 486), **activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller** (p. 510), **activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller** (p. 535), **activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller** (p. 560), **activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller** (p. 585), **activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller** (p. 609), **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 669), **activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller** (p. 762), **activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller** (p. 790), **activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller** (p. 1147), **activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller** (p. 1171), **activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller** (p. 1198), **activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller** (p. 1228), **activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller** (p. 1266), **activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller** (p. 1291), **activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller** (p. 1316), **activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller** (p. 1345), **activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller** (p. 1370), **activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller** (p. 1405), **activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller** (p. 1504), **activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller** (p. 1534), **activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller** (p. 1592), **activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller** (p. 1686), **activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller** (p. 1787), **activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller** (p. 1853), **activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller** (p. 1870), **activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller** (p. 1901), **activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller** (p. 1925),

6.264 activemq::commands::DataStructure Class Reference

`#include <src/main/activemq/commands/DataStructure.h>`Inheritance diagram for activemq::commands::DataStructure:

Public Member Functions

- virtual ~**DataStructure** ()
- virtual unsigned char **getDataStructureType** () const =0

  *Get the **DataStructure** (p. 1461) Type as defined in CommandTypes.h.*

- virtual **DataStructure** * **cloneDataStructure** () const =0

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)=0

  Copy the contents of the passed object into this objects members, overwriting any existing data.

- virtual std::string **toString** () const =0

  *Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const =0

  *Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent.*

6.264.1 Constructor & Destructor Documentation

6.264.1.1 virtual activemq::commands::DataStructure::~DataStructure () [inline, virtual]

6.264.2 Member Function Documentation

6.264.2.1 virtual DataStructure* activemq::commands::DataStructure::cloneDataStructure () const [pure virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implemented in **activemq::commands::ActiveMQBlobMessage** (p. 173), **activemq::commands::ActiveMQBytesMessage** (p. 200), **activemq::commands::ActiveMQDestination** (p. 276), **activemq::commands::ActiveMQMapMessage** (p. 312), **activemq::commands::ActiveMQMessage** (p. 343), **activemq::commands::ActiveMQObjectMessage**

(p. 384), **activemq::commands::ActiveMQQueue** (p. 420), **activemq::commands::ActiveMQStreamMessage** (p. 467), **activemq::commands::ActiveMQTempDestination** (p. 500), **activemq::commands::ActiveMQTempQueue** (p. 524), **activemq::commands::ActiveMQTempTopic** (p. 549), **activemq::commands::ActiveMQTextMessage** (p. 575), **activemq::commands::ActiveMQTopic** (p. 599), **activemq::commands::BooleanExpression** (p. 737), **activemq::commands::BrokerError** (p. 746), **activemq::commands::BrokerId** (p. 752), **activemq::commands::BrokerInfo** (p. 777), **activemq::commands::ConnectionControl** (p. 1136), **activemq::commands::ConnectionError** (p. 1161), **activemq::commands::ConnectionId** (p. 1188), **activemq::commands::ConnectionInfo** (p. 1212), **activemq::commands::ConsumerControl** (p. 1251), **activemq::commands::ConsumerId** (p. 1276), **activemq::commands::ConsumerInfo** (p. 1302), **activemq::commands::ControlCommand** (p. 1331), **activemq::commands::DataArrayResponse** (p. 1357), **activemq::commands::DataResponse** (p. 1396), **activemq::commands::DestinationInfo** (p. 1485), **activemq::commands::DiscoveryEvent** (p. 1512), **activemq::commands::ExceptionResponse** (p. 1583), **activemq::commands::FlushCommand** (p. 1677), **activemq::commands::IntegerResponse** (p. 1778), **activemq::commands::JournalQueueAck** (p. 1835), **activemq::commands::JournalTopicAck** (p. 1859), **activemq::commands::JournalTrace** (p. 1884), **activemq::commands::JournalTransaction** (p. 1907), **activemq::commands::KeepAliveInfo** (p. 1931), **activemq::commands::LastPartialCommand** (p. 1959), **activemq::commands::LocalTransactionId** (p. 1994), **activemq::commands::Message** (p. 2149), **activemq::commands::MessageAck** (p. 2189), **activemq::commands::MessageDispatch** (p. 2220), **activemq::commands::MessageDispatchNotification** (p. 2252), **activemq::commands::MessageId** (p. 2280), **activemq::commands::MessagePull** (p. 2347), **activemq::commands::NetworkBridgeFilter** (p. 2394), **activemq::commands::PartialCommand** (p. 2474), **activemq::commands::ProducerAck** (p. 2580), **activemq::commands::ProducerId** (p. 2607), **activemq::commands::ProducerInfo** (p. 2632), **activemq::commands::RemoveInfo** (p. 2704), **activemq::commands::RemoveSubscriptionInfo** (p. 2728), **activemq::commands::ReplayCommand** (p. 2753), **activemq::commands::Response** (p. 2782), **activemq::commands::SessionId** (p. 2854), **activemq::commands::SessionInfo** (p. 2878), **activemq::commands::ShutdownInfo** (p. 2935), **activemq::commands::SubscriptionInfo** (p. 3098), **activemq::commands::TransactionId** (p. 3218), **activemq::commands::TransactionInfo** (p. 3241), **activemq::commands::WireFormatInfo** (p. 3372), and **activemq::commands::XATransactionId** (p. 3411).

6.264.2.2 virtual void activemq::commands::DataStructure::copyDataStructure (const DataStructure * *src*) [pure virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns:

src - Source Object

Implemented in **activemq::commands::ActiveMQBlobMessage** (p. 173), **activemq::commands::ActiveMQBytesMessage** (p. 201), **activemq::commands::ActiveMQDestination** (p. 277), **activemq::commands::ActiveMQMapMessage** (p. 312), **activemq::commands::ActiveMQMessage** (p. 343), **activemq::commands::ActiveMQObjectMessage**

(p. 384), **activemq::commands::ActiveMQQueue** (p. 420), **activemq::commands::ActiveMQStreamMessage** (p. 467), **activemq::commands::ActiveMQTempDestination** (p. 500), **activemq::commands::ActiveMQTempQueue** (p. 525), **activemq::commands::ActiveMQTempTopic** (p. 550), **activemq::commands::ActiveMQTextMessage** (p. 575), **activemq::commands::ActiveMQTopic** (p. 599), **activemq::commands::BaseCommand** (p. 651), **activemq::commands::BrokerError** (p. 746), **activemq::commands::BrokerId** (p. 752), **activemq::commands::BrokerInfo** (p. 777), **activemq::commands::ConnectionControl** (p. 1136), **activemq::commands::ConnectionError** (p. 1161), **activemq::commands::ConnectionId** (p. 1188), **activemq::commands::ConnectionInfo** (p. 1213), **activemq::commands::ConsumerControl** (p. 1251), **activemq::commands::ConsumerId** (p. 1276), **activemq::commands::ConsumerInfo** (p. 1302), **activemq::commands::ControlCommand** (p. 1331), **activemq::commands::DataArrayResponse** (p. 1357), **activemq::commands::DataResponse** (p. 1396), **activemq::commands::DestinationInfo** (p. 1485), **activemq::commands::DiscoveryEvent** (p. 1512), **activemq::commands::ExceptionResponse** (p. 1583), **activemq::commands::FlushCommand** (p. 1677), **activemq::commands::IntegerResponse** (p. 1778), **activemq::commands::JournalQueueAck** (p. 1835), **activemq::commands::JournalTopicAck** (p. 1859), **activemq::commands::JournalTrace** (p. 1884), **activemq::commands::JournalTransaction** (p. 1907), **activemq::commands::KeepAliveInfo** (p. 1931), **activemq::commands::LastPartialCommand** (p. 1959), **activemq::commands::LocalTransactionId** (p. 1994), **activemq::commands::Message** (p. 2150), **activemq::commands::MessageAck** (p. 2189), **activemq::commands::MessageDispatch** (p. 2220), **activemq::commands::MessageDispatchNotification** (p. 2252), **activemq::commands::MessageId** (p. 2280), **activemq::commands::MessagePull** (p. 2347), **activemq::commands::NetworkBridgeFilter** (p. 2394), **activemq::commands::PartialCommand** (p. 2474), **activemq::commands::ProducerAck** (p. 2580), **activemq::commands::ProducerId** (p. 2607), **activemq::commands::ProducerInfo** (p. 2632), **activemq::commands::RemoveInfo** (p. 2704), **activemq::commands::RemoveSubscriptionInfo** (p. 2728), **activemq::commands::ReplayCommand** (p. 2753), **activemq::commands::Response** (p. 2782), **activemq::commands::SessionId** (p. 2854), **activemq::commands::SessionInfo** (p. 2878), **activemq::commands::ShutdownInfo** (p. 2935), **activemq::commands::SubscriptionInfo** (p. 3098), **activemq::commands::TransactionId** (p. 3218), **activemq::commands::TransactionInfo** (p. 3241), **activemq::commands::WireFormatInfo** (p. 3372), and **activemq::commands::XATransactionId** (p. 3411).

6.264.2.3 virtual bool activemq::commands::DataStructure::equals (const DataStructure * *value*) const [pure virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Implemented in **activemq::commands::ActiveMQBlobMessage** (p. 174), **activemq::commands::ActiveMQBytesMessage** (p. 201), **activemq::commands::ActiveMQDestination** (p. 278), **ac-**

tivemq::commands::ActiveMQMapMessage (p. 312), **activemq::commands::ActiveMQMessage** (p. 343), **activemq::commands::ActiveMQMessageTemplate< T >** (p. 369), **activemq::commands::ActiveMQObjectMessage** (p. 384), **activemq::commands::ActiveMQQueue** (p. 421), **activemq::commands::ActiveMQStreamMessage** (p. 468), **activemq::commands::ActiveMQTempDestination** (p. 501), **activemq::commands::ActiveMQTempQueue** (p. 525), **activemq::commands::ActiveMQTempTopic** (p. 550), **activemq::commands::ActiveMQTextMessage** (p. 575), **activemq::commands::ActiveMQTopic** (p. 600), **activemq::commands::BaseCommand** (p. 651), **activemq::commands::BooleanExpression** (p. 738), **activemq::commands::BrokerId** (p. 752), **activemq::commands::BrokerInfo** (p. 777), **activemq::commands::ConnectionControl** (p. 1137), **activemq::commands::ConnectionError** (p. 1161), **activemq::commands::ConnectionId** (p. 1189), **activemq::commands::ConnectionInfo** (p. 1213), **activemq::commands::ConsumerControl** (p. 1252), **activemq::commands::ConsumerId** (p. 1277), **activemq::commands::ConsumerInfo** (p. 1303), **activemq::commands::ControlCommand** (p. 1331), **activemq::commands::DataArrayResponse** (p. 1357), **activemq::commands::DataResponse** (p. 1396), **activemq::commands::DestinationInfo** (p. 1486), **activemq::commands::DiscoveryEvent** (p. 1512), **activemq::commands::ExceptionResponse** (p. 1583), **activemq::commands::FlushCommand** (p. 1677), **activemq::commands::IntegerResponse** (p. 1778), **activemq::commands::JournalQueueAck** (p. 1835), **activemq::commands::JournalTopicAck** (p. 1860), **activemq::commands::JournalTrace** (p. 1884), **activemq::commands::JournalTransaction** (p. 1907), **activemq::commands::KeepAliveInfo** (p. 1931), **activemq::commands::LastPartialCommand** (p. 1959), **activemq::commands::LocalTransactionId** (p. 1995), **activemq::commands::Message** (p. 2150), **activemq::commands::MessageAck** (p. 2190), **activemq::commands::MessageDispatch** (p. 2221), **activemq::commands::MessageDispatchNotification** (p. 2253), **activemq::commands::MessageId** (p. 2281), **activemq::commands::MessagePull** (p. 2348), **activemq::commands::NetworkBridgeFilter** (p. 2394), **activemq::commands::PartialCommand** (p. 2474), **activemq::commands::ProducerAck** (p. 2580), **activemq::commands::ProducerId** (p. 2608), **activemq::commands::ProducerInfo** (p. 2633), **activemq::commands::RemoveInfo** (p. 2704), **activemq::commands::RemoveSubscriptionInfo** (p. 2729), **activemq::commands::ReplayCommand** (p. 2753), **activemq::commands::Response** (p. 2782), **activemq::commands::SessionId** (p. 2855), **activemq::commands::SessionInfo** (p. 2878), **activemq::commands::ShutdownInfo** (p. 2935), **activemq::commands::SubscriptionInfo** (p. 3099), **activemq::commands::TransactionId** (p. 3218), **activemq::commands::TransactionInfo** (p. 3241), **activemq::commands::WireFormatInfo** (p. 3372), **activemq::commands::XATransactionId** (p. 3412), **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 369), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 369), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 369), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 369), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 369), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 369).

6.264.2.4 virtual unsigned char activemq::commands::DataStructure::getDataStructureType () const [pure virtual]

Get the **DataStructure** (p. 1461) Type as defined in CommandTypes.h.

Returns:

The type of the data structure

Implemented in **activemq::commands::ActiveMQBlobMessage** (p. 174), **activemq::commands::ActiveMQBytesMessage** (p. 202), **activemq::commands::ActiveMQDestination** (p. 278), **activemq::commands::ActiveMQMapMessage** (p. 314), **activemq::commands::ActiveMQMessage** (p. 343), **activemq::commands::ActiveMQObjectMessage** (p. 385), **activemq::commands::ActiveMQQueue** (p. 421), **activemq::commands::ActiveMQStreamMessage** (p. 468), **activemq::commands::ActiveMQTempDestination** (p. 501), **activemq::commands::ActiveMQTempQueue** (p. 526), **activemq::commands::ActiveMQTempTopic** (p. 551), **activemq::commands::ActiveMQTextMessage** (p. 575), **activemq::commands::ActiveMQTopic** (p. 600), **activemq::commands::BrokerError** (p. 747), **activemq::commands::BrokerId** (p. 753), **activemq::commands::BrokerInfo** (p. 778), **activemq::commands::ConnectionControl** (p. 1137), **activemq::commands::ConnectionError** (p. 1162), **activemq::commands::ConnectionId** (p. 1189), **activemq::commands::ConnectionInfo** (p. 1213), **activemq::commands::ConsumerControl** (p. 1252), **activemq::commands::ConsumerId** (p. 1277), **activemq::commands::ConsumerInfo** (p. 1303), **activemq::commands::ControlCommand** (p. 1332), **activemq::commands::DataArrayResponse** (p. 1358), **activemq::commands::DataResponse** (p. 1397), **activemq::commands::DestinationInfo** (p. 1486), **activemq::commands::DiscoveryEvent** (p. 1513), **activemq::commands::ExceptionResponse** (p. 1583), **activemq::commands::FlushCommand** (p. 1677), **activemq::commands::IntegerResponse** (p. 1778), **activemq::commands::JournalQueueAck** (p. 1835), **activemq::commands::JournalTopicAck** (p. 1860), **activemq::commands::JournalTrace** (p. 1884), **activemq::commands::JournalTransaction** (p. 1908), **activemq::commands::KeepAliveInfo** (p. 1931), **activemq::commands::LastPartialCommand** (p. 1960), **activemq::commands::LocalTransactionId** (p. 1995), **activemq::commands::Message** (p. 2152), **activemq::commands::MessageAck** (p. 2190), **activemq::commands::MessageDispatch** (p. 2221), **activemq::commands::MessageDispatchNotification** (p. 2253), **activemq::commands::MessageId** (p. 2281), **activemq::commands::MessagePull** (p. 2348), **activemq::commands::NetworkBridgeFilter** (p. 2395), **activemq::commands::PartialCommand** (p. 2475), **activemq::commands::ProducerAck** (p. 2581), **activemq::commands::ProducerId** (p. 2608), **activemq::commands::ProducerInfo** (p. 2633), **activemq::commands::RemoveInfo** (p. 2705), **activemq::commands::RemoveSubscriptionInfo** (p. 2729), **activemq::commands::ReplayCommand** (p. 2754), **activemq::commands::Response** (p. 2783), **activemq::commands::SessionId** (p. 2855), **activemq::commands::SessionInfo** (p. 2879), **activemq::commands::ShutdownInfo** (p. 2935), **activemq::commands::SubscriptionInfo** (p. 3099), **activemq::commands::TransactionId** (p. 3219), **activemq::commands::TransactionInfo** (p. 3242), **activemq::commands::WireFormatInfo** (p. 3373), and **activemq::commands::XATransactionId** (p. 3412).

6.264.2.5 virtual std::string activemq::commands::DataStructure::toString () const [pure virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Implemented in **activemq::commands::ActiveMQBlobMessage** (p. 176), **activemq::commands::ActiveMQBytesMessage** (p. 208), **activemq::commands::ActiveMQDestination** (p. 282), **activemq::commands::ActiveMQMapMessage** (p. 320), **activemq::commands::ActiveMQMessage** (p. 344), **activemq::commands::ActiveMQObjectMessage** (p. 385), **activemq::commands::ActiveMQQueue** (p. 422), **activemq::commands::ActiveMQStreamMessage** (p. 474), **activemq::commands::ActiveMQTempDestination** (p. 501), **activemq::commands::ActiveMQTempQueue** (p. 526), **activemq::commands::ActiveMQTempTopic** (p. 551), **activemq::commands::ActiveMQTextMessage** (p. 577), **activemq::commands::ActiveMQTopic** (p. 601), **activemq::commands::BaseCommand** (p. 655), **activemq::commands::BaseDataStructure** (p. 718), **activemq::commands::BooleanExpression** (p. 738), **activemq::commands::BrokerId** (p. 753), **activemq::commands::BrokerInfo** (p. 780), **activemq::commands::Command** (p. 1067), **activemq::commands::ConnectionControl** (p. 1138), **activemq::commands::ConnectionError** (p. 1162), **activemq::commands::ConnectionId** (p. 1189), **activemq::commands::ConnectionInfo** (p. 1215), **activemq::commands::ConsumerControl** (p. 1253), **activemq::commands::ConsumerId** (p. 1278), **activemq::commands::ConsumerInfo** (p. 1305), **activemq::commands::ControlCommand** (p. 1332), **activemq::commands::DataArrayResponse** (p. 1358), **activemq::commands::DataResponse** (p. 1397), **activemq::commands::DestinationInfo** (p. 1487), **activemq::commands::DiscoveryEvent** (p. 1513), **activemq::commands::ExceptionResponse** (p. 1584), **activemq::commands::FlushCommand** (p. 1678), **activemq::commands::IntegerResponse** (p. 1779), **activemq::commands::JournalQueueAck** (p. 1836), **activemq::commands::JournalTopicAck** (p. 1861), **activemq::commands::JournalTrace** (p. 1885), **activemq::commands::JournalTransaction** (p. 1908), **activemq::commands::KeepAliveInfo** (p. 1932), **activemq::commands::LastPartialCommand** (p. 1960), **activemq::commands::LocalTransactionId** (p. 1996), **activemq::commands::Message** (p. 2159), **activemq::commands::MessageAck** (p. 2192), **activemq::commands::MessageDispatch** (p. 2222), **activemq::commands::MessageDispatchNotification** (p. 2255), **activemq::commands::MessageId** (p. 2282), **activemq::commands::MessagePull** (p. 2349), **activemq::commands::NetworkBridgeFilter** (p. 2395), **activemq::commands::PartialCommand** (p. 2475), **activemq::commands::ProducerAck** (p. 2581), **activemq::commands::ProducerId** (p. 2609), **activemq::commands::ProducerInfo** (p. 2634), **activemq::commands::RemoveInfo** (p. 2705), **activemq::commands::RemoveSubscriptionInfo** (p. 2730), **activemq::commands::ReplayCommand** (p. 2754), **activemq::commands::Response** (p. 2783), **activemq::commands::SessionId** (p. 2856), **activemq::commands::SessionInfo** (p. 2879), **activemq::commands::ShutdownInfo** (p. 2936), **activemq::commands::SubscriptionInfo** (p. 3100), **activemq::commands::TransactionId** (p. 3219), **activemq::commands::TransactionInfo**

(p. 3243), **activemq::commands::WireFormatInfo** (p. 3378), and **activemq::commands::XATransactionId** (p. 3413).

6.265 decaf::util::Date Class Reference

Wrapper class around a time value in milliseconds.

`#include <src/main/decaf/util/Date.h>`Inheritance diagram for decaf::util::Date:

Public Member Functions

- **Date** ()

  Default constructor - sets time to the current System time, rounded to the nearest millisecond.

- **Date** (long long milliseconds)

  Constructs the date with a given time value.

- **Date** (const **Date** &source)

  Copy constructor.

- **Date** & **operator**= (const **Date** &value)

  *Assigns the value of one **Date** (p. 1467) object to another.*

- virtual ~**Date** ()
- long long **getTime** () const

  Gets the underlying time.

- void **setTime** (long long milliseconds)

  Sets the underlying time.

- bool **after** (const **Date** &when) const

  Determines whether or not this date falls after the specified time.

- bool **before** (const **Date** &when) const

  Determines whether or not this date falls before the specified time.

- std::string **toString** () const

  *Converts this **Date** (p. 1467) object to a String of the form:.*

- virtual int **compareTo** (const **Date** &value) const

  Compares this Data object to the one given.

- virtual bool **equals** (const **Date** &value) const
- virtual bool **operator**== (const **Date** &value) const

  Compares equality between this object and the one passed.

- virtual bool **operator**< (const **Date** &value) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

6.265.1 Detailed Description

Wrapper class around a time value in milliseconds. This class is comparable to Java's java.util.Date class.

Since:

1.0

6.265.2 Constructor & Destructor Documentation

6.265.2.1 decaf::util::Date::Date ()

Default constructor - sets time to the current System time, rounded to the nearest millisecond.

6.265.2.2 decaf::util::Date::Date (long long *milliseconds*)

Constructs the date with a given time value.

Parameters:

milliseconds The time in milliseconds;

6.265.2.3 decaf::util::Date::Date (const Date & *source*)

Copy constructor.

Parameters:

source The **Date** (p. 1467) instance to copy into this one.

6.265.2.4 virtual decaf::util::Date::~Date () [virtual]

6.265.3 Member Function Documentation

6.265.3.1 bool decaf::util::Date::after (const Date & *when*) const

Determines whether or not this date falls after the specified time.

Parameters:

when The date to compare

Returns:

true if this date falls after when.

6.265.3.2 bool decaf::util::Date::before (const Date & *when*) const

Determines whether or not this date falls before the specified time.

Parameters:

when The date to compare

Returns:

true if this date falls before when.

6.265.3.3 virtual int decaf::util::Date::compareTo (const Date & *value*) const [virtual]

Compares this Data object to the one given.

Parameters:

value The **Date** (p. 1467) value to compare to this one.

Returns:

zero if the **Date** (p. 1467) values are equal, a value less than zero if this Data value is earlier than argument value, and a value greater than zero if this **Date** (p. 1467) object is later than the argument **Date** (p. 1467) value.

6.265.3.4 virtual bool decaf::util::Date::equals (const Date & *value*) const [virtual]

Returns:

true if this value is considered equal to the passed value.

6.265.3.5 long long decaf::util::Date::getTime () const

Gets the underlying time.

Returns:

The underlying time value in milliseconds.

6.265.3.6 virtual bool decaf::util::Date::operator< (const Date & *value*) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.265.3.7 Date& decaf::util::Date::operator= (const Date & *value*)

Assigns the value of one **Date** (p. 1467) object to another.

Parameters:

value The value to be copied into this **Date** (p. 1467) object.

Returns:

reference to this object with the newly assigned value.

6.265.3.8 virtual bool decaf::util::Date::operator== (const Date & *value*) const [virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.265.3.9 void decaf::util::Date::setTime (long long *milliseconds*)

Sets the underlying time.

Parameters:

milliseconds The underlying time value in milliseconds.

6.265.3.10 std::string decaf::util::Date::toString () const

Converts this **Date** (p. 1467) object to a String of the form:. dow mon dd hh:mm:ss zzz yyyy where:

- dow is the day of the week (Sun, Mon, Tue, Wed, Thu, Fri, Sat).
- mon is the month (Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, Dec).
- dd is the day of the month (01 through 31), as two decimal digits.
- hh is the hour of the day (00 through 23), as two decimal digits.
- mm is the minute within the hour (00 through 59), as two decimal digits.
- ss is the second within the minute (00 through 61, as two decimal digits.
- zzz is the time zone (and may reflect daylight saving time). Standard time zone abbreviations include those recognized by the method parse. If time zone information is not available, then zzz is empty - that is, it consists of no characters at all.

- yyyy is the year, as four decimal digits.

Returns:

the String representation of the **Date** (p. 1467) object.

The documentation for this class was generated from the following file:

- src/main/decaf/util/**Date.h**

6.266 decaf::internal::DecafRuntime Class Reference

Handles APR initialization and termination.

`#include <src/main/decaf/internal/DecafRuntime.h>`Inheritance diagram for decaf::internal::DecafRuntime:

Public Member Functions

- **DecafRuntime** ()
  Initializes the APR Runtime for a library.
- virtual ~**DecafRuntime** ()
  Terminates the APR Runtime for a library.
- apr_pool_t * **getGlobalPool** () const
  Grants access to the Global APR Pool instance that should be used when creating new threads.

6.266.1 Detailed Description

Handles APR initialization and termination.

6.266.2 Constructor & Destructor Documentation

6.266.2.1 decaf::internal::DecafRuntime::DecafRuntime ()

Initializes the APR Runtime for a library.

6.266.2.2 virtual decaf::internal::DecafRuntime::~DecafRuntime () [virtual]

Terminates the APR Runtime for a library.

6.266.3 Member Function Documentation

6.266.3.1 apr_pool_t* decaf::internal::DecafRuntime::getGlobalPool () const

Grants access to the Global APR Pool instance that should be used when creating new threads.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/**DecafRuntime.h**

6.267 activemq::threads::DedicatedTaskRunner Class Reference

`#include <src/main/activemq/threads/DedicatedTaskRunner.h>`Inheritance diagram for activemq::threads::DedicatedTaskRunner:

Public Member Functions

- **DedicatedTaskRunner** (**Task** *task)
- virtual ~**DedicatedTaskRunner** ()
- virtual void **shutdown** (unsigned int timeout)

  Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

- virtual void **shutdown** ()

  Shutdown once the task has finished and the TaskRunner's thread has exited.

- virtual void **wakeup** ()

  *Signal the **TaskRunner** (p. 3150) to wakeup and execute another iteration cycle on the task, the **Task** (p. 3148) instance will be run until its iterate method has returned false indicating it is done.*

Protected Member Functions

- virtual void **run** ()

  Run method - called by the Thread class in the context of the thread.

6.267.1 Constructor & Destructor Documentation

6.267.1.1 activemq::threads::DedicatedTaskRunner::DedicatedTaskRunner (Task * *task*)

6.267.1.2 virtual activemq::threads::DedicatedTaskRunner::~DedicatedTaskRunner () `[virtual]`

6.267.2 Member Function Documentation

6.267.2.1 virtual void activemq::threads::DedicatedTaskRunner::run () `[protected, virtual]`

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 2816).

6.267.2.2 virtual void activemq::threads::DedicatedTaskRunner::shutdown () [virtual]

Shutdown once the task has finished and the TaskRunner's thread has exited.

Implements **activemq::threads::TaskRunner** (p. 3150).

6.267.2.3 virtual void activemq::threads::DedicatedTaskRunner::shutdown (unsigned int *timeout*) [virtual]

Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

Parameters:

timeout - Time in Milliseconds to wait for the task to stop.

Implements **activemq::threads::TaskRunner** (p. 3150).

6.267.2.4 virtual void activemq::threads::DedicatedTaskRunner::wakeup () [virtual]

Signal the **TaskRunner** (p. 3150) to wakeup and execute another iteration cycle on the task, the **Task** (p. 3148) instance will be run until its iterate method has returned false indicating it is done.

Implements **activemq::threads::TaskRunner** (p. 3151).

The documentation for this class was generated from the following file:

- src/main/activemq/threads/**DedicatedTaskRunner.h**

6.268 activemq::transport::DefaultTransportListener Class Reference

`#include <src/main/activemq/transport/DefaultTransportListener.h>`Inheritance diagram for activemq::transport::DefaultTransportListener:

Public Member Functions

- virtual ~**DefaultTransportListener** ()
- virtual void **onCommand** (const **Pointer**< **Command** > &command AMQCPP_UNUSED)

  Event handler for the receipt of a command.

- virtual void **onException** (const **decaf::lang::Exception** &ex AMQCPP_UNUSED)

  Event handler for an exception from a command transport.

- virtual void **transportInterrupted** ()

  The transport has suffered an interruption from which it hopes to recover.

- virtual void **transportResumed** ()

  The transport has resumed after an interruption.

6.268.1 Constructor & Destructor Documentation

6.268.1.1 virtual activemq::transport::DefaultTransportListener::~DefaultTransportListener () [inline, virtual]

6.268.2 Member Function Documentation

6.268.2.1 virtual void activemq::transport::DefaultTransportListener::onCommand (const Pointer< Command > &command *AMQCPP_UNUSED*) [inline, virtual]

Event handler for the receipt of a command. The transport passes off all received commands to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 3273) deletes the command upon receipt.

Parameters:

command the received command object.

6.268.2.2 virtual void activemq::transport::DefaultTransportListener::onException (const decaf::lang::Exception &ex *AMQCPP_UNUSED*) [inline, virtual]

Event handler for an exception from a command transport.

Parameters:

ex The exception.

6.268.2.3 virtual void activemq::transport::DefaultTransportListener::transportInterrupted () [inline, virtual]

The transport has suffered an interruption from which it hopes to recover.

Implements **activemq::transport::TransportListener** (p. 3290).

6.268.2.4 virtual void activemq::transport::DefaultTransportListener::transportResumed () [inline, virtual]

The transport has resumed after an interruption.

Implements **activemq::transport::TransportListener** (p. 3290).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**DefaultTransportListener.h**

6.269 decaf::util::concurrent::Delayed Class Reference

A mix-in style interface for marking objects that should be acted upon after a given delay.

`#include <src/main/decaf/util/concurrent/Delayed.h>`Inheritance diagram for decaf::util::concurrent::Delayed:

Public Member Functions

- virtual ~**Delayed** ()
- virtual long long **getDelay** (const **TimeUnit** &unit)=0

  Returns the remaining delay associated with this object, in the given time unit.

6.269.1 Detailed Description

A mix-in style interface for marking objects that should be acted upon after a given delay. An implementation of this interface must define a Comparable methods that provides an ordering consistent with its getDelay method.

6.269.2 Constructor & Destructor Documentation

6.269.2.1 virtual decaf::util::concurrent::Delayed::~Delayed () `[inline, virtual]`

6.269.3 Member Function Documentation

6.269.3.1 virtual long long decaf::util::concurrent::Delayed::getDelay (const TimeUnit & *unit*) `[pure virtual]`

Returns the remaining delay associated with this object, in the given time unit.

Parameters:

unit The time unit

Returns:

the remaining delay; zero or negative values indicate that the delay has already elapsed

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**Delayed.h**

6.270 cms::DeliveryMode Class Reference

This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages.

`#include <src/main/cms/DeliveryMode.h>`

Public Types

- enum **DELIVERY_MODE** { **PERSISTENT** = 0, **NON_PERSISTENT** = 1 }

  *Enumeration values for **Message** (p. 2163) Delivery Mode.*

Public Member Functions

- virtual ~**DeliveryMode** ()

6.270.1 Detailed Description

This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages. When a client sends a `cms::Message` (p. 2163) it can mark the **Message** (p. 2163) as either Persistent or Non-Persistent. If the client feels that the **Message** (p. 2163) cannot be lost in transit it should mark it as Persistent, otherwise if it is allowable for a **Message** (p. 2163) to occasionally be lost it can mark it as Non-Persistent. This allows the Provider to balance make tradeoffs between balance and **Message** (p. 2163) throughput.

The **DeliveryMode** (p. 1478) covers only the transport of the **Message** (p. 2163) for sending client to its destination and doesn't apply to the receiving **Message** (p. 2163) consumer. The receiving Consumer can drop Message's based on configuration such as memory limits or **Message** (p. 2163) filtering.

A message is guaranteed to be delivered once and only once by a CMS provider if the delivery mode of the message is PERSISTENT and the configuration of the **Message** (p. 2163) consumer allows for it.

Since:

1.0

6.270.2 Member Enumeration Documentation

6.270.2.1 enum cms::DeliveryMode::DELIVERY_MODE

Enumeration values for **Message** (p. 2163) Delivery Mode.

Enumerator:

PERSISTENT

NON_PERSISTENT

6.270.3 Constructor & Destructor Documentation

6.270.3.1 virtual cms::DeliveryMode::~DeliveryMode () [inline, virtual]

The documentation for this class was generated from the following file:

- src/main/cms/**DeliveryMode.h**

6.271 cms::Destination Class Reference

A **Destination** (p. 1480) object encapsulates a provider-specific address.

`#include <src/main/cms/Destination.h>`Inheritance diagram for cms::Destination:

Public Types

- enum **DestinationType** { **TOPIC**, **QUEUE**, **TEMPORARY_TOPIC**, **TEMPORARY_QUEUE** }

Public Member Functions

- virtual ~**Destination** ()
- virtual **DestinationType** **getDestinationType** () const =0

  *Retrieve the **Destination** (p. 1480) Type for this **Destination** (p. 1480).*

- virtual **cms::Destination** * **clone** () const =0

  Creates a new instance of this destination type that is a copy of this one, and returns it.

- virtual void **copy** (const **cms::Destination** &source)=0

  *Copies the contents of the given **Destination** (p. 1480) object to this one.*

- virtual const **CMSProperties** & **getCMSProperties** () const =0

  Retrieve any properties that might be part of the destination that was specified.

6.271.1 Detailed Description

A **Destination** (p. 1480) object encapsulates a provider-specific address. There is no standard definition of a **Destination** (p. 1480) address, each provider can provide its own definition and there can be configuration data attached to the **Destination** (p. 1480) address.

All CMS **Destination** (p. 1480) objects support concurrent use.

Since:

1.0

6.271.2 Member Enumeration Documentation

6.271.2.1 enum cms::Destination::DestinationType

Enumerator:

TOPIC
QUEUE
TEMPORARY_TOPIC
TEMPORARY_QUEUE

6.271.3 Constructor & Destructor Documentation

6.271.3.1 virtual cms::Destination::~Destination () [inline, virtual]

6.271.4 Member Function Documentation

6.271.4.1 virtual cms::Destination* cms::Destination::clone () const [pure virtual]

Creates a new instance of this destination type that is a copy of this one, and returns it.

Returns:

cloned copy of this object

Implemented in **activemq::commands::ActiveMQQueue** (p. 420), **activemq::commands::ActiveMQTempQueue** (p. 524), **activemq::commands::ActiveMQTempTopic** (p. 549), and **activemq::commands::ActiveMQTopic** (p. 599).

6.271.4.2 virtual void cms::Destination::copy (const cms::Destination & *source*) [pure virtual]

Copies the contents of the given **Destination** (p. 1480) object to this one.

Parameters:

source The source **Destination** (p. 1480) object.

Implemented in **activemq::commands::ActiveMQQueue** (p. 420), **activemq::commands::ActiveMQTempQueue** (p. 524), **activemq::commands::ActiveMQTempTopic** (p. 549), and **activemq::commands::ActiveMQTopic** (p. 599).

6.271.4.3 virtual const CMSProperties& cms::Destination::getCMSProperties () const [pure virtual]

Retrieve any properties that might be part of the destination that was specified. This is a deviation from the JMS spec but necessary due to C++ restrictions.

Returns:

A {const} reference to a **CMSProperties** (p. 1036) object.

Implemented in **activemq::commands::ActiveMQQueue** (p. 421), **activemq::commands::ActiveMQTempQueue** (p. 525), **activemq::commands::ActiveMQTempTopic** (p. 550), and **activemq::commands::ActiveMQTopic** (p. 600).

6.271.4.4 virtual DestinationType cms::Destination::getDestinationType () const [pure virtual]

Retrieve the **Destination** (p. 1480) Type for this **Destination** (p. 1480).

Returns:

The **Destination** (p. 1480) Type

Implemented in **activemq::commands::ActiveMQQueue** (p. 422), **activemq::commands::ActiveMQTempQueue** (p. 526), **activemq::commands::ActiveMQTempTopic** (p. 551), and **activemq::commands::ActiveMQTopic** (p. 601).

The documentation for this class was generated from the following file:

- src/main/cms/**Destination.h**

6.272 activemq::commands::ActiveMQDestination::DestinationFilter Struct Reference

- std::vector< **decaf::lang::Pointer< BrokerId > > brokerPath**

6.273.1 Constructor & Destructor Documentation

6.273.1.1 activemq::commands::DestinationInfo::DestinationInfo (const DestinationInfo &) [inline, protected]

6.273.1.2 activemq::commands::DestinationInfo::DestinationInfo ()

6.273.1.3 virtual activemq::commands::DestinationInfo::~DestinationInfo () [virtual]

6.273.2 Member Function Documentation

6.273.2.1 virtual DestinationInfo* activemq::commands::DestinationInfo::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.273.2.2 virtual void activemq::commands::DestinationInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.273.2.3 virtual bool activemq::commands::DestinationInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.273.2.4 virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::DestinationInfo::getBrokerPath () [virtual]

6.273.2.5 virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::DestinationInfo::getBrokerPath () const [virtual]

6.273.2.6 virtual Pointer<ConnectionId>& activemq::commands::DestinationInfo::getConnectionId () [virtual]

6.273.2.7 virtual const Pointer<ConnectionId>& activemq::commands::DestinationInfo::getConnectionId () const [virtual]

6.273.2.8 virtual unsigned char activemq::commands::DestinationInfo::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.273.2.9 virtual Pointer<ActiveMQDestination>& activemq::commands::DestinationInfo::getDestination () [virtual]

6.273.2.10 virtual const Pointer<ActiveMQDestination>& activemq::commands::DestinationInfo::getDestination () const [virtual]

6.273.2.11 virtual unsigned char activemq::commands::DestinationInfo::getOperationType () const [virtual]

6.273.2.12 virtual long long activemq::commands::DestinationInfo::getTimeout () const [virtual]

6.273.2.13 DestinationInfo& activemq::commands::DestinationInfo::operator= (const DestinationInfo &) [inline, protected]

6.273.2.14 virtual void activemq::commands::DestinationInfo::setBrokerPath (const std::vector< decaf::lang::Pointer< BrokerId > > & *brokerPath*) [virtual]

6.273.2.15 virtual void activemq::commands::DestinationInfo::setConnectionId (const Pointer< ConnectionId > & *connectionId*) [virtual]

6.273.2.16 virtual void activemq::commands::DestinationInfo::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.273.2.17 virtual void activemq::commands::DestinationInfo::setOperationType (unsigned char *operationType*) [virtual]

6.273.2.18 virtual void activemq::commands::DestinationInfo::setTimeout (long long *timeout*) [virtual]

6.273.2.19 virtual std::string activemq::commands::DestinationInfo::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 655).

6.273.2.20 virtual Pointer<Command> activemq::commands::DestinationInfo::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1067).

6.273.3 Field Documentation

6.273.3.1 std::vector< decaf::lang::Pointer<BrokerId> > activemq::commands::DestinationInfo::brokerPath [protected]

6.274 activemq::wireformat::openwire::marshal::v2::DestinationInfoMars Class Reference

Marshaling code for Open Wire Format for **DestinationInfoMarshaller** (p. 1489).

`#include <src/main/activemq/wireformat/openwire/marshal/v2/DestinationInfoMarshaller.h>`Inheritanc diagram for activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller:

Public Member Functions

- **DestinationInfoMarshaller** ()
- virtual ~**DestinationInfoMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.274.1 Detailed Description

Marshaling code for Open Wire Format for **DestinationInfoMarshaller** (p. 1489). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.274.2 Constructor & Destructor Documentation

6.274.2.1 activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::DestinationInfoM () [inline]

6.274.2.2 virtual activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::~DestinationInfo () [inline, virtual]

6.274.3 Member Function Documentation

6.274.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.274.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::getDataStructureT () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.274.3.3 virtual void activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 686).

6.274.3.4 virtual void activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 687).

6.274.3.5 virtual int activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 688).

6.274.3.6 virtual void activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 689).

6.274.3.7 virtual void activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 690).

The documentation for this class was generated from the following file:

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.275.1 Detailed Description

Marshaling code for Open Wire Format for **DestinationInfoMarshaller** (p. 1493). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.275.2 Constructor & Destructor Documentation

6.275.2.1 activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::DestinationInfoM () [inline]

6.275.2.2 virtual activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::~DestinationInfo () [inline, virtual]

6.275.3 Member Function Documentation

6.275.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.275.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::getDataStructureT () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.275.3.3 virtual void activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 658).

6.275.3.4 virtual void activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 659).

6.275.3.5 virtual int activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 660).

6.275.3.6 virtual void activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 661).

6.275.3.7 virtual void activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 662).

The documentation for this class was generated from the following file:

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.276.3.3 virtual void activemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 672).

6.276.3.4 virtual void activemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 673).

6.276.3.5 virtual int activemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 674).

6.276.3.6 virtual void activemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 675).

6.276.3.7 virtual void activemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 676).

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 683).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v5/**DestinationInfoMarshaller.h**

6.279 activemq::cmsutil::DestinationResolver Class Reference

Resolves a CMS destination name to a `Destination`.

`#include <src/main/activemq/cmsutil/DestinationResolver.h>`Inheritance diagram for activemq::cmsutil::DestinationResolver:

Public Member Functions

- virtual ~**DestinationResolver** ()
- virtual void **init** (**ResourceLifecycleManager** *mgr)=0

  Initializes this destination resolver for use.

- virtual void **destroy** ()=0

  Destroys any allocated resources.

- virtual **cms::Destination** * **resolveDestinationName** (**cms::Session** *session, const std::string &destName, bool pubSubDomain)=0 throw (cms::CMSException)

  Resolves the given name to a destination.

6.279.1 Detailed Description

Resolves a CMS destination name to a `Destination`.

6.279.2 Constructor & Destructor Documentation

6.279.2.1 virtual activemq::cmsutil::DestinationResolver::~DestinationResolver () [inline, virtual]

6.279.3 Member Function Documentation

6.279.3.1 virtual void activemq::cmsutil::DestinationResolver::destroy () [pure virtual]

Destroys any allocated resources.

Implemented in **activemq::cmsutil::DynamicDestinationResolver** (p. 1568).

6.279.3.2 virtual void activemq::cmsutil::DestinationResolver::init (ResourceLifecycleManager * *mgr*) [pure virtual]

Initializes this destination resolver for use. Ensures that any previously allocated resources are first destroyed (e.g. calls **destroy()** (p. 1509)).

Parameters:

mgr the resource lifecycle manager.

Implemented in **activemq::cmsutil::DynamicDestinationResolver** (p. 1569).

6.279.3.3 virtual cms::Destination* activemq::cmsutil::DestinationResolver::resolveDestinationName (cms::Session * *session*, const std::string & *destName*, bool *pubSubDomain*) throw (cms::CMSException) [pure virtual]

Resolves the given name to a destination. If `pubSubDomain` is true, a topic will be returned, otherwise a queue will be returned.

Parameters:

session the session for which to retrieve resolve the destination.

destName the name to be resolved.

pubSubDomain If true, the name will be resolved to a Topic, otherwise a Queue.

Returns:

the resolved destination

Exceptions:

cms::CMSException *(*p. ***1031)*** if resolution failed.

Implemented in **activemq::cmsutil::DynamicDestinationResolver** (p. 1569).

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**DestinationResolver.h**

6.280 activemq::commands::DiscoveryEvent Class Reference

`#include <src/main/activemq/commands/DiscoveryEvent.h>`Inheritance diagram for activemq::commands::DiscoveryEvent:

Public Member Functions

- **DiscoveryEvent** ()
- virtual ~**DiscoveryEvent** ()
- virtual unsigned char **getDataStructureType** () const

  Get the unique identifier that this object and its own Marshaler share.

- virtual **DiscoveryEvent** * **cloneDataStructure** () const

  Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

  Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent.*

- virtual const std::string & **getServiceName** () const

6.280.1 Constructor & Destructor Documentation

6.280.1.1 activemq::commands::DiscoveryEvent::DiscoveryEvent (const DiscoveryEvent &) [inline, protected]

6.280.1.2 activemq::commands::DiscoveryEvent::DiscoveryEvent ()

6.280.1.3 virtual activemq::commands::DiscoveryEvent::~DiscoveryEvent () [virtual]

6.280.2 Member Function Documentation

6.280.2.1 virtual DiscoveryEvent* activemq::commands::DiscoveryEvent::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.280.2.2 virtual void activemq::commands::DiscoveryEvent::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Implements **activemq::commands::DataStructure** (p. 1462).

6.280.2.3 virtual bool activemq::commands::DiscoveryEvent::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1463).

6.280.2.4 virtual std::string& activemq::commands::DiscoveryEvent::getBrokerName () [virtual]

6.280.2.5 virtual const std::string& activemq::commands::DiscoveryEvent::getBrokerName () const [virtual]

6.280.2.6 virtual unsigned char activemq::commands::DiscoveryEvent::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.280.2.7 virtual std::string& activemq::commands::DiscoveryEvent::getServiceName () [virtual]

6.280.2.8 virtual const std::string& activemq::commands::DiscoveryEvent::getServiceName () const [virtual]

6.280.2.9 DiscoveryEvent& activemq::commands::DiscoveryEvent::operator= (const DiscoveryEvent &) [inline, protected]

6.280.2.10 virtual void activemq::commands::DiscoveryEvent::setBrokerName (const std::string & *brokerName*) [virtual]

6.280.2.11 virtual void activemq::commands::DiscoveryEvent::setServiceName (const std::string & *serviceName*) [virtual]

6.280.2.12 virtual std::string activemq::commands::DiscoveryEvent::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 718).

6.280.3 Field Documentation

6.280.3.1 std::string activemq::commands::DiscoveryEvent::brokerName [protected]

6.280.3.2 const unsigned char activemq::commands::DiscoveryEvent::ID_DISCOVERYEVENT = 40 [static]

6.280.3.3 std::string activemq::commands::DiscoveryEvent::serviceName [protected]

The documentation for this class was generated from the following file:

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.281.1 Detailed Description

Marshaling code for Open Wire Format for **DiscoveryEventMarshaller** (p. 1515). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.281.2 Constructor & Destructor Documentation

6.281.2.1 activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::DiscoveryEventM () [inline]

6.281.2.2 virtual activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::~DiscoveryEvent () [inline, virtual]

6.281.3 Member Function Documentation

6.281.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.281.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::getDataStructureT () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.281.3.3 virtual void activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.281.3.4 virtual void activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.281.3.5 virtual int activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.281.3.6 virtual void activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.281.3.7 virtual void activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

6.282.2.2 virtual activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::~DiscoveryEvent () [inline, virtual]

6.282.3 Member Function Documentation

6.282.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.282.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::getDataStructureT () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.282.3.3 virtual void activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.282.3.4 virtual void activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.282.3.5 virtual int activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.282.3.6 virtual void activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.282.3.7 virtual void activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.283.3.6 virtual void activemq::wireformat::openwire::marshal::v4::DiscoveryEventMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.283.3.7 virtual void activemq::wireformat::openwire::marshal::v4::DiscoveryEventMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.284.3.4 virtual void activemq::wireformat::openwire::marshal::v5::DiscoveryEventMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.284.3.5 virtual int activemq::wireformat::openwire::marshal::v5::DiscoveryEventMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.284.3.6 virtual void activemq::wireformat::openwire::marshal::v5::DiscoveryEventMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.284.3.7 virtual void activemq::wireformat::openwire::marshal::v5::DiscoveryEventMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

The documentation for this class was generated from the following file:

Marshaling code for Open Wire Format for **DiscoveryEventMarshaller** (p. 1531).

`#include <src/main/activemq/wireformat/openwire/marshal/v1/DiscoveryEventMarshaller.h>`Inheritance diagram for activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller:

Public Member Functions

- **DiscoveryEventMarshaller** ()
- virtual ~**DiscoveryEventMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.285.1 Detailed Description

Marshaling code for Open Wire Format for **DiscoveryEventMarshaller** (p. 1531). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.285.2 Constructor & Destructor Documentation

6.285.2.1 activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::DiscoveryEventM () [inline]

6.285.2.2 virtual activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::~DiscoveryEvent () [inline, virtual]

6.285.3 Member Function Documentation

6.285.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.285.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::getDataStructureT () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.285.3.3 virtual void activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.285.3.4 virtual void activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.285.3.5 virtual int activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.285.3.6 virtual void activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.285.3.7 virtual void activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

6.286.3.2 const decaf::lang::Pointer<commands::Message>& activemq::core::DispatchData::getMessage () [inline]

The documentation for this class was generated from the following file:

- src/main/activemq/core/**DispatchData.h**

6.287 activemq::core::Dispatcher Class Reference

Interface for an object responsible for dispatching messages to consumers.

`#include <src/main/activemq/core/Dispatcher.h>`Inheritance diagram for activemq::core::Dispatcher:

Public Member Functions

- virtual ~**Dispatcher** ()
- virtual void **dispatch** (const **Pointer**< **MessageDispatch** > &message)=0

  Dispatches a message to a particular consumer.

6.287.1 Detailed Description

Interface for an object responsible for dispatching messages to consumers.

6.287.2 Constructor & Destructor Documentation

6.287.2.1 virtual activemq::core::Dispatcher::~Dispatcher () `[inline, virtual]`

6.287.3 Member Function Documentation

6.287.3.1 virtual void activemq::core::Dispatcher::dispatch (const Pointer< MessageDispatch > & *message*) `[pure virtual]`

Dispatches a message to a particular consumer.

Parameters:

message - the message to be dispatched.

Implemented in **activemq::core::ActiveMQConsumer** (p. 267), and **activemq::core::ActiveMQSession** (p. 453).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**Dispatcher.h**

6.288 decaf::lang::Double Class Reference

`#include <src/main/decaf/lang/Double.h>`Inheritance diagram for decaf::lang::Double:

Public Member Functions

- **Double** (double value)
- **Double** (const std::string &value) throw (exceptions::NumberFormatException)
- virtual ~**Double** ()
- virtual int **compareTo** (const **Double** &d) const

  *Compares this **Double** (p. 1537) instance with another.*

- bool **equals** (const **Double** &d) const
- virtual bool **operator==** (const **Double** &d) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const **Double** &d) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- virtual int **compareTo** (const double &d) const

  *Compares this **Double** (p. 1537) instance with another.*

- bool **equals** (const double &d) const
- virtual bool **operator==** (const double &d) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const double &d) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- std::string **toString** () const
- virtual double **doubleValue** () const

  Answers the double value which the receiver represents.

- virtual float **floatValue** () const

  Answers the float value which the receiver represents.

- virtual unsigned char **byteValue** () const

  Answers the byte value which the receiver represents.

- virtual short **shortValue** () const

  Answers the short value which the receiver represents.

- virtual int **intValue** () const

  Answers the int value which the receiver represents.

- virtual long long **longValue** () const

Answers the long value which the receiver represents.

- bool **isInfinite** () const
- bool **isNaN** () const

Static Public Member Functions

- static int **compare** (double d1, double d2)

  Compares the two specified double values.

- static long long **doubleToLongBits** (double value)

  Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout.

- static long long **doubleToRawLongBits** (double value)

  Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout, preserving Not-a-Number (NaN) values.

- static bool **isInfinite** (double value)
- static bool **isNaN** (double value)
- static double **longBitsToDouble** (long long bits)

  Returns the double value corresponding to a given bit representation.

- static double **parseDouble** (const std::string value) throw (exceptions::NumberFormatException)

  *Returns a new double initialized to the value represented by the specified string, as performed by the valueOf method of class **Double** (p. 1537).*

- static std::string **toHexString** (double value)

  Returns a hexadecimal string representation of the double argument.

- static std::string **toString** (double value)

  Returns a string representation of the double argument.

- static **Double valueOf** (double value)

  *Returns a **Double** (p. 1537) instance representing the specified double value.*

- static **Double valueOf** (const std::string &value) throw (exceptions::NumberFormatException)

  *Returns a **Double** (p. 1537) instance that wraps a primtive double which is parsed from the string value passed.*

Static Public Attributes

- static const int **SIZE** = 64

  The size in bits of the primitive int type.

- static const double **MAX_VALUE**

  The maximum value that the primitive type can hold.

- static const double **MIN_VALUE**

  The minimum value that the primitive type can hold.

- static const double **NaN**

  *Constant for the Not a **Number** (p. 2432) Value.*

- static const double **POSITIVE_INFINITY**

  Constant for Positive Infinity.

- static const double **NEGATIVE_INFINITY**

  Constant for Negative Infinitiy.

6.288.1 Constructor & Destructor Documentation

6.288.1.1 decaf::lang::Double::Double (double *value*)

Parameters:

value - the primitve type to wrap

6.288.1.2 decaf::lang::Double::Double (const std::string & *value*) throw (exceptions::NumberFormatException)

Parameters:

value - the string to convert to a primitve type to wrap

6.288.1.3 virtual decaf::lang::Double::~Double () [inline, virtual]

6.288.2 Member Function Documentation

6.288.2.1 virtual unsigned char decaf::lang::Double::byteValue () const [inline, virtual]

Answers the byte value which the receiver represents.

Returns:

byte the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2432).

6.288.2.2 static int decaf::lang::Double::compare (double *d1*, double *d2*) [static]

Compares the two specified double values. The sign of the integer value returned is the same as that of the integer that would be returned by the call: new Double(d1).compareTo(new Double(d2))

Parameters:

d1 - the first double to compare

d2 - the second double to compare

Returns:

the value 0 if d1 is numerically equal to d2; a value less than 0 if d1 is numerically less than d2; and a value greater than 0 if d1 is numerically greater than d2.

6.288.2.3 virtual int decaf::lang::Double::compareTo (const double & *d*) const [virtual]

Compares this **Double** (p. 1537) instance with another.

Parameters:

d - the **Double** (p. 1537) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object repesents a value less than the passed in value.

Implements **decaf::lang::Comparable< double >** (p. 1083).

6.288.2.4 virtual int decaf::lang::Double::compareTo (const Double & *d*) const [virtual]

Compares this **Double** (p. 1537) instance with another.

Parameters:

d - the **Double** (p. 1537) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object repesents a value less than the passed in value.

Implements **decaf::lang::Comparable< Double >** (p. 1083).

6.288.2.5 static long long decaf::lang::Double::doubleToLongBits (double *value*) [static]

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout. Bit 63 (the bit that is selected by the mask 0x8000000000000000L) represents the sign of the floating-point number. Bits 62-52 (the bits that are selected by the mask 0x7ff0000000000000L) represent the exponent. Bits 51-0 (the bits that are selected by the mask 0x000fffffffffffffL) represent the significand (sometimes called the mantissa) of the floating-point number.

If the argument is positive infinity, the result is 0x7ff0000000000000L. If the argument is negative infinity, the result is 0xfff0000000000000L. If the argument is NaN, the result is 0x7ff8000000000000L.

In all cases, the result is a long integer that, when given to the longBitsToDouble(long) method, will produce a floating-point value the same as the argument to doubleToLongBits (except all NaN values are collapsed to a single "canonical" NaN value).

Parameters:

value - double to be converted

Returns:

the long long bits that make up the double

6.288.2.6 static long long decaf::lang::Double::doubleToRawLongBits (double *value*) [static]

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout, preserving Not-a-Number (NaN) values. Bit 63 (the bit that is selected by the mask 0x8000000000000000LL) represents the sign of the floating-point number. Bits 62-52 (the bits that are selected by the mask 0x7ff0000000000000L) represent the exponent. Bits 51-0 (the bits that are selected by the mask 0x000fffffffffffffL) represent the significand (sometimes called the mantissa) of the floating-point number.

If the argument is positive infinity, the result is 0x7ff0000000000000LL. If the argument is negative infinity, the result is 0xfff0000000000000LL. If the argument is NaN, the result is the long integer representing the actual NaN value. Unlike the doubleToLongBits method, doubleToRawLongBits does not collapse all the bit patterns encoding a NaN to a single "canonical" NaN value.

In all cases, the result is a long integer that, when given to the longBitsToDouble(long) method, will produce a floating-point value the same as the argument to doubleToRawLongBits.

Parameters:

value - double to be converted

Returns:

the long long bits that make up the double

6.288.2.7 virtual double decaf::lang::Double::doubleValue () const [inline, virtual]

Answers the double value which the receiver represents.

Returns:

double the value of the receiver.

Implements **decaf::lang::Number** (p. 2433).

6.288.2.8 bool decaf::lang::Double::equals (const double & *d*) const [inline, virtual]

Parameters:

d - the **Double** (p. 1537) object to compare against.

Returns:

true if the two **Double** (p. 1537) Objects have the same value.

Implements **decaf::lang::Comparable< double >** (p. 1084).

6.288.2.9 bool decaf::lang::Double::equals (const Double & *d*) const [inline, virtual]

Parameters:

d - the **Double** (p. 1537) object to compare against.

Returns:

true if the two **Double** (p. 1537) Objects have the same value.

Implements **decaf::lang::Comparable< Double >** (p. 1084).

6.288.2.10 virtual float decaf::lang::Double::floatValue () const [inline, virtual]

Answers the float value which the receiver represents.

Returns:

float the value of the receiver.

Implements **decaf::lang::Number** (p. 2433).

6.288.2.11 virtual int decaf::lang::Double::intValue () const [inline, virtual]

Answers the int value which the receiver represents.

Returns:

int the value of the receiver.

Implements **decaf::lang::Number** (p. 2433).

6.288.2.12 static bool decaf::lang::Double::isInfinite (double *value*) [static]

Parameters:

value - The double to check.

Returns:

true if the double is equal to infinity.

6.288.2.13 bool decaf::lang::Double::isInfinite () const

Returns:

true if the double is equal to positive infinity.

6.288.2.14 static bool decaf::lang::Double::isNaN (double *value*) [static]

Parameters:

value - The double to check.

Returns:

true if the double is equal to NaN.

6.288.2.15 bool decaf::lang::Double::isNaN () const

Returns:

true if the double is equal to NaN.

6.288.2.16 static double decaf::lang::Double::longBitsToDouble (long long *bits*) [static]

Returns the double value corresponding to a given bit representation. The argument is considered to be a representation of a floating-point value according to the IEEE 754 floating-point "double format" bit layout.

If the argument is 0x7ff0000000000000L, the result is positive infinity. If the argument is 0xfff0000000000000L, the result is negative infinity. If the argument is any value in the range 0x7ff0000000000001L through 0x7fffffffffffffffL or in the range 0xfff0000000000001L through 0xffffffffffffffffL, the result is a NaN. No IEEE 754 floating-point operation provided by C++ can distinguish between two NaN values of the same type with different bit patterns. Distinct values of NaN are only distinguishable by use of the **Double.doubleToRawLongBits** (p. 1541) method.

Parameters:

bits - the long long bits to convert to double

Returns:

the double converted from the bits

6.288.2.17 virtual long long decaf::lang::Double::longValue () const [inline, virtual]

Answers the long value which the receiver represents.

Returns:

long the value of the receiver.

Implements **decaf::lang::Number** (p. 2433).

6.288.2.18 virtual bool decaf::lang::Double::operator< (const double & *d*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

d - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< double >** (p. 1084).

6.288.2.19 virtual bool decaf::lang::Double::operator< (const Double & *d*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

d - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Double >** (p. 1084).

6.288.2.20 virtual bool decaf::lang::Double::operator== (const double & *d*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

d - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< double >** (p. 1085).

6.288.2.21 virtual bool decaf::lang::Double::operator== (const Double & *d*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

d - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Double >** (p. 1085).

6.288.2.22 static double decaf::lang::Double::parseDouble (const std::string *value*) throw (exceptions::NumberFormatException) [static]

Returns a new double initialized to the value represented by the specified string, as performed by the valueOf method of class **Double** (p. 1537).

Parameters:

value - The string to parse to an double

Returns:

a double parsed from the passed string

Exceptions:

NumberFormatException

6.288.2.23 virtual short decaf::lang::Double::shortValue () const [inline, virtual]

Answers the short value which the receiver represents.

Returns:

short the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2434).

6.288.2.24 static std::string decaf::lang::Double::toHexString (double *value*) [static]

Returns a hexadecimal string representation of the double argument. All characters mentioned below are ASCII characters.

∗ If the argument is NaN, the result is the string "NaN". ∗ Otherwise, the result is a string that represents the sign and magnitude (absolute value) of the argument. If the sign is negative, the first character of the result is '-'; if the sign is positive, no sign character appears in the result. As for the magnitude m: o If m is infinity, it is represented by the string "Infinity"; thus, positive infinity produces the result "Infinity" and negative infinity produces the result "-Infinity". o If m is zero, it is represented by the string "0x0.0p0"; thus, negative zero produces the result "-0x0.0p0" and positive zero produces the result "0x0.0p0". o If m is a double value with a normalized representation, substrings are used to represent the significand and exponent fields. The significand is represented by the characters "0x1." followed by a lowercase hexadecimal representation of the rest of the significand as a fraction. Trailing zeros in the hexadecimal representation are removed unless all the digits are zero, in which case a single zero is used. Next, the exponent is represented by "p" followed by a decimal string of the unbiased exponent as if produced by a call to **Integer.toString** (p. 1774) on the exponent value. o If m is a double value with a subnormal representation, the significand is represented by the characters "0x0." followed

by a hexadecimal representation of the rest of the significand as a fraction. Trailing zeros in the hexadecimal representation are removed. Next, the exponent is represented by "p-126". Note that there must be at least one nonzero digit in a subnormal significand.

Parameters:

value - The double to convert to a string

Returns:

the Hex formatted double string.

6.288.2.25 static std::string decaf::lang::Double::toString (double *value*) [static]

Returns a string representation of the double argument. All characters mentioned below are ASCII characters.

If the argument is NaN, the result is the string "NaN". Otherwise, the result is a string that represents the sign and magnitude (absolute value) of the argument. If the sign is negative, the first character of the result is '-'; if the sign is positive, no sign character appears in the result. As for the magnitude m: o If m is infinity, it is represented by the characters "Infinity"; thus, positive infinity produces the result "Infinity" and negative infinity produces the result "-Infinity". o If m is zero, it is represented by the characters "0.0"; thus, negative zero produces the result "-0.0" and positive zero produces the result "0.0". o If m is greater than or equal to 10-3 but less than 107, then it is represented as the integer part of m, in decimal form with no leading zeroes, followed by '.', followed by one or more decimal digits representing the fractional part of m. o If m is less than 10-3 or greater than or equal to 107, then it is represented in so-called "computerized scientific notation." Let n be the unique integer such that 10n <= m < 10n+1; then let a be the mathematically exact quotient of m and 10n so that 1 <= a < 10. The magnitude is then represented as the integer part of a, as a single decimal digit, followed by '.', followed by decimal digits representing the fractional part of a, followed by the letter 'E', followed by a representation of n as a decimal integer, as produced by the method **Integer.toString(int)** (p. 1774).

Parameters:

value - The double to convert to a string

Returns:

the formatted double string.

6.288.2.26 std::string decaf::lang::Double::toString () const

Returns:

this **Double** (p. 1537) Object as a String Representation

6.288.2.27 static Double decaf::lang::Double::valueOf (const std::string & *value*) throw (exceptions::NumberFormatException) [static]

Returns a **Double** (p. 1537) instance that wraps a primtive double which is parsed from the string value passed.

Parameters:

value - the string to parse

Returns:

a new **Double** (p. 1537) instance wrapping the double parsed from value

Exceptions:

NumberFormatException on error.

6.288.2.28 static Double decaf::lang::Double::valueOf (double *value*) [static]

Returns a **Double** (p. 1537) instance representing the specified double value.

Parameters:

value - double to wrap

Returns:

new **Double** (p. 1537) instance wrapping the primitive value

6.288.3 Field Documentation

6.288.3.1 const double decaf::lang::Double::MAX_VALUE [static]

The maximum value that the primitive type can hold.

6.288.3.2 const double decaf::lang::Double::MIN_VALUE [static]

The minimum value that the primitive type can hold.

6.288.3.3 const double decaf::lang::Double::NaN [static]

Constant for the Not a **Number** (p. 2432) Value.

6.288.3.4 const double decaf::lang::Double::NEGATIVE_INFINITY [static]

Constant for Negative Infinitiy.

6.288.3.5 const double decaf::lang::Double::POSITIVE_INFINITY [static]

Constant for Positive Infinity.

6.288.3.6 const int decaf::lang::Double::SIZE = 64 [static]

The size in bits of the primitive int type.

The documentation for this class was generated from the following file:

6.289 decaf::internal::nio::DoubleArrayBuffer Class Reference

`#include <src/main/decaf/internal/nio/DoubleArrayBuffer.h>`Inheritance diagram for decaf::internal::nio::DoubleArrayBuffer:

Public Member Functions

- **DoubleArrayBuffer** (std::size_t capacity, bool readOnly=false)

  *Creates a **DoubleArrayBuffer** (p. 1548) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

- **DoubleArrayBuffer** (double *array, std::size_t offset, std::size_t capacity, bool readOnly=false) throw (decaf::lang::exceptions::NullPointerException)

  *Creates a **DoubleArrayBuffer** (p. 1548) object that wraps the given array.*

- **DoubleArrayBuffer** (**ByteArrayPerspective** &array, std::size_t offset, std::size_t length, bool readOnly=false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

  *Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 908) and start at the given offset.*

- **DoubleArrayBuffer** (const **DoubleArrayBuffer** &other)

  *Create a **DoubleArrayBuffer** (p. 1548) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 908) and when changes are made to that data it is reflected in both.*

- virtual ~**DoubleArrayBuffer** ()
- virtual double * **array** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)

  Returns the double array that backs this buffer (optional operation).

- virtual std::size_t **arrayOffset** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

- virtual DoubleBuffer * **asReadOnlyBuffer** () const

  Creates a new, read-only double buffer that shares this buffer's content.

- virtual DoubleBuffer & **compact** () throw (decaf::nio::ReadOnlyBufferException)

  Compacts this buffer.

- virtual DoubleBuffer * **duplicate** ()

  Creates a new double buffer that shares this buffer's content.

- virtual double **get** () throw (decaf::nio::BufferUnderflowException)

  Relative get method.

- virtual double **get** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)

  Absolute get method.

- virtual bool **hasArray** () const

  Tells whether or not this buffer is backed by an accessible double array.

- virtual bool **isReadOnly** () const

  Tells whether or not this buffer is read-only.

- virtual DoubleBuffer & **put** (double value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

  Writes the given doubles into this buffer at the current position, and then increments the position.

- virtual DoubleBuffer & **put** (std::size_t index, double value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)

  Writes the given doubles into this buffer at the given index.

- virtual DoubleBuffer * **slice** () const

  Creates a new DoubleBuffer whose content is a shared subsequence of this buffer's content.

Protected Member Functions

- virtual void **setReadOnly** (bool value)

  *Sets this **ByteArrayBuffer** (p. 870) as Read-Only.*

6.289.1 Constructor & Destructor Documentation

6.289.1.1 decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer (std::size_t *capacity*, bool *readOnly* = `false`)

Creates a **DoubleArrayBuffer** (p. 1548) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

6.289.1.2 decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer (double * *array*, std::size_t *offset*, std::size_t *capacity*, bool *readOnly* = `false`) throw (decaf::lang::exceptions::NullPointerException)

Creates a **DoubleArrayBuffer** (p. 1548) object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

offset - the position that is this buffers start pos.

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

Exceptions:

NullPointerException if buffer is NULL

6.289.1.3 decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer (ByteArrayPerspective & *array*, std::size_t *offset*, std::size_t *length*, bool *readOnly* = `false`) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 908) and start at the given offset. The capacity and limit of the new **DoubleArrayBuffer** (p. 1548) will be that of the remaining capacity of the passed buffer.

Parameters:

array - the **ByteArrayPerspective** (p. 908) to wrap

offset - the offset into array where the buffer starts

length - the length of the array we are wrapping or limit.

readOnly - is this a readOnly buffer.

Exceptions:

IndexOutOfBoundsException if offset is greater than array capacity.

6.289.1.4 decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer (const DoubleArrayBuffer & *other*)

Create a **DoubleArrayBuffer** (p. 1548) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 908) and when changes are made to that data it is reflected in both.

Parameters:

other - the **DoubleArrayBuffer** (p. 1548) this one is to mirror.

6.289.1.5 virtual decaf::internal::nio::DoubleArrayBuffer::~DoubleArrayBuffer () `[virtual]`

6.289.2 Member Function Documentation

6.289.2.1 virtual double* decaf::internal::nio::DoubleArrayBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) `[virtual]`

Returns the double array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this Buffer

Exceptions:

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::DoubleBuffer** (p. 1559).

6.289.2.2 virtual std::size_t decaf::internal::nio::DoubleArrayBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::DoubleBuffer** (p. 1559).

6.289.2.3 virtual DoubleBuffer* decaf::internal::nio::DoubleArrayBuffer::asReadOnlyBuffer () const [virtual]

Creates a new, read-only double buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only double buffer which the caller then owns.

Implements **decaf::nio::DoubleBuffer** (p. 1559).

6.289.2.4 virtual DoubleBuffer& decaf::internal::nio::DoubleArrayBuffer::compact () throw (decaf::nio::ReadOnlyBufferException) [virtual]

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 807) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 807) - 1 is copied to index n = **limit()** (p. 807) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this DoubleBuffer

Exceptions:

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::DoubleBuffer** (p. 1560).

6.289.2.5 virtual DoubleBuffer* decaf::internal::nio::DoubleArrayBuffer::duplicate () [virtual]

Creates a new double buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new double Buffer which the caller owns.

Implements **decaf::nio::DoubleBuffer** (p. 1560).

6.289.2.6 virtual double decaf::internal::nio::DoubleArrayBuffer::get (std::size_t *index*) const throw (lang::exceptions::IndexOutOfBoundsException) [virtual]

Absolute get method. Reads the value at the given index.

Parameters:

index - the index in the Buffer where the double is to be read

Returns:

the double that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implements **decaf::nio::DoubleBuffer** (p. 1562).

6.289.2.7 virtual double decaf::internal::nio::DoubleArrayBuffer::get () throw (decaf::nio::BufferUnderflowException) [virtual]

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the double at the current position

Exceptions:

BufferUnderflowException if there no more data to return

Implements **decaf::nio::DoubleBuffer** (p. 1562).

6.289.2.8 virtual bool decaf::internal::nio::DoubleArrayBuffer::hasArray () const [inline, virtual]

Tells whether or not this buffer is backed by an accessible double array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implements **decaf::nio::DoubleBuffer** (p. 1562).

6.289.2.9 virtual bool decaf::internal::nio::DoubleArrayBuffer::isReadOnly () const [inline, virtual]

Tells whether or not this buffer is read-only.

Returns:

true if, and only if, this buffer is read-only

Implements **decaf::nio::Buffer** (p. 806).

6.289.2.10 virtual DoubleBuffer& decaf::internal::nio::DoubleArrayBuffer::put (std::size_t *index*, double *value*) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException) [virtual]

Writes the given doubles into this buffer at the given index.

Parameters:

index - position in the Buffer to write the data

value - the doubles to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::DoubleBuffer** (p. 1563).

6.289.2.11 virtual DoubleBuffer& decaf::internal::nio::DoubleArrayBuffer::put (double *value*) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException) [virtual]

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters:

value - the doubles value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::DoubleBuffer** (p. 1563).

6.289.2.12 virtual void decaf::internal::nio::DoubleArrayBuffer::setReadOnly (bool *value*) [inline, protected, virtual]

Sets this **ByteArrayBuffer** (p. 870) as Read-Only.

Parameters:

value - true if this buffer is to be read-only.

6.289.2.13 virtual DoubleBuffer* decaf::internal::nio::DoubleArrayBuffer::slice () const [virtual]

Creates a new DoubleBuffer whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create DoubleBuffer which the caller owns.

Implements **decaf::nio::DoubleBuffer** (p. 1565).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/nio/**DoubleArrayBuffer.h**

6.290 decaf::nio::DoubleBuffer Class Reference

This class defines four categories of operations upon double buffers:.

`#include <src/main/decaf/nio/DoubleBuffer.h>`Inheritance diagram for decaf::nio::DoubleBuffer:

Public Member Functions

- virtual ~**DoubleBuffer** ()
- virtual std::string **toString** () const
- virtual double * **array** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)

  Returns the double array that backs this buffer (optional operation).

- virtual std::size_t **arrayOffset** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

- virtual **DoubleBuffer** * **asReadOnlyBuffer** () const =0

  Creates a new, read-only double buffer that shares this buffer's content.

- virtual **DoubleBuffer** & **compact** ()=0 throw (ReadOnlyBufferException)

  Compacts this buffer.

- virtual **DoubleBuffer** * **duplicate** ()=0

  Creates a new double buffer that shares this buffer's content.

- virtual double **get** ()=0 throw (BufferUnderflowException)

  Relative get method.

- virtual double **get** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)

  Absolute get method.

- **DoubleBuffer** & **get** (std::vector< double > buffer) throw (BufferUnderflowException)

  Relative bulk get method.

- **DoubleBuffer** & **get** (double *buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)

  Relative bulk get method.

- virtual bool **hasArray** () const =0

  Tells whether or not this buffer is backed by an accessible double array.

- **DoubleBuffer** & **put** (**DoubleBuffer** &src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)

  This method transfers the doubles remaining in the given source buffer into this buffer.

- **DoubleBuffer** & **put** (const double *buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)

  This method transfers doubles into this buffer from the given source array.

- **DoubleBuffer** & **put** (std::vector< double > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)

  This method transfers the entire content of the given source doubles array into this buffer.

- virtual **DoubleBuffer** & **put** (double value)=0 throw (BufferOverflowException, ReadOnlyBufferException)

  Writes the given doubles into this buffer at the current position, and then increments the position.

- virtual **DoubleBuffer** & **put** (std::size_t index, double value)=0 throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)

  Writes the given doubles into this buffer at the given index.

- virtual **DoubleBuffer** * **slice** () const =0

  *Creates a new **DoubleBuffer** (p. 1556) whose content is a shared subsequence of this buffer's content.*

- virtual int **compareTo** (const **DoubleBuffer** &value) const

  Compares this object with the specified object for order.

- virtual bool **equals** (const **DoubleBuffer** &value) const
- virtual bool **operator==** (const **DoubleBuffer** &value) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const **DoubleBuffer** &value) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

Static Public Member Functions

- static **DoubleBuffer** * **allocate** (std::size_t capacity)

  Allocates a new Double buffer.

- static **DoubleBuffer** * **wrap** (double *array, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)

  *Wraps the passed buffer with a new **DoubleBuffer** (p. 1556).*

- static **DoubleBuffer** * **wrap** (std::vector< double > &buffer)

  *Wraps the passed STL double Vector in a **DoubleBuffer** (p. 1556).*

Protected Member Functions

- **DoubleBuffer** (std::size_t capacity)

  *Creates a **DoubleBuffer** (p. 1556) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.290.1 Detailed Description

This class defines four categories of operations upon double buffers:. o Absolute and relative get and put methods that read and write single doubles; o Relative bulk get methods that transfer contiguous sequences of doubles from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of doubles from a double array or some other double buffer into this buffer o Methods for compacting, duplicating, and slicing a double buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing double array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.290.2 Constructor & Destructor Documentation

6.290.2.1 decaf::nio::DoubleBuffer::DoubleBuffer (std::size_t *capacity*) [protected]

Creates a **DoubleBuffer** (p. 1556) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size and limit of the **Buffer** (p. 803) in doubles

6.290.2.2 virtual decaf::nio::DoubleBuffer::~DoubleBuffer () [inline, virtual]

6.290.3 Member Function Documentation

6.290.3.1 static DoubleBuffer* decaf::nio::DoubleBuffer::allocate (std::size_t *capacity*) [static]

Allocates a new Double buffer. The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters:

capacity - The size of the Double buffer in doubles

Returns:

the **DoubleBuffer** (p. 1556) that was allocated, caller owns.

6.290.3.2 virtual double* decaf::nio::DoubleBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]

Returns the double array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this **Buffer** (p. 803)

Exceptions:

ReadOnlyBufferException *(p. 2685)* if this **Buffer** (p. 803) is read only.
UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1550).

6.290.3.3 virtual std::size_t decaf::nio::DoubleBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException *(p. 2685)* if this **Buffer** (p. 803) is read only.
UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1551).

6.290.3.4 virtual DoubleBuffer* decaf::nio::DoubleBuffer::asReadOnlyBuffer () const [pure virtual]

Creates a new, read-only double buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only double buffer which the caller then owns.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1551).

6.290.3.5 virtual DoubleBuffer& decaf::nio::DoubleBuffer::compact () throw (ReadOnlyBufferException) [pure virtual]

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 807) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 807) - 1 is copied to index n = **limit()** (p. 807) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **DoubleBuffer** (p. 1556)

Exceptions:

ReadOnlyBufferException *(p. **2685**)* - If this buffer is read-only

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1552).

6.290.3.6 virtual int decaf::nio::DoubleBuffer::compareTo (const DoubleBuffer & *value*) const [virtual]

Compares this object with the specified object for order. Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Parameters:

value - the Object to be compared.

Returns:

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

6.290.3.7 virtual DoubleBuffer* decaf::nio::DoubleBuffer::duplicate () [pure virtual]

Creates a new double buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new double **Buffer** (p. 803) which the caller owns.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1552).

6.290.3.8 virtual bool decaf::nio::DoubleBuffer::equals (const DoubleBuffer & *value*) const [virtual]

Returns:

true if this value is considered equal to the passed value.

6.290.3.9 DoubleBuffer& decaf::nio::DoubleBuffer::get (double * *buffer*, std::size_t *offset*, std::size_t *length*) throw (BufferUnderflowException, lang::exceptions::NullPointerException)

Relative bulk get method. This method transfers doubles from this buffer into the given destination array. If there are fewer doubles remaining in the buffer than are required to satisfy the request, that is, if length > **remaining()** (p. 808), then no bytes are transferred and a **BufferUnderflowException** (p. 837) is thrown.

Otherwise, this method copies length doubles from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters:

buffer - pointer to an allocated buffer to fill

offset - position in the buffer to start filling

length - amount of data to put in the passed buffer

Returns:

a reference to this **Buffer** (p. 803)

Exceptions:

BufferUnderflowException *(p. 837)* - If there are fewer than length doubles remaining in this buffer

NullPointerException if the passed buffer is null.

6.290.3.10 DoubleBuffer& decaf::nio::DoubleBuffer::get (std::vector< double > *buffer*) throw (BufferUnderflowException)

Relative bulk get method. This method transfers values from this buffer into the given destination vector. An invocation of this method of the form src.get(a) behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call buffer.resize(N) before calling this get method.

Returns:

a reference to this **Buffer** (p. 803)

Exceptions:

BufferUnderflowException *(p. 837)* - If there are fewer than length doubles remaining in this buffer

6.290.3.11 virtual double decaf::nio::DoubleBuffer::get (std::size_t *index*) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Absolute get method. Reads the value at the given index.

Parameters:

index - the index in the **Buffer** (p. 803) where the double is to be read

Returns:

the double that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1552).

6.290.3.12 virtual double decaf::nio::DoubleBuffer::get () throw (BufferUnderflowException) [pure virtual]

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the double at the current position

Exceptions:

BufferUnderflowException *(p. 837)* if there no more data to return

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1553).

6.290.3.13 virtual bool decaf::nio::DoubleBuffer::hasArray () const [pure virtual]

Tells whether or not this buffer is backed by an accessible double array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1553).

6.290.3.14 virtual bool decaf::nio::DoubleBuffer::operator< (const DoubleBuffer & *value*) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.290.3.15 virtual bool decaf::nio::DoubleBuffer::operator== (const DoubleBuffer & *value*) const [virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.290.3.16 virtual DoubleBuffer& decaf::nio::DoubleBuffer::put (std::size_t *index*, double *value*) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException) [pure virtual]

Writes the given doubles into this buffer at the given index.

Parameters:

index - position in the **Buffer** (p. 803) to write the data

value - the doubles to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. ***2685***) - If this buffer is read-only

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1553).

6.290.3.17 virtual DoubleBuffer& decaf::nio::DoubleBuffer::put (double *value*) throw (BufferOverflowException, ReadOnlyBufferException) [pure virtual]

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters:

value - the doubles value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException *(p. 834)* - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException *(p. 2685)* - If this buffer is read-only

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1554).

6.290.3.18 DoubleBuffer& decaf::nio::DoubleBuffer::put (std::vector< double > & *buffer*) throw (BufferOverflowException, ReadOnlyBufferException)

This method transfers the entire content of the given source doubles array into this buffer. This is the same as calling put(&buffer[0], 0, buffer.size()

Parameters:

buffer - The buffer whose contents are copied to this **DoubleBuffer** (p. 1556)

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException *(p. 834)* - If there is insufficient space in this buffer

ReadOnlyBufferException *(p. 2685)* - If this buffer is read-only

6.290.3.19 DoubleBuffer& decaf::nio::DoubleBuffer::put (const double * *buffer*, std::size_t *offset*, std::size_t *length*) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)

This method transfers doubles into this buffer from the given source array. If there are more doubles to be copied from the array than remain in this buffer, that is, if length > **remaining()** (p. 808), then no doubles are transferred and a **BufferOverflowException** (p. 834) is thrown.

Otherwise, this method copies length bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by length.

Parameters:

buffer- The array from which doubles are to be read

offset- The offset within the array of the first double to be read;

length - The number of doubles to be read from the given array

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException *(p. 834)* - If there is insufficient space in this buffer

ReadOnlyBufferException *(p. 2685)* - If this buffer is read-only

NullPointerException if the passed buffer is null.

6.290.3.20 DoubleBuffer& decaf::nio::DoubleBuffer::put (DoubleBuffer & *src*) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)

This method transfers the doubles remaining in the given source buffer into this buffer. If there are more doubles remaining in the source buffer than in this buffer, that is, if src.remaining() > **remaining()** (p. 808), then no doubles are transferred and a **BufferOverflowException** (p. 834) is thrown.

Otherwise, this method copies n = src.remaining() doubles from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by n.

Parameters:

src - the buffer to take doubles from an place in this one.

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException *(p. 834)* - If there is insufficient space in this buffer for the remaining doubles in the source buffer

IllegalArgumentException - If the source buffer is this buffer

ReadOnlyBufferException *(p. 2685)* - If this buffer is read-only

6.290.3.21 virtual DoubleBuffer* decaf::nio::DoubleBuffer::slice () const [pure virtual]

Creates a new **DoubleBuffer** (p. 1556) whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **DoubleBuffer** (p. 1556) which the caller owns.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1554).

6.290.3.22 virtual std::string decaf::nio::DoubleBuffer::toString () const [virtual]

Returns:

a std::string describing this object

6.290.3.23 static DoubleBuffer* decaf::nio::DoubleBuffer::wrap (std::vector< double > & *buffer*) [static]

Wraps the passed STL double Vector in a **DoubleBuffer** (p. 1556). The new buffer will be backed by the given double array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns:

a new **DoubleBuffer** (p. 1556) that is backed by buffer, caller owns.

6.290.3.24 static DoubleBuffer* decaf::nio::DoubleBuffer::wrap (double * *array*, std::size_t *offset*, std::size_t *length*) throw (lang::exceptions::NullPointerException) [static]

Wraps the passed buffer with a new **DoubleBuffer** (p. 1556). The new buffer will be backed by the given double array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

array - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns:

a new **DoubleBuffer** (p. 1556) that is backed by buffer, caller owns.

6.292 activemq::cmsutil::DynamicDestinationResolver Class Reference

Resolves a CMS destination name to a `Destination`.

`#include <src/main/activemq/cmsutil/DynamicDestinationResolver.h>`Inheritance diagram for activemq::cmsutil::DynamicDestinationResolver:

Data Structures

- class **SessionResolver**

  Manages maps of names to topics and queues for a single session.

Public Member Functions

- virtual ~**DynamicDestinationResolver** ()
- virtual void **init** (**ResourceLifecycleManager** *mgr)

  Initializes this destination resolver for use.

- virtual void **destroy** ()

  Destroys any allocated resources.

- virtual **cms::Destination** * **resolveDestinationName** (**cms::Session** *session, const std::string &destName, bool pubSubDomain) throw (cms::CMSException)

  Resolves the given name to a destination.

6.292.1 Detailed Description

Resolves a CMS destination name to a `Destination`.

6.292.2 Constructor & Destructor Documentation

6.292.2.1 virtual activemq::cmsutil::DynamicDestinationResolver::~DynamicDestinationResolver () [virtual]

6.292.3 Member Function Documentation

6.292.3.1 virtual void activemq::cmsutil::DynamicDestinationResolver::destroy () [virtual]

Destroys any allocated resources.

Implements **activemq::cmsutil::DestinationResolver** (p. 1509).

6.292.3.2 virtual void activemq::cmsutil::DynamicDestinationResolver::init (ResourceLifecycleManager * *mgr*) [inline, virtual]

Initializes this destination resolver for use. Ensures that any previously allocated resources are first destroyed (e.g. calls **destroy()** (p. 1568)).

Parameters:

mgr the resource lifecycle manager.

Implements **activemq::cmsutil::DestinationResolver** (p. 1509).

6.292.3.3 virtual cms::Destination* activemq::cmsutil::DynamicDestinationResolver::resolveDestinationName (cms::Session * *session*, const std::string & *destName*, bool *pubSubDomain*) throw (cms::CMSException) [virtual]

Resolves the given name to a destination. If `pubSubDomain` is true, a topic will be returned, otherwise a queue will be returned.

Parameters:

session the session for which to retrieve resolve the destination.

destName the name to be resolved.

pubSubDomain If true, the name will be resolved to a Topic, otherwise a Queue.

Returns:

the resolved destination

Exceptions:

cms::CMSException *(*p. ***1031)*** if resolution failed.

Implements **activemq::cmsutil::DestinationResolver** (p. 1510).

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**DynamicDestinationResolver.h**

6.293 decaf::util::Map< K, V, COMPARATOR >::Entry Class Reference

6.294 decaf::io::EOFException Class Reference

`#include <src/main/decaf/io/EOFException.h>`Inheritance diagram for decaf::io::EOFException:

Public Member Functions

- **EOFException** () throw ()

  Default Constructor.

- **EOFException** (const **lang::Exception** &ex) throw ()

  Copy Constructor.

- **EOFException** (const **EOFException** &ex) throw ()

  Copy Constructor.

- **EOFException** (const char *file, const int lineNumber, const std::exception ***cause**, const char *msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.

- **EOFException** (const std::exception ***cause**) throw ()

  Constructor.

- **EOFException** (const char *file, const int lineNumber, const char *msg,...) throw ()

  Constructor.

- virtual **EOFException** * **clone** () const

  Clones this exception.

- virtual ~**EOFException** () throw ()

6.294.1 Constructor & Destructor Documentation

6.294.1.1 decaf::io::EOFException::EOFException () throw () `[inline]`

Default Constructor.

6.294.1.2 decaf::io::EOFException::EOFException (const lang::Exception & *ex*) throw () `[inline]`

Copy Constructor.

Parameters:

ex the exception to copy

6.294.1.3 decaf::io::EOFException::EOFException (const EOFException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex the exception to copy, which is an instance of this type

6.294.1.4 decaf::io::EOFException::EOFException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.294.1.5 decaf::io::EOFException::EOFException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.294.1.6 decaf::io::EOFException::EOFException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.294.1.7 virtual decaf::io::EOFException::~EOFException () throw () [inline, virtual]

6.294.2 Member Function Documentation

6.294.2.1 virtual EOFException* decaf::io::EOFException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new instance of an Exception that is a copy of this one.

Reimplemented from **decaf::io::IOException** (p. 1822).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**EOFException.h**

6.295 decaf::lang::Exception Class Reference

`#include <src/main/decaf/lang/Exception.h>`Inheritance diagram for decaf::lang::Exception:

Public Member Functions

- **Exception** () throw ()

  Default Constructor.

- **Exception** (const **Exception** &ex) throw ()

  Copy Constructor.

- **Exception** (const std::exception ∗**cause**) throw ()

  Constructor.

- **Exception** (const char ∗file, const int lineNumber, const char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.

- **Exception** (const char ∗file, const int lineNumber, const std::exception ∗**cause**, const char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.

- virtual ∼**Exception** () throw ()
- virtual std::string **getMessage** () const

  Gets the message for this exception.

- virtual const std::exception ∗ **getCause** () const

  Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.

- virtual void **initCause** (const std::exception ∗**cause**)

  Initializes the contained cause exception with the one given.

- virtual const char ∗ **what** () const throw ()

  Implement method from std::exception.

- virtual void **setMessage** (const char ∗msg,...)

  Sets the cause for this exception.

- virtual void **setMark** (const char ∗file, const int lineNumber)

  Adds a file/line number to the stack trace.

- virtual **Exception** ∗ **clone** () const

  Clones this exception.

- virtual std::vector< std::pair< std::string, int > > **getStackTrace** () const

  Provides the stack trace for every point where this exception was caught, marked, and rethrown.

- virtual void **printStackTrace** () const

  Prints the stack trace to std::err.

- virtual void **printStackTrace** (std::ostream &stream) const

  Prints the stack trace to the given output stream.

- virtual std::string **getStackTraceString** () const

  Gets the stack trace as one contiguous string.

- virtual **Exception** & **operator=** (const **Exception** &ex)

  Assignment operator.

Protected Member Functions

- virtual void **setStackTrace** (const std::vector< std::pair< std::string, int > > &trace)
- virtual void **buildMessage** (const char *format, va_list &vargs)

Protected Attributes

- std::string **message**

  The cause of this exception.

- std::exception * **cause**

  *The **Exception** (p. 1574) that caused this one to be thrown.*

- std::vector< std::pair< std::string, int > > **stackTrace**

  The stack trace.

6.295.1 Constructor & Destructor Documentation

6.295.1.1 decaf::lang::Exception::Exception () throw ()

Default Constructor.

Referenced by decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException(), decaf::util::concurrent::CancellationException::CancellationException(), decaf::util::concurrent::ExecutionException::ExecutionException(), decaf::net::HttpRetryException::HttpRetryException(), decaf::net::MalformedURLException::MalformedURLException(), decaf::net::ProtocolException::ProtocolException(), decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException(), decaf::net::SocketTimeoutException::SocketTimeoutException(), decaf::util::concurrent::TimeoutException::TimeoutException(), decaf::net::UnknownHostException::UnknownHostException(), and decaf::net::UnknownServiceException::UnknownServiceException().

6.295.1.2 decaf::lang::Exception::Exception (const Exception & *ex*) throw ()

Copy Constructor.

Parameters:

ex The `Exception` (p. 1574) instance to copy.

6.295.1.3 decaf::lang::Exception::Exception (const std::exception * *cause*) throw ()

Constructor.

Parameters:

cause **Pointer** (p. 2497) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.295.1.4 decaf::lang::Exception::Exception (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw ()

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.295.1.5 decaf::lang::Exception::Exception (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw ()

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.295.1.6 virtual decaf::lang::Exception::~Exception () throw () [virtual]

6.295.2 Member Function Documentation

6.295.2.1 virtual void decaf::lang::Exception::buildMessage (const char * *format*, va_list & *vargs*) [protected, virtual]

Referenced by decaf::lang::exceptions::NumberFormatException::NumberFormatException().

6.295.2.2 virtual Exception* decaf::lang::Exception::clone () const [virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

Copy of this **Exception** (p. 1574) object

Implements **decaf::lang::Throwable** (p. 3182).

Reimplemented in **activemq::exceptions::ActiveMQException** (p. 306), **activemq::exceptions::BrokerException** (p. 749), **decaf::io::EOFException** (p. 1573), **decaf::io::InterruptedIOException** (p. 1807), **decaf::io::IOException** (p. 1822), **decaf::io::UnsupportedEncodingException** (p. 3302), **decaf::io::UTFDataFormatException** (p. 3355), **decaf::lang::exceptions::ClassCastException** (p. 1018), **decaf::lang::exceptions::IllegalArgumentException** (p. 1722), **decaf::lang::exceptions::IllegalMonitorStateException** (p. 1725), **decaf::lang::exceptions::IllegalStateException** (p. 1728), **decaf::lang::exceptions::IllegalThreadStateException** (p. 1732), **decaf::lang::exceptions::IndexOutOfBoundsException** (p. 1739), **decaf::lang::exceptions::InterruptedException** (p. 1804), **decaf::lang::exceptions::InvalidStateException** (p. 1819), **decaf::lang::exceptions::NoSuchElementException** (p. 2425), **decaf::lang::exceptions::NullPointerException** (p. 2431), **decaf::lang::exceptions::NumberFormatException** (p. 2437), **decaf::lang::exceptions::RuntimeException** (p. 2821), **decaf::lang::exceptions::UnsupportedOperationException** (p. 3307), **decaf::net::BindException** (p. 723), **decaf::net::ConnectException** (p. 1130), **decaf::net::HttpRetryException** (p. 1719), **decaf::net::MalformedURLException** (p. 2093), **decaf::net::NoRouteToHostException** (p. 2419), **decaf::net::PortUnreachableException** (p. 2524), **decaf::net::ProtocolException** (p. 2669), **decaf::net::SocketException** (p. 2973), **decaf::net::SocketTimeoutException** (p. 2992), **decaf::net::UnknownHostException** (p. 3296), **decaf::net::UnknownServiceException** (p. 3299), **decaf::net::URISyntaxException** (p. 3337), **decaf::nio::BufferOverflowException** (p. 836), **decaf::nio::BufferUnderflowException** (p. 839), **decaf::nio::InvalidMarkException** (p. 1815), **decaf::nio::ReadOnlyBufferException** (p. 2687), **decaf::util::concurrent::BrokenBarrierException** (p. 744), **decaf::util::concurrent::CancellationException** (p. 967), **decaf::util::concurrent::ExecutionException** (p. 1607), **decaf::util::concurrent::RejectedExecutionException** (p. 2701), and **decaf::util::concurrent::TimeoutException** (p. 3187).

6.295.2.3 virtual const std::exception* decaf::lang::Exception::getCause () const [inline, virtual]

Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.

Returns:

a const pointer reference to the causal exception, if there was no cause associated with this exception then NULL is returned.

Implements **decaf::lang::Throwable** (p. 3183).

6.295.2.4 virtual std::string decaf::lang::Exception::getMessage () const [inline, virtual]

Gets the message for this exception.

Returns:

Text formatted error message

Implements **decaf::lang::Throwable** (p. 3183).

6.295.2.5 virtual std::vector< std::pair< std::string, int> > decaf::lang::Exception::getStackTrace () const [virtual]

Provides the stack trace for every point where this exception was caught, marked, and rethrown. The first item in the returned vector is the first point where the mark was set (e.g. where the exception was created).

Returns:

the stack trace.

Implements **decaf::lang::Throwable** (p. 3183).

6.295.2.6 virtual std::string decaf::lang::Exception::getStackTraceString () const [virtual]

Gets the stack trace as one contiguous string.

Returns:

string with formatted stack trace data

Implements **decaf::lang::Throwable** (p. 3183).

6.295.2.7 virtual void decaf::lang::Exception::initCause (const std::exception * *cause*) [virtual]

Initializes the contained cause exception with the one given. A copy is made to avoid ownership issues.

Parameters:

cause The exception that was the cause of this one.

Implements **decaf::lang::Throwable** (p. 3183).

6.295.2.8 virtual Exception& decaf::lang::Exception::operator= (const Exception & *ex*) [virtual]

Assignment operator.

Parameters:

ex const reference to another **Exception** (p. 1574)

6.295.2.9 virtual void decaf::lang::Exception::printStackTrace (std::ostream & *stream*) const [virtual]

Prints the stack trace to the given output stream.

Parameters:

stream the target output stream.

Implements **decaf::lang::Throwable** (p. 3184).

6.295.2.10 virtual void decaf::lang::Exception::printStackTrace () const [virtual]

Prints the stack trace to std::err.

Implements **decaf::lang::Throwable** (p. 3184).

6.295.2.11 virtual void decaf::lang::Exception::setMark (const char * *file*, const int *lineNumber*) [virtual]

Adds a file/line number to the stack trace.

Parameters:

file The name of the file calling this method (use __FILE__).

lineNumber The line number in the calling file (use __LINE__).

Implements **decaf::lang::Throwable** (p. 3184).

Referenced by activemq::exceptions::BrokerException::BrokerException(), and decaf::lang::exceptions::NumberFormatException::NumberFormatException().

6.295.2.12 virtual void decaf::lang::Exception::setMessage (const char * *msg*, ...) [virtual]

Sets the cause for this exception.

Parameters:

msg the format string for the msg.

... params to format into the string

Referenced by activemq::exceptions::BrokerException::BrokerException().

6.295.2.13 virtual void decaf::lang::Exception::setStackTrace (const std::vector< std::pair< std::string, int > > & *trace*) [protected, virtual]

6.295.2.14 virtual const char* decaf::lang::Exception::what () const throw () [inline, virtual]

Implement method from std::exception.

Returns:

the const char* of `getMessage()` (p. 1578).

6.295.3 Field Documentation

6.295.3.1 std::exception* decaf::lang::Exception::cause [protected]

The **Exception** (p. 1574) that caused this one to be thrown.

6.295.3.2 std::string decaf::lang::Exception::message [protected]

The cause of this exception.

6.295.3.3 std::vector< std::pair< std::string, int> > decaf::lang::Exception::stackTrace [protected]

The stack trace.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Exception.h**

6.296 cms::ExceptionListener Class Reference

If a CMS provider detects a serious problem, it notifies the client application through an `ExceptionListener` (p. 1581) that is registered with the `Connection` (p. 1131).

`#include <src/main/cms/ExceptionListener.h>`

Public Member Functions

- virtual ~**ExceptionListener** ()
- virtual void **onException** (const **cms::CMSException** &ex)=0

  Called when an exception occurs.

6.296.1 Detailed Description

If a CMS provider detects a serious problem, it notifies the client application through an `ExceptionListener` (p. 1581) that is registered with the `Connection` (p. 1131). An exception listener allows a client to be notified of a problem asynchronously. Some connections only consume messages via the asynchronous event mechanism so they would have no other way to learn that their connection has failed.

Since:

1.0

6.296.2 Constructor & Destructor Documentation

6.296.2.1 virtual cms::ExceptionListener::~ExceptionListener () [inline, virtual]

6.296.3 Member Function Documentation

6.296.3.1 virtual void cms::ExceptionListener::onException (const cms::CMSException & *ex*) [pure virtual]

Called when an exception occurs. Once notified of an exception the caller should no longer use the resource that generated the exception.

Parameters:

ex Exception Object that occurred.

The documentation for this class was generated from the following file:

- src/main/cms/**ExceptionListener.h**

6.297 activemq::commands::ExceptionResponse Class Reference

`#include <src/main/activemq/commands/ExceptionResponse.h>`Inheritance diagram for activemq::commands::ExceptionResponse:

Public Member Functions

- **ExceptionResponse** ()
- virtual ~**ExceptionResponse** ()
- virtual unsigned char **getDataStructureType** () const

  Get the unique identifier that this object and its own Marshaler share.

- virtual **ExceptionResponse** * **cloneDataStructure** () const

  Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

  Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure*** (p. *1461) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure*** (p. *1461) passed in to this one, and returns if they are equivalent.*

- virtual const **Pointer**< **BrokerError** > & **getException** () const
- virtual **Pointer**< **BrokerError** > & **getException** ()

6.297.1 Constructor & Destructor Documentation

6.297.1.1 activemq::commands::ExceptionResponse::ExceptionResponse (const ExceptionResponse &) [inline, protected]

6.297.1.2 activemq::commands::ExceptionResponse::ExceptionResponse ()

6.297.1.3 virtual activemq::commands::ExceptionResponse::~ExceptionResponse () [virtual]

6.297.2 Member Function Documentation

6.297.2.1 virtual ExceptionResponse* activemq::commands::ExceptionResponse::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::Response** (p. 2782).

6.297.2.2 virtual void activemq::commands::ExceptionResponse::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::Response** (p. 2782).

6.297.2.3 virtual bool activemq::commands::ExceptionResponse::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::Response** (p. 2782).

6.297.2.4 virtual unsigned char activemq::commands::ExceptionResponse::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Reimplemented from **activemq::commands::Response** (p. 2783).

6.297.2.5 virtual Pointer<BrokerError>& activemq::commands::ExceptionResponse::getException () [virtual]

6.297.2.6 virtual const Pointer<BrokerError>& activemq::commands::ExceptionResponse::getException () const [virtual]

6.297.2.7 ExceptionResponse& activemq::commands::ExceptionResponse::operator= (const ExceptionResponse &) [inline, protected]

6.297.2.8 virtual void activemq::commands::ExceptionResponse::setException (const Pointer< BrokerError > & *exception*) [virtual]

6.297.2.9 virtual std::string activemq::commands::ExceptionResponse::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::Response** (p. 2783).

6.297.3 Field Documentation

6.297.3.1 Pointer<BrokerError> activemq::commands::ExceptionResponse::exception [protected]

6.297.3.2 const unsigned char activemq::commands::ExceptionResponse::ID_EXCEPTIONRESPONSE = 31 [static]

() [inline, virtual]

6.298.3 Member Function Documentation

6.298.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::createObject
() const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2792).

6.298.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::getDataStructu
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2792).

6.298.3.3 virtual void activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::looseMarshal
(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2792).

6.298.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::looseUnmarsha (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2793).

6.298.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2793).

6.298.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2794).

6.298.3.7 virtual void activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::tightUnmarsha (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2795).

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::ResponseMarshaller** (p. 2814).

6.301.3.7 virtual void activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller::tightUnmarsha (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::ResponseMarshaller** (p. 2815).

The documentation for this class was generated from the following file:

() [inline]

6.302.2.2 virtual activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::~ExceptionR
() [inline, virtual]

6.302.3 Member Function Documentation

6.302.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::createObject
() const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2802).

6.302.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::getDataStructu
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2802).

6.302.3.3 virtual void activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::looseMarshal
(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2802).

6.302.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::looseUnmarsha (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2803).

6.302.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2803).

6.302.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2804).

6.302.3.7 virtual void activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::tightUnmarsha (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2805).

6.303.1 Constructor & Destructor Documentation

6.303.1.1 decaf::util::concurrent::ExecutionException::ExecutionException () throw () [inline]

Default Constructor.

6.303.1.2 decaf::util::concurrent::ExecutionException::ExecutionException (const decaf::lang::Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex - An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.303.1.3 decaf::util::concurrent::ExecutionException::ExecutionException (const ExecutionException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex - The Exception to copy in this new instance.

References decaf::lang::Exception::Exception().

6.303.1.4 decaf::util::concurrent::ExecutionException::ExecutionException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.303.1.5 decaf::util::concurrent::ExecutionException::ExecutionException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file - The file name where exception occurs

lineNumber - The line number where the exception occurred.

msg - The message to report

... - The list of primitives that are formatted into the message

6.303.1.6 decaf::util::concurrent::ExecutionException::ExecutionException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file - The file name where exception occurs

lineNumber - The line number where the exception occurred.

cause - The exception that was the cause for this one to be thrown.

msg - The message to report

... - list of primitives that are formatted into the message

6.303.1.7 virtual decaf::util::concurrent::ExecutionException::~ExecutionException () throw () [inline, virtual]

6.303.2 Member Function Documentation

6.303.2.1 virtual ExecutionException* decaf::util::concurrent::ExecutionException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new instance of an exception that is a clone of this one.

Reimplemented from **decaf::lang::Exception** (p. 1577).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**ExecutionException.h**

6.304 decaf::util::concurrent::Executor Class Reference

An object that executes submitted **decaf.lang.Runnable** (p. 2816) tasks.

`#include <src/main/decaf/util/concurrent/Executor.h>`Inheritance diagram for decaf::util::concurrent::Executor:

Public Member Functions

- virtual ~**Executor** ()
- virtual void **execute** (Runnable *command)=0 throw (decaf::util::concurrent::RejectedExecutionException, decaf::lang::exceptions::NullPointerException)

  Executes the given command at some time in the future.

6.304.1 Detailed Description

An object that executes submitted **decaf.lang.Runnable** (p. 2816) tasks. This interface provides a way of decoupling task submission from the mechanics of how each task will be run, including details of thread use, scheduling, etc. An `Executor` (p. 1608) is normally used instead of explicitly creating threads. For example, rather than invoking `new Thread(new(RunnableTask())).start()` for each of a set of tasks, you might use:

```
Executor (p. 1608) executor =  anExecutor;
executor->execute( new RunnableTask1() );
executor->execute( new RunnableTask2() );
...
```

However, the `Executor` (p. 1608) interface does not strictly require that execution be asynchronous. In the simplest case, an executor can run the submitted task immediately in the caller's thread:

```
class DirectExecutor : public Executor (p. 1608) {
public:

    void execute( Runnable* r ) (p. 1609) {
        r->run();
    }

}
```

More typically, tasks are executed in some thread other than the caller's thread. The executor below spawns a new thread for each task.

```
class ThreadPerTaskExecutor : public Executor (p. 1608) {
public:
    std::vector<Thread*gt; threads;
```

```
    void execute( Runnable* r ) (p. 1609) {
        threads.push_back( new Thread( r ) );
        threads.rbegin()->start();
    }

}
```

The `Executor` (p. 1608) implementations provided in this package implement **decaf.util.concurrent.ExecutorService** (p. 1610), which is a more extensive interface. The **decaf.util.concurrent.ThreadPoolExecutor** (p. ??) class provides an extensible thread pool implementation. The **decaf.util.concurrentExecutor** (p. ??) class provides convenient factory methods for these Executors.

Since:

1.0

6.304.2 Constructor & Destructor Documentation

6.304.2.1 virtual decaf::util::concurrent::Executor::~Executor () [inline, virtual]

6.304.3 Member Function Documentation

6.304.3.1 virtual void decaf::util::concurrent::Executor::execute (Runnable * *command*) throw (decaf::util::concurrent::RejectedExecutionException, decaf::lang::exceptions::NullPointerException) [pure virtual]

Executes the given command at some time in the future. The command may execute in a new thread, in a pooled thread, or in the calling thread, at the discretion of the `Executor` (p. 1608) implementation.

Parameters:

command the runnable task

Exceptions:

RejectedExecutionException (p. ***2699***) if this task cannot be accepted for execution.

NullPointerException if command is null

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**Executor.h**

6.305 decaf::util::concurrent::ExecutorService Class Reference

An **Executor** (p. 1608) that provides methods to manage termination and methods that can produce a **Future** (p. 1701) for tracking progress of one or more asynchronous tasks.

`#include <src/main/decaf/util/concurrent/ExecutorService.h>`Inheritance diagram for decaf::util::concurrent::ExecutorService:

Public Member Functions

- virtual ~**ExecutorService** ()
- bool **awaitTermination** (long long timeout, const **TimeUnit** &unit)=0 throw (decaf::lang::exceptions::InterruptedException)

  Blocks until all tasks have completed execution after a shutdown request, or the timeout occurs, or the current thread is interrupted, whichever happens first.

6.305.1 Detailed Description

An **Executor** (p. 1608) that provides methods to manage termination and methods that can produce a **Future** (p. 1701) for tracking progress of one or more asynchronous tasks. An **ExecutorService** (p. 1610) can be shut down, which will cause it to reject new tasks. Two different methods are provided for shutting down an **ExecutorService** (p. 1610). The shutdown() method will allow previously submitted tasks to execute before terminating, while the shutdownNow() method prevents waiting tasks from starting and attempts to stop currently executing tasks. Upon termination, an executor has no tasks actively executing, no tasks awaiting execution, and no new tasks can be submitted. An unused **ExecutorService** (p. 1610) should be shut down to allow reclamation of its resources.

Method submit extends base method **Executor.execute** (p. 1609)(**decaf.lang.Runnable** (p. 2816)) by creating and returning a **Future** (p. 1701) that can be used to cancel execution and/or wait for completion. Methods invokeAny and invokeAll perform the most commonly useful forms of bulk execution, executing a collection of tasks and then waiting for at least one, or all, to complete. (Class ExecutorCompletionService can be used to write customized variants of these methods.)

The Executors class provides factory methods for the executor services provided in this package.

Since:

1.0

6.305.2 Constructor & Destructor Documentation

6.305.2.1 virtual decaf::util::concurrent::ExecutorService::~ExecutorService () [inline, virtual]

6.305.3 Member Function Documentation

6.305.3.1 bool decaf::util::concurrent::ExecutorService::awaitTermination (long long *timeout*, const TimeUnit & *unit*) throw (decaf::lang::exceptions::InterruptedException) [pure virtual]

Blocks until all tasks have completed execution after a shutdown request, or the timeout occurs, or the current thread is interrupted, whichever happens first.

Parameters:

timeout The amount of time to wait before timing out the Wait operation.

unit The Units that comprise the timeout value.

Returns:

true if the executer terminated before the given timeout value elapsed.

Exceptions:

InterruptedException - if interrupted while waiting.

6.306.1 Constructor & Destructor Documentation

6.306.1.1 activemq::transport::failover::FailoverTransport::FailoverTransport ()

6.306.1.2 virtual activemq::transport::failover::FailoverTransport::~FailoverTransport () [virtual]

6.306.2 Member Function Documentation

6.306.2.1 void activemq::transport::failover::FailoverTransport::add (const std::string & *uri*)

Adds a New URI to the List of URIs this transport can Connect to.

Parameters:

uri A String version of a URI to add to the URIs to failover to.

6.306.2.2 virtual void activemq::transport::failover::FailoverTransport::addURI (const List< URI > & *uris*) [virtual]

Add a URI to the list of URI's that will represent the set of Transports that this **Transport** (p. 3273) is a composite of.

Parameters:

uris The new URIs to add to the set this composite maintains.

Implements **activemq::transport::CompositeTransport** (p. 1095).

6.306.2.3 virtual void activemq::transport::failover::FailoverTransport::close () throw (decaf::io::IOException) [virtual]

Stops the polling thread and closes the streams. This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

Exceptions:

IOException if errors occur.

Implements **decaf::io::Closeable** (p. 1019).

6.306.2.4 long long activemq::transport::failover::FailoverTransport::getBackOffMultiplier () const [inline]

6.306.2.5 int activemq::transport::failover::FailoverTransport::getBackupPoolSize () const [inline]

6.306.2.6 long long activemq::transport::failover::FailoverTransport::getInitialReconnectDelay () const [inline]

6.306.2.7 int activemq::transport::failover::FailoverTransport::getMaxCacheSize () const [inline]

6.306.2.8 int activemq::transport::failover::FailoverTransport::getMaxReconnectAttempts () const [inline]

6.306.2.9 long long activemq::transport::failover::FailoverTransport::getMaxReconnectDelay () const [inline]

6.306.2.10 long long activemq::transport::failover::FailoverTransport::getReconnectDelay () const [inline]

6.306.2.11 virtual std::string activemq::transport::failover::FailoverTransport::getRemoteAddress () const [virtual]

Returns:

the remote address for this connection

Implements **activemq::transport::Transport** (p. 3274).

6.306.2.12 long long activemq::transport::failover::FailoverTransport::getTimeout () const [inline]

6.306.2.13 virtual TransportListener* activemq::transport::failover::FailoverTransport::getTransportListener () const [virtual]

Gets the observer of asynchronous exceptions from this transport.

Returns:

The listener of transport events.

Implements **activemq::transport::Transport** (p. 3274).

6.306.2.14 void activemq::transport::failover::FailoverTransport::handleTransportFailure (const decaf::lang::Exception & *error*) throw (decaf::lang::Exception) [protected]

Called when this class' **TransportListener** (p. 3289) is notified of a Failure.

Parameters:

error - The CMS Exception that was thrown.

Exceptions:

Exception if an error occurs.

6.306.2.15 bool activemq::transport::failover::FailoverTransport::isBackup () const [inline]

6.306.2.16 virtual bool activemq::transport::failover::FailoverTransport::isClosed () const [inline, virtual]

Has the **Transport** (p. 3273) been shutdown and no longer usable.

Returns:

true if the **Transport** (p. 3273)

Implements **activemq::transport::Transport** (p. 3275).

6.306.2.17 virtual bool activemq::transport::failover::FailoverTransport::isConnected () const [inline, virtual]

Is the **Transport** (p. 3273) Connected to its Broker.

Returns:

true if a connection has been made.

Implements **activemq::transport::Transport** (p. 3275).

6.306.2.18 virtual bool activemq::transport::failover::FailoverTransport::isFaultTolerant () const [inline, virtual]

Is this **Transport** (p. 3273) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns:

true if the **Transport** (p. 3273) is fault tolerant.

Implements **activemq::transport::Transport** (p. 3275).

6.306.2.19 bool activemq::transport::failover::FailoverTransport::isInitialized () const [inline]

Returns true if the **Transport** (p. 3273) has been initialized by a BrokerInfo command.

Returns:

true if the **Transport** (p. 3273) has been initialized by a BrokerInfo command.

6.306.2.20 virtual bool activemq::transport::failover::FailoverTransport::isPending () const [virtual]

Returns:

true if there is a need for the iterate method to be called by this classes task runner.

Implements **activemq::threads::CompositeTask** (p. 1090).

6.306.2.21 bool activemq::transport::failover::FailoverTransport::isRandomize () const [inline]

6.306.2.22 bool activemq::transport::failover::FailoverTransport::isTrackMessages () const [inline]

6.306.2.23 bool activemq::transport::failover::FailoverTransport::isUseExponentialBackOff () const [inline]

6.306.2.24 virtual bool activemq::transport::failover::FailoverTransport::iterate () [virtual]

Performs the actual Reconnect operation for the **FailoverTransport** (p. 1612), when a connection is made this method returns false to indicate it doesn't need to run again, otherwise it returns true to indicate its still trying to connect.

Returns:

false to indicate a connection, true to indicate it needs to try again.

Implements **activemq::threads::Task** (p. 3148).

6.306.2.25 virtual Transport* activemq::transport::failover::FailoverTransport::narrow (const std::type_info & *typeId*) [inline, virtual]

Narrows down a Chain of Transports to a specific **Transport** (p. 3273) to allow a higher level transport to skip intermediate Transports in certain circumstances.

Parameters:

typeId - The type_info of the Object we are searching for.

Returns:

the requested Object. or NULL if its not in this chain.

Implements **activemq::transport::Transport** (p. 3275).

References activemq::transport::Transport::narrow().

6.306.2.26 virtual void activemq::transport::failover::FailoverTransport::oneway (const Pointer< Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command the command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 3276).

6.306.2.27 virtual void activemq::transport::failover::FailoverTransport::reconnect (const decaf::net::URI & *uri*) throw (decaf::io::IOException) [virtual]

reconnect to another location

Parameters:

uri

Exceptions:

IOException on failure of if not supported

Implements **activemq::transport::Transport** (p. 3276).

6.306.2.28 void activemq::transport::failover::FailoverTransport::reconnect ()

Indicates that the **Transport** (p. 3273) needs to reconnect to another URI in its list.

6.306.2.29 virtual void activemq::transport::failover::FailoverTransport::removeURI (const List< URI > & *uris*) [virtual]

Remove a URI from the set of URI's that represents the set of Transports that this **Transport** (p. 3273) is composed of, removing a URI for which the composite has created a connected **Transport** (p. 3273) should result in that **Transport** (p. 3273) being disposed of.

Parameters:

uris The new URIs to remove to the set this composite maintains.

Implements **activemq::transport::CompositeTransport** (p. 1096).

6.306.2.30 virtual Pointer<Response> activemq::transport::failover::FailoverTransport::request (const Pointer< Command > & *command*, unsigned int *timeout*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command - The command to be sent.

timeout - The time to wait for this response.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 3276).

6.306.2.31 virtual Pointer<Response> activemq::transport::failover::FailoverTransport::request (const Pointer< Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command the command to be sent.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 3277).

6.306.2.32 void activemq::transport::failover::FailoverTransport::restoreTransport (const Pointer< Transport > & *transport*) throw (decaf::io::IOException) [protected]

Given a **Transport** (p. 3273) restore the state of the Client's connection to the Broker using the data accumulated in the State Tracker.

Parameters:

transport The new **Transport** (p. 3273) connected to the Broker.

Exceptions:

IOException if an errors occurs while restoring the old state.

6.306.2.33 void activemq::transport::failover::FailoverTransport::setBackOffMultiplier (long long *value*) [inline]

6.306.2.34 void activemq::transport::failover::FailoverTransport::setBackup (bool *value*) [inline]

6.306.2.35 void activemq::transport::failover::FailoverTransport::setBackupPoolSize (int *value*) [inline]

6.306.2.36 void activemq::transport::failover::FailoverTransport::setInitialized (bool *value*) [inline]

Sets the initialized state of this **Transport** (p. 3273) to true.

Parameters:

value - true if this **Transport** (p. 3273) has been initialized.

6.306.2.37 void activemq::transport::failover::FailoverTransport::setInitialReconnectDelay (long long *value*) `[inline]`

6.306.2.38 void activemq::transport::failover::FailoverTransport::setMaxCacheSize (int *value*) `[inline]`

6.306.2.39 void activemq::transport::failover::FailoverTransport::setMaxReconnectAttempts (int *value*) `[inline]`

6.306.2.40 void activemq::transport::failover::FailoverTransport::setMaxReconnectDelay (long long *value*) `[inline]`

6.306.2.41 void activemq::transport::failover::FailoverTransport::setRandomize (bool *value*) `[inline]`

6.306.2.42 void activemq::transport::failover::FailoverTransport::setReconnectDelay (long long *value*) `[inline]`

6.306.2.43 void activemq::transport::failover::FailoverTransport::setTimeout (long long *value*) `[inline]`

6.306.2.44 void activemq::transport::failover::FailoverTransport::setTrackMessages (bool *value*) `[inline]`

6.306.2.45 virtual void activemq::transport::failover::FailoverTransport::setTransportListener (TransportListener * *listener*) `[virtual]`

Sets the observer of asynchronous events from this transport.

Parameters:

listener the listener of transport events.

Implements **activemq::transport::Transport** (p. 3277).

6.306.2.46 void activemq::transport::failover::FailoverTransport::setUseExponentialBackOff (bool *value*) `[inline]`

6.306.2.47 virtual void activemq::transport::failover::FailoverTransport::setWireFormat (const Pointer< wireformat::WireFormat > &wireFormat *AMQCPP_UNUSED*) `[inline, virtual]`

Sets the WireFormat instance to use.

Parameters:

wireFormat The WireFormat the object used to encode / decode commands.

6.306.2.48 virtual void activemq::transport::failover::FailoverTransport::start () throw (decaf::io::IOException) [virtual]

Starts this transport object and creates the thread for polling on the input stream for commands. If this object has been closed, throws an exception. Before calling start, the caller must set the IO streams and the reader and writer objects.

Exceptions:

IOException if an error occurs or if this transport has already been closed.

Implements **activemq::transport::Transport** (p. 3278).

6.306.2.49 virtual void activemq::transport::failover::FailoverTransport::stop () throw (decaf::io::IOException) [virtual]

Stop the **Transport** (p. 3273).

Exceptions:

IOException if an error occurs while stopping the **Transport** (p. 3273).

Implements **activemq::transport::Transport** (p. 3278).

6.306.3 Friends And Related Function Documentation

6.306.3.1 friend class FailoverTransportListener [friend]

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/**FailoverTransport.h**

6.307 activemq::transport::failover::FailoverTransportFactory Class Reference

Creates an instance of a **FailoverTransport** (p. 1612).

`#include <src/main/activemq/transport/failover/FailoverTransportFactory.h>`Inheritance diagram for activemq::transport::failover::FailoverTransportFactory:

Public Member Functions

- virtual ~**FailoverTransportFactory** ()
- virtual **Pointer**< **Transport** > **create** (const **decaf::net::URI** &location) throw (exceptions::ActiveMQException)

  *Creates a fully configured **Transport** (p. 3273) instance which could be a chain of filters and transports.*

- virtual **Pointer**< **Transport** > **createComposite** (const **decaf::net::URI** &location) throw (exceptions::ActiveMQException)

6.307.1 Detailed Description

Creates an instance of a **FailoverTransport** (p. 1612).

Since:

3.0

6.307.2 Constructor & Destructor Documentation

6.307.2.1 virtual activemq::transport::failover::FailoverTransportFactory::~FailoverTransportFactory () [inline, virtual]

6.307.3 Member Function Documentation

6.307.3.1 virtual Pointer<Transport> activemq::transport::failover::FailoverTransportFactory::create (const decaf::net::URI & *location*) throw (exceptions::ActiveMQException) [virtual]

Creates a fully configured **Transport** (p. 3273) instance which could be a chain of filters and transports.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQexception if an error occurs

Implements **activemq::transport::TransportFactory** (p. 3279).

6.307.3.2 virtual Pointer<Transport> activemq::transport::failover::FailoverTransportFactory::createComposite (const decaf::net::URI & *location*) throw (exceptions::ActiveMQException) [virtual]

Creates a slimed down **Transport** (p. 3273) instance which can be used in composite transport instances.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQexception if an error occurs

Implements **activemq::transport::TransportFactory** (p. 3280).

6.307.3.3 virtual Pointer<Transport> activemq::transport::failover::FailoverTransportFactory::doCreateComposite (const decaf::net::URI & *location*, const decaf::util::Properties & *properties*) throw (exceptions::ActiveMQException) [protected, virtual]

Creates a slimed down **Transport** (p. 3273) instance which can be used in composite transport instances.

Parameters:

location - URI location to connect to.

properties - Properties to apply to the transport.

Returns:

Pointer to a new **FailoverTransport** (p. 1612) instance.

Exceptions:

ActiveMQexception if an error occurs

- src/main/activemq/transport/failover/**FailoverTransportFactory.h**

6.308 activemq::transport::failover::FailoverTransportListener Class Reference

Utility class used by the **Transport** (p. 3273) to perform the work of responding to events from the active **Transport** (p. 3273).

`#include <src/main/activemq/transport/failover/FailoverTransportListener.h>`Inheritance diagram for activemq::transport::failover::FailoverTransportListener:

Public Member Functions

- **FailoverTransportListener** (**FailoverTransport** *parent)
- virtual ~**FailoverTransportListener** ()
- virtual void **onCommand** (const **Pointer**< **Command** > &command)

  Event handler for the receipt of a command.

- virtual void **onException** (const **decaf::lang::Exception** &ex)

  Event handler for an exception from a command transport.

- virtual void **transportInterrupted** ()

  The transport has suffered an interruption from which it hopes to recover.

- virtual void **transportResumed** ()

  The transport has resumed after an interruption.

6.308.1 Detailed Description

Utility class used by the **Transport** (p. 3273) to perform the work of responding to events from the active **Transport** (p. 3273).

Since:

3.0

6.308.2 Constructor & Destructor Documentation

6.308.2.1 activemq::transport::failover::FailoverTransportListener::FailoverTransportListener (FailoverTransport * *parent*)

6.308.2.2 virtual activemq::transport::failover::FailoverTransportListener::~FailoverTransportListener () [virtual]

6.308.3 Member Function Documentation

6.308.3.1 virtual void activemq::transport::failover::FailoverTransportListener::onCommand (const Pointer< Command > & *command*) [virtual]

Event handler for the receipt of a command. The transport passes off all received commands to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 3273) deletes the command upon receipt.

Parameters:

command the received command object.

Implements **activemq::transport::TransportListener** (p. 3289).

6.308.3.2 virtual void activemq::transport::failover::FailoverTransportListener::onException (const decaf::lang::Exception & *ex*) [virtual]

Event handler for an exception from a command transport.

Parameters:

ex The exception.

Implements **activemq::transport::TransportListener** (p. 3290).

6.308.3.3 virtual void activemq::transport::failover::FailoverTransportListener::transportInterrupted () [virtual]

The transport has suffered an interruption from which it hopes to recover.

Implements **activemq::transport::TransportListener** (p. 3290).

6.308.3.4 virtual void activemq::transport::failover::FailoverTransportListener::transportResumed () [virtual]

The transport has resumed after an interruption.

Implements **activemq::transport::TransportListener** (p. 3290).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/**FailoverTransportListener.h**

6.309 decaf::util::logging::Filter Class Reference

A **Filter** (p. 1630) can be used to provide fine grain control over what is logged, beyond the control provided by log levels.

`#include <src/main/decaf/util/logging/Filter.h>`

Public Member Functions

- virtual ~**Filter** ()
- virtual bool **isLoggable** (const **LogRecord** &record) const =0

  Check if a given log record should be published.

6.309.1 Detailed Description

A **Filter** (p. 1630) can be used to provide fine grain control over what is logged, beyond the control provided by log levels. Each **Logger** (p. 2028) and each **Handler** (p. 1709) can have a filter associated with it. The **Logger** (p. 2028) or **Handler** (p. 1709) will call the isLoggable method to check if a given **LogRecord** (p. 2050) should be published. If isLoggable returns false, the **LogRecord** (p. 2050) will be discarded.

6.309.2 Constructor & Destructor Documentation

6.309.2.1 virtual decaf::util::logging::Filter::~Filter () [inline, virtual]

6.309.3 Member Function Documentation

6.309.3.1 virtual bool decaf::util::logging::Filter::isLoggable (const LogRecord & *record*) const [pure virtual]

Check if a given log record should be published.

Parameters:

record the `LogRecord` (p. 2050) to check.

Returns:

true if the record is loggable.

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**Filter.h**

6.310 decaf::io::FilterInputStream Class Reference

A **FilterInputStream** (p. 1631) contains some other input stream, which it uses as its basic source of data, possibly transforming the data along the way or providing additional functionality.

`#include <src/main/decaf/io/FilterInputStream.h>`Inheritance diagram for decaf::io::FilterInputStream:

Public Member Functions

- **FilterInputStream** (**InputStream** *__inputStream__, bool **own**=false)

  *Constructor to create a wrapped **InputStream** (p. 1740).*

- virtual ~**FilterInputStream** ()
- virtual std::size_t **available** () const throw (IOException)

  Returns the number of bytes that can be read from this input stream without blocking.

- virtual int **read** () throw (IOException)

  Reads the next byte of data from this input stream.

- virtual int **read** (unsigned char *buffer, std::size_t offset, std::size_t bufferSize) throw (IOException, lang::exceptions::NullPointerException)

  Reads up to len bytes of data from this input stream into an array of bytes.

- virtual void **close** () throw (io::IOException)

  *Close the Stream, the **FilterOutputStream** (p. 1640) simply calls the close method of the underlying stream.*

- virtual std::size_t **skip** (std::size_t num) throw (io::IOException, lang::exceptions::UnsupportedOperationException)

  Skips over and discards n bytes of data from this input stream.

- virtual void **mark** (int readLimit)

  Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

- virtual void **reset** () throw (IOException)

  Repositions this stream to the position at the time the mark method was last called on this input stream.

- virtual bool **markSupported** () const

  Determines if this input stream supports the mark and reset methods.

- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)

  Locks the object.

- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)

  Unlocks the object.

- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals the waiters on this object that it can now wake up and continue.

Protected Member Functions

- virtual bool **isClosed** () const

Protected Attributes

- **InputStream** * **inputStream**
- **util::concurrent::Mutex mutex**
- bool **own**
- volatile bool **closed**

6.310.1 Detailed Description

A **FilterInputStream** (p. 1631) contains some other input stream, which it uses as its basic source of data, possibly transforming the data along the way or providing additional functionality. The class **FilterInputStream** (p. 1631) itself simply overrides all methods of **InputStream** (p. 1740) with versions that pass all requests to the contained input stream. Subclasses of **FilterInputStream** (p. 1631) may further override some of these methods and may also provide additional methods and fields.

6.310.2 Constructor & Destructor Documentation

6.310.2.1 decaf::io::FilterInputStream::FilterInputStream (InputStream * *inputStream*, bool *own* = false) [inline]

Constructor to create a wrapped **InputStream** (p. 1740).

Parameters:

inputStream the stream to wrap and filter

own indicates if we own the stream object, defaults to false

6.310.2.2 virtual decaf::io::FilterInputStream::~FilterInputStream () [inline, virtual]

References DECAF_CATCH_NOTHROW, and DECAF_CATCHALL_NOTHROW.

6.310.3 Member Function Documentation

6.310.3.1 virtual std::size_t decaf::io::FilterInputStream::available () const throw (IOException) [inline, virtual]

Returns the number of bytes that can be read from this input stream without blocking. This method simply performs in.available() and returns the result.

Returns:

the number of bytes available without blocking.

Implements **decaf::io::InputStream** (p. 1741).

Reimplemented in **decaf::io::BufferedInputStream** (p. 810).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.310.3.2 virtual void decaf::io::FilterInputStream::close () throw (io::IOException) [inline, virtual]

Close the Stream, the **FilterOutputStream** (p. 1640) simply calls the close method of the underlying stream.

Exceptions:

Exception

Implements **decaf::io::Closeable** (p. 1019).

Reimplemented in **decaf::io::BufferedInputStream** (p. 811).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.310.3.3 virtual bool decaf::io::FilterInputStream::isClosed () const [inline, protected, virtual]

Returns:

true if this stream has been closed.

6.310.3.4 virtual void decaf::io::FilterInputStream::lock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3123).

6.310.3.5 virtual void decaf::io::FilterInputStream::mark (int readLimit) [inline, virtual]

Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes. If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Parameters:

readLimit The max bytes read before marked position is invalid.

Implements **decaf::io::InputStream** (p. 1741).

Reimplemented in **decaf::io::BufferedInputStream** (p. 811).

References DECAF_CATCHALL_NOTHROW.

6.310.3.6 virtual bool decaf::io::FilterInputStream::markSupported () const [inline, virtual]

Determines if this input stream supports the mark and reset methods. Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

Returns:

true if this stream instance supports marks

Implements **decaf::io::InputStream** (p. 1741).

Reimplemented in **decaf::io::BufferedInputStream** (p. 811).

References DECAF_CATCHALL_NOTHROW.

6.310.3.7 virtual void decaf::io::FilterInputStream::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3124).

6.310.3.8 virtual void decaf::io::FilterInputStream::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3125).

6.310.3.9 virtual int decaf::io::FilterInputStream::read (unsigned char * *buffer*, std::size_t *offset*, std::size_t *bufferSize*) throw (IOException, lang::exceptions::NullPointerException) [inline, virtual]

Reads up to len bytes of data from this input stream into an array of bytes. This method blocks until some input is available. This method simply performs in.read(b, len) and returns the result.

Parameters:

buffer (out) the target buffer.

offset the position to start reading in the passed buffer.

bufferSize the size of the output buffer.

Returns:

The number of bytes read or -1 if EOF is detected

Exceptions:

IOException *(p. 1820)* thrown if an error occurs.

NullPointerException

Implements **decaf::io::InputStream** (p. 1742).

Reimplemented in **activemq::io::LoggingInputStream** (p. 2038), **decaf::io::BufferedInputStream** (p. 811), and **decaf::io::DataInputStream** (p. 1381).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.310.3.10 virtual int decaf::io::FilterInputStream::read () throw (IOException) [inline, virtual]

Reads the next byte of data from this input stream. The value byte is returned as an unsigned char in the range 0 to 255. If no byte is available because the end of the stream has been reached, the value -1 is returned. This method blocks until input data is available, the end of the stream is detected, or an exception is thrown. This method simply performs in.read() and returns the result.

Returns:

The next byte.

Exceptions:

IOException *(*p. ***1820)*** thrown if an error occurs.

Implements **decaf::io::InputStream** (p. 1742).

Reimplemented in **activemq::io::LoggingInputStream** (p. 2039), **decaf::io::BufferedInputStream** (p. 812), and **decaf::io::DataInputStream** (p. 1382).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

Referenced by decaf::io::DataInputStream::read().

6.310.3.11 virtual void decaf::io::FilterInputStream::reset () throw (IOException) [inline, virtual]

Repositions this stream to the position at the time the mark method was last called on this input stream. If the method markSupported returns true, then: ∗ If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 1820) might be thrown. ∗ If such an **IOException** (p. 1820) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset. If the method markSupported returns false, then: ∗ The call to reset may throw an **IOException** (p. 1820). ∗ If an **IOException** (p. 1820) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

Exceptions:

IOException *(*p. ***1820)***

Implements **decaf::io::InputStream** (p. 1742).

Reimplemented in **decaf::io::BufferedInputStream** (p. 812).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.310.3.12 virtual std::size_t decaf::io::FilterInputStream::skip (std::size_t *num*) throw (io::IOException, lang::exceptions::UnsupportedOperationException) [inline, virtual]

Skips over and discards n bytes of data from this input stream. The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned. If n is negative, no bytes are skipped.

The skip method of **InputStream** (p. 1740) creates a byte array and then repeatedly reads into it until n bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters:

num - the number of bytes to skip

Returns:

total butes skipped

Exceptions:

IOException *(*p. ***1820)*** if an error occurs

Implements **decaf::io::InputStream** (p. 1743).

Reimplemented in **decaf::io::BufferedInputStream** (p. 812), and **decaf::io::DataInputStream** (p. 1387).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.310.3.13 virtual bool decaf::io::FilterInputStream::tryLock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3126).

6.310.3.14 virtual void decaf::io::FilterInputStream::unlock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3127).

6.310.3.15 virtual void decaf::io::FilterInputStream::wait (long long *millisecs*, int *nanos*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3128).

6.310.3.16 virtual void decaf::io::FilterInputStream::wait (long long *millisecs*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3130).

6.310.3.17 virtual void decaf::io::FilterInputStream::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3131).

6.311 decaf::io::FilterOutputStream Class Reference

This class is the superclass of all classes that filter output streams.

`#include <src/main/decaf/io/FilterOutputStream.h>`Inheritance diagram for decaf::io::FilterOutputStream:

Public Member Functions

- **FilterOutputStream** (**OutputStream** ∗**outputStream**, bool **own**=false)

  Constructor, creates a wrapped output stream.

- virtual ∼**FilterOutputStream** ()
- virtual void **write** (unsigned char c) throw (IOException)

  Writes a single byte to the output stream.

- virtual void **write** (const std::vector< unsigned char > &buffer) throw (IOException)

  Writes an array of bytes to the output stream.

- virtual void **write** (const unsigned char ∗buffer, std::size_t offset DECAF_UNUSED, std::size_t len) throw (IOException, lang::exceptions::NullPointerException)

  Writes an array of bytes to the output stream.

- virtual void **flush** () throw (IOException)

  Flushes any pending writes in this output stream.

- virtual void **close** () throw (io::IOException)

  Close the Stream.

- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)

  Locks the object.

- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)

  Unlocks the object.

- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals the waiters on this object that it can now wake up and continue.

- bool **own**
- volatile bool **closed**

6.311.1 Detailed Description

This class is the superclass of all classes that filter output streams. These streams sit on top of an already existing output stream (the underlying output stream) which it uses as its basic sink of data, but possibly transforming the data along the way or providing additional functionality.

The class **FilterOutputStream** (p. 1640) itself simply overrides all methods of **OutputStream** (p. 2470) with versions that pass all requests to the underlying output stream. Subclasses of **FilterOutputStream** (p. 1640) may further override some of these methods as well as provide additional methods and fields.

Due to the lack of garbage collection in C++ a design decision was made to add a boolean parameter to the constructor indicating if the wrapped `InputStream (p. 1740)` is owned by this object. That way creation of the underlying stream can occur in a Java like way. Ex:

DataOutputStream (p. 1388) os = new **DataOutputStream** (p. 1388)(new OutputStream(), true)

6.311.2 Constructor & Destructor Documentation

6.311.2.1 decaf::io::FilterOutputStream::FilterOutputStream (OutputStream * *outputStream*, bool *own* = `false`) [inline]

Constructor, creates a wrapped output stream.

Parameters:

outputStream the **OutputStream** (p. 2470) to wrap

own If true, this object will control the lifetime of the output stream that it encapsulates.

6.311.2.2 virtual decaf::io::FilterOutputStream::~FilterOutputStream () [inline, virtual]

References DECAF_CATCH_NOTHROW, and DECAF_CATCHALL_NOTHROW.

6.311.3 Member Function Documentation

6.311.3.1 virtual void decaf::io::FilterOutputStream::close () throw (io::IOException) [inline, virtual]

Close the Stream. The close method of **FilterOutputStream** (p. 1640) calls its flush method, and then calls the close method of its underlying output stream, it then destroys the output stream if it is the owner.

Exceptions:

Exception

Implements **decaf::io::Closeable** (p. 1019).

Reimplemented in **decaf::io::BufferedOutputStream** (p. 815).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.311.3.2 virtual void decaf::io::FilterOutputStream::flush () throw (IOException) [inline, virtual]

Flushes any pending writes in this output stream. The flush method of **FilterOutputStream** (p. 1640) calls the flush method of its underlying output stream

Exceptions:

IOException *(p. 1820)*

Implements **decaf::io::OutputStream** (p. 2470).

Reimplemented in **decaf::io::BufferedOutputStream** (p. 815).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.311.3.3 virtual bool decaf::io::FilterOutputStream::isClosed () const [inline, protected, virtual]

Returns:

true if this stream has been closed.

6.311.3.4 virtual void decaf::io::FilterOutputStream::lock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3123).

6.311.3.5 virtual void decaf::io::FilterOutputStream::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3124).

6.311.3.6 virtual void decaf::io::FilterOutputStream::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3125).

6.311.3.7 virtual bool decaf::io::FilterOutputStream::tryLock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3126).

6.311.3.8 virtual void decaf::io::FilterOutputStream::unlock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3127).

6.311.3.9 virtual void decaf::io::FilterOutputStream::wait (long long *millisecs*, int *nanos*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3128).

6.311.3.10 virtual void decaf::io::FilterOutputStream::wait (long long *millisecs*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3130).

6.311.3.11 virtual void decaf::io::FilterOutputStream::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3131).

6.311.3.12 virtual void decaf::io::FilterOutputStream::write (const unsigned char * *buffer*, std::size_t offset *DECAF_UNUSED*, std::size_t *len*) throw (IOException, lang::exceptions::NullPointerException) [inline, virtual]

Writes an array of bytes to the output stream. The write method of **FilterOutputStream** (p. 1640) calls the write method of one argument on each byte to output.

Parameters:

buffer The array of bytes to write.

offset,the position to start writing in buffer.

len The number of bytes from the buffer to be written.

Exceptions:

IOException *(p. 1820)* thrown if an error occurs.

NullPointerException thrown if buffer is Null.

Implements **decaf::io::OutputStream** (p. 2471).

Reimplemented in **activemq::io::LoggingOutputStream** (p. 2040), **decaf::io::BufferedOutputStream** (p. 815), and **decaf::io::DataOutputStream** (p. 1390).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.311.3.13 virtual void decaf::io::FilterOutputStream::write (const std::vector< unsigned char > & *buffer*) throw (IOException) [inline, virtual]

Writes an array of bytes to the output stream.

Parameters:

buffer The bytes to write.

Exceptions:

IOException *(*p. *1820)* thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 2471).

Reimplemented in **decaf::io::BufferedOutputStream** (p. 816), and **decaf::io::DataOutputStream** (p. 1390).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.311.3.14 virtual void decaf::io::FilterOutputStream::write (unsigned char *c*) throw (IOException) [inline, virtual]

Writes a single byte to the output stream. The write method of **FilterOutputStream** (p. 1640) calls the write method of its underlying output stream, that is, it performs out.write(b).

Parameters:

c the byte.

Exceptions:

IOException *(*p. *1820)* thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 2471).

Reimplemented in **activemq::io::LoggingOutputStream** (p. 2041), **decaf::io::BufferedOutputStream** (p. 816), and **decaf::io::DataOutputStream** (p. 1390).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.312 decaf::lang::Float Class Reference

`#include <src/main/decaf/lang/Float.h>`Inheritance diagram for decaf::lang::Float:

Public Member Functions

- **Float** (float value)
- **Float** (double value)
- **Float** (const std::string &value) throw (exceptions::NumberFormatException)
- virtual ~**Float** ()
- virtual int **compareTo** (const **Float** &f) const

  *Compares this **Float** (p. 1647) instance with another.*

- bool **equals** (const **Float** &f) const
- virtual bool **operator==** (const **Float** &f) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const **Float** &f) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- virtual int **compareTo** (const float &f) const

  *Compares this **Float** (p. 1647) instance with another.*

- bool **equals** (const float &f) const
- virtual bool **operator==** (const float &f) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const float &f) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- std::string **toString** () const
- virtual double **doubleValue** () const

  Answers the double value which the receiver represents.

- virtual float **floatValue** () const

  Answers the float value which the receiver represents.

- virtual unsigned char **byteValue** () const

  Answers the byte value which the receiver represents.

- virtual short **shortValue** () const

  Answers the short value which the receiver represents.

- virtual int **intValue** () const

  Answers the int value which the receiver represents.

- virtual long long **longValue** () const

  Answers the long value which the receiver represents.

- bool **isInfinite** () const
- bool **isNaN** () const

Static Public Member Functions

- static int **compare** (float f1, float f2)

  Compares the two specified double values.

- static int **floatToIntBits** (float value)

  Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "single format" bit layout.

- static int **floatToRawIntBits** (float value)

  Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "single format" bit layout, preserving Not-a-Number (NaN) values.

- static float **intBitsToFloat** (int bits)

  Returns the float value corresponding to a given bit representation.

- static bool **isInfinite** (float value)
- static bool **isNaN** (float value)
- static float **parseFloat** (const std::string &value) throw (exceptions::NumberFormatException)

  *Returns a new float initialized to the value represented by the specified string, as performed by the valueOf method of class **Float** (p. 1647).*

- static std::string **toHexString** (float value)

  Returns a hexadecimal string representation of the float argument.

- static std::string **toString** (float value)

  Returns a string representation of the float argument.

- static **Float valueOf** (float value)

  *Returns a **Float** (p. 1647) instance representing the specified float value.*

- static **Float valueOf** (const std::string &value) throw (exceptions::NumberFormatException)

  *Returns a **Float** (p. 1647) instance that wraps a primtive float which is parsed from the string value passed.*

Static Public Attributes

- static const int **SIZE** = 32

  The size in bits of the primitive int type.

- static const float **MAX_VALUE**

The maximum value that the primitive type can hold.

- static const float **MIN_VALUE**
  The minimum value that the primitive type can hold.
- static const float **NaN**
  *Constant for the Not a **Number** (p. 2432) Value.*
- static const float **POSITIVE_INFINITY**
  Constant for Positive Infinity.
- static const float **NEGATIVE_INFINITY**
  Constant for Negative Infinity.

6.312.1 Constructor & Destructor Documentation

6.312.1.1 decaf::lang::Float::Float (float *value*)

Parameters:

value - the primitive type to wrap

6.312.1.2 decaf::lang::Float::Float (double *value*)

Parameters:

value - the primitive type to wrap

6.312.1.3 decaf::lang::Float::Float (const std::string & *value*) throw (exceptions::NumberFormatException)

Parameters:

value - the string to convert to a primitive type to wrap

6.312.1.4 virtual decaf::lang::Float::~Float () [inline, virtual]

6.312.2 Member Function Documentation

6.312.2.1 virtual unsigned char decaf::lang::Float::byteValue () const [inline, virtual]

Answers the byte value which the receiver represents.

Returns:

byte the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2432).

6.312.2.2 static int decaf::lang::Float::compare (float *f1*, float *f2*) [static]

Compares the two specified double values. The sign of the integer value returned is the same as that of the integer that would be returned by the call: Float(f1).compareTo(Float(f2))

Parameters:

f1 - the first double to compare

f2 - the second double to compare

Returns:

the value 0 if d1 is numerically equal to f2; a value less than 0 if f1 is numerically less than f2; and a value greater than 0 if f1 is numerically greater than f2.

6.312.2.3 virtual int decaf::lang::Float::compareTo (const float & *f*) const [virtual]

Compares this **Float** (p. 1647) instance with another.

Parameters:

f - the **Float** (p. 1647) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object repesents a value less than the passed in value.

Implements **decaf::lang::Comparable< float >** (p. 1083).

6.312.2.4 virtual int decaf::lang::Float::compareTo (const Float & *f*) const [virtual]

Compares this **Float** (p. 1647) instance with another.

Parameters:

f - the **Float** (p. 1647) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable< Float >** (p. 1083).

6.312.2.5 virtual double decaf::lang::Float::doubleValue () const [inline, virtual]

Answers the double value which the receiver represents.

Returns:

double the value of the receiver.

Implements **decaf::lang::Number** (p. 2433).

6.312.2.6 bool decaf::lang::Float::equals (const float & *f*) const [inline, virtual]

Parameters:

f - the **Float** (p. 1647) object to compare against.

Returns:

true if the two **Float** (p. 1647) Objects have the same value.

Implements **decaf::lang::Comparable< float >** (p. 1084).

6.312.2.7 bool decaf::lang::Float::equals (const Float & *f*) const [inline, virtual]

Parameters:

f - the **Float** (p. 1647) object to compare against.

Returns:

true if the two **Float** (p. 1647) Objects have the same value.

Implements **decaf::lang::Comparable< Float >** (p. 1084).

6.312.2.8 static int decaf::lang::Float::floatToIntBits (float *value*) [static]

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "single format" bit layout. Bit 31 (the bit that is selected by the mask 0x80000000) represents the sign of the floating-point number. Bits 30-23 (the bits that are selected by the mask 0x7f800000) represent the exponent. Bits 22-0 (the bits that are selected by the mask 0x007fffff) represent the significand (sometimes called the mantissa) of the floating-point number.

If the argument is positive infinity, the result is 0x7f800000. If the argument is negative infinity, the result is 0xff800000. If the argument is NaN, the result is 0x7fc00000.

In all cases, the result is an integer that, when given to the **intBitsToFloat(int)** (p. 1652) method, will produce a floating-point value the same as the argument to floatToIntBits (except all NaN values are collapsed to a single "canonical" NaN value).

Parameters:

value - the float to convert to int bits

Returns:

the int that holds the float's value

6.312.2.9 static int decaf::lang::Float::floatToRawIntBits (float *value*) [static]

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "single format" bit layout, preserving Not-a-Number (NaN) values. Bit 31 (the bit that is selected by the mask 0x80000000) represents the sign of the floating-point number. Bits 30-23 (the bits that are selected by the mask 0x7f800000) represent the exponent. Bits 22-0 (the bits that are selected by the mask 0x007fffff) represent the significand (sometimes called the mantissa) of the floating-point number.

If the argument is positive infinity, the result is 0x7f800000. If the argument is negative infinity, the result is 0xff800000. If the argument is NaN, the result is the integer representing the actual NaN value. Unlike the floatToIntBits method, intToRawIntBits does not collapse all the bit patterns encoding a NaN to a single "canonical" NaN value.

In all cases, the result is an integer that, when given to the **intBitsToFloat(int)** (p. 1652) method, will produce a floating-point value the same as the argument to floatToRawIntBits.

Parameters:

value The float to convert to a raw int.

Returns:

the raw int value of the float

6.312.2.10 virtual float decaf::lang::Float::floatValue () const [inline, virtual]

Answers the float value which the receiver represents.

Returns:

float the value of the receiver.

Implements **decaf::lang::Number** (p. 2433).

6.312.2.11 static float decaf::lang::Float::intBitsToFloat (int *bits*) [static]

Returns the float value corresponding to a given bit representation. The argument is considered to be a representation of a floating-point value according to the IEEE 754 floating-point "single format" bit layout.

If the argument is 0x7f800000, the result is positive infinity. If the argument is 0xff800000, the result is negative infinity. If the argument is any value in the range 0x7f800001 through 0x7fffffff or in the range 0xff800001 through 0xffffffff, the result is a NaN. No IEEE 754 floating-point operation provided by C++ can distinguish between two NaN values of the same type with different bit patterns. Distinct values of NaN are only distinguishable by use of the **Float::floatToRawIntBits** (p. 1652) method.

Parameters:

bits - the bits of the float encoded as a float

Returns:

a new float created from the int bits.

6.312.2.12 virtual int decaf::lang::Float::intValue () const [inline, virtual]

Answers the int value which the receiver represents.

Returns:

int the value of the receiver.

Implements **decaf::lang::Number** (p. 2433).

6.312.2.13 static bool decaf::lang::Float::isInfinite (float *value*) [static]

Parameters:

value - The float to check.

Returns:

true if the float is equal to infinity.

6.312.2.14 bool decaf::lang::Float::isInfinite () const

Returns:

true if the float is equal to positive infinity.

6.312.2.15 static bool decaf::lang::Float::isNaN (float *value*) [static]

Parameters:

value - The float to check.

Returns:

true if the float is equal to NaN.

6.312.2.16 bool decaf::lang::Float::isNaN () const

Returns:

true if the float is equal to NaN.

6.312.2.17 virtual long long decaf::lang::Float::longValue () const [inline, virtual]

Answers the long value which the receiver represents.

Returns:

long the value of the receiver.

Implements **decaf::lang::Number** (p. 2433).

6.312.2.18 virtual bool decaf::lang::Float::operator< (const float & f) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

f - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< float >** (p. 1084).

6.312.2.19 virtual bool decaf::lang::Float::operator< (const Float & f) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

f - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Float >** (p. 1084).

6.312.2.20 virtual bool decaf::lang::Float::operator== (const float & f) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

f - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< float >** (p. 1085).

6.312.2.21 virtual bool decaf::lang::Float::operator== (const Float & f) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

f - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Float >** (p. 1085).

6.312.2.22 static float decaf::lang::Float::parseFloat (const std::string & *value*) throw (exceptions::NumberFormatException) [static]

Returns a new float initialized to the value represented by the specified string, as performed by the valueOf method of class **Float** (p. 1647).

Parameters:

value - the string to parse

Returns:

a float parsed from the string

Exceptions:

NumberFormatException

6.312.2.23 virtual short decaf::lang::Float::shortValue () const [inline, virtual]

Answers the short value which the receiver represents.

Returns:

short the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2434).

6.312.2.24 static std::string decaf::lang::Float::toHexString (float *value*) [static]

Returns a hexadecimal string representation of the float argument. All characters mentioned below are ASCII characters.

∗ If the argument is NaN, the result is the string "NaN". ∗ Otherwise, the result is a string that represents the sign and magnitude (absolute value) of the argument. If the sign is negative, the first character of the result is '-'; if the sign is positive, no sign character appears in the result. As for the magnitude m: o If m is infinity, it is represented by the string "Infinity"; thus, positive infinity produces the result "Infinity" and negative infinity produces the result "-Infinity". o If m is zero, it is represented by the string "0x0.0p0"; thus, negative zero produces the result "-0x0.0p0" and positive zero produces the result "0x0.0p0". o If m is a float value with a normalized representation, substrings are used to represent the significand and exponent fields. The significand is represented by the characters "0x1." followed by a lowercase hexadecimal representation of the rest of the significand as a fraction. Trailing zeros in the hexadecimal representation are removed unless all the digits are zero, in which case a single zero is used. Next, the exponent is represented by "p" followed by a decimal string of the unbiased exponent as if produced by a call to **Integer.toString** (p. 1774) on the exponent value. o If m is a float value with a subnormal representation, the significand is represented by the characters "0x0." followed by a hexadecimal representation of the rest of the significand as a fraction. Trailing zeros in the

hexadecimal representation are removed. Next, the exponent is represented by "p-126". Note that there must be at least one nonzero digit in a subnormal significand.

Parameters:

value - The float to convert to a string

Returns:

the Hex formatted float string.

6.312.2.25 static std::string decaf::lang::Float::toString (float *value*) [static]

Returns a string representation of the float argument. All characters mentioned below are ASCII characters.

If the argument is NaN, the result is the string "NaN". Otherwise, the result is a string that represents the sign and magnitude (absolute value) of the argument. If the sign is negative, the first character of the result is '-'; if the sign is positive, no sign character appears in the result. As for the magnitude m: o If m is infinity, it is represented by the characters "Infinity"; thus, positive infinity produces the result "Infinity" and negative infinity produces the result "-Infinity". o If m is zero, it is represented by the characters "0.0"; thus, negative zero produces the result "-0.0" and positive zero produces the result "0.0". o If m is greater than or equal to 10-3 but less than 107, then it is represented as the integer part of m, in decimal form with no leading zeroes, followed by '.', followed by one or more decimal digits representing the fractional part of m. o If m is less than 10-3 or greater than or equal to 107, then it is represented in so-called "computerized scientific notation." Let n be the unique integer such that 10n <= m < 10n+1; then let a be the mathematically exact quotient of m and 10n so that 1 <= a < 10. The magnitude is then represented as the integer part of a, as a single decimal digit, followed by '.', followed by decimal digits representing the fractional part of a, followed by the letter 'E', followed by a representation of n as a decimal integer, as produced by the method **Integer.toString(int)** (p. 1774).

Parameters:

value - The float to convert to a string

Returns:

the formatted float string.

6.312.2.26 std::string decaf::lang::Float::toString () const

Returns:

this **Float** (p. 1647) Object as a String Representation

6.312.2.27 static Float decaf::lang::Float::valueOf (const std::string & *value*) throw (exceptions::NumberFormatException) [static]

Returns a **Float** (p. 1647) instance that wraps a primtive float which is parsed from the string value passed.

Parameters:

value - the string to parse

Returns:

a new **Float** (p. 1647) instance wrapping the float parsed from value

Exceptions:

NumberFormatException on error.

6.312.2.28 static Float decaf::lang::Float::valueOf (float *value*) [static]

Returns a **Float** (p. 1647) instance representing the specified float value.

Parameters:

value - float to wrap

Returns:

new **Float** (p. 1647) instance wrapping the primitive value

6.312.3 Field Documentation

6.312.3.1 const float decaf::lang::Float::MAX_VALUE [static]

The maximum value that the primitive type can hold.

6.312.3.2 const float decaf::lang::Float::MIN_VALUE [static]

The minimum value that the primitive type can hold.

6.312.3.3 const float decaf::lang::Float::NaN [static]

Constant for the Not a **Number** (p. 2432) Value.

6.312.3.4 const float decaf::lang::Float::NEGATIVE_INFINITY [static]

Constant for Negative Infinity.

6.312.3.5 const float decaf::lang::Float::POSITIVE_INFINITY [static]

Constant for Positive Infinity.

6.312.3.6 const int decaf::lang::Float::SIZE = 32 [static]

The size in bits of the primitive int type.

6.313 decaf::internal::nio::FloatArrayBuffer Class Reference

`#include <src/main/decaf/internal/nio/FloatArrayBuffer.h>`Inheritance diagram for decaf::internal::nio::FloatArrayBuffer:

Public Member Functions

- **FloatArrayBuffer** (std::size_t capacity, bool readOnly=false)

  *Creates a **FloatArrayBuffer** (p. 1658) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

- **FloatArrayBuffer** (float *array, std::size_t offset, std::size_t capacity, bool readOnly=false) throw (decaf::lang::exceptions::NullPointerException)

  *Creates a **FloatArrayBuffer** (p. 1658) object that wraps the given array.*

- **FloatArrayBuffer** (**ByteArrayPerspective** &array, std::size_t offset, std::size_t capacity, bool readOnly=false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

  *Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 908) and start at the given offset.*

- **FloatArrayBuffer** (const **FloatArrayBuffer** &other)

  *Create a **FloatArrayBuffer** (p. 1658) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 908) and when changes are made to that data it is reflected in both.*

- virtual ~**FloatArrayBuffer** ()
- virtual float * **array** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)

  Returns the float array that backs this buffer (optional operation).

- virtual std::size_t **arrayOffset** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

- virtual FloatBuffer * **asReadOnlyBuffer** () const

  Creates a new, read-only float buffer that shares this buffer's content.

- virtual FloatBuffer & **compact** () throw (decaf::nio::ReadOnlyBufferException)

  Compacts this buffer.

- virtual FloatBuffer * **duplicate** ()

  Creates a new float buffer that shares this buffer's content.

- virtual float **get** () throw (decaf::nio::BufferUnderflowException)

  Relative get method.

- virtual float **get** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)

Absolute get method.

- virtual bool **hasArray** () const

  Tells whether or not this buffer is backed by an accessible float array.

- virtual bool **isReadOnly** () const

  Tells whether or not this buffer is read-only.

- virtual FloatBuffer & **put** (float value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

  Writes the given doubles into this buffer at the current position, and then increments the position.

- virtual FloatBuffer & **put** (std::size_t index, float value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)

  Writes the given doubles into this buffer at the given index.

- virtual FloatBuffer * **slice** () const

  Creates a new FloatBuffer whose content is a shared subsequence of this buffer's content.

Protected Member Functions

- virtual void **setReadOnly** (bool value)

  *Sets this **ByteArrayBuffer** (p. 870) as Read-Only.*

6.313.1 Constructor & Destructor Documentation

6.313.1.1 decaf::internal::nio::FloatArrayBuffer::FloatArrayBuffer (std::size_t *capacity*, bool *readOnly* = `false`)

Creates a **FloatArrayBuffer** (p. 1658) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

6.313.1.2 decaf::internal::nio::FloatArrayBuffer::FloatArrayBuffer (float * *array*, std::size_t *offset*, std::size_t *capacity*, bool *readOnly* = `false`) throw (decaf::lang::exceptions::NullPointerException)

Creates a **FloatArrayBuffer** (p. 1658) object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

offset - the position that is this buffers start pos.

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

Exceptions:

NullPointerException if buffer is NULL

6.313.1.3 decaf::internal::nio::FloatArrayBuffer::FloatArrayBuffer (ByteArrayPerspective & *array*, std::size_t *offset*, std::size_t *capacity*, bool *readOnly* = `false`) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 908) and start at the given offset. The capacity and limit of the new **FloatArrayBuffer** (p. 1658) will be that of the remaining capacity of the passed buffer.

Parameters:

array - the **ByteArrayPerspective** (p. 908) to wrap

offset - the offset into array where the buffer starts

capacity - the length of the array we are wrapping or limit.

readOnly - is this a readOnly buffer.

Exceptions:

IndexOutOfBoundsException if offset is greater than array capacity.

6.313.1.4 decaf::internal::nio::FloatArrayBuffer::FloatArrayBuffer (const FloatArrayBuffer & *other*)

Create a **FloatArrayBuffer** (p. 1658) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 908) and when changes are made to that data it is reflected in both.

Parameters:

other - the **FloatArrayBuffer** (p. 1658) this one is to mirror.

6.313.1.5 virtual decaf::internal::nio::FloatArrayBuffer::~FloatArrayBuffer () `[virtual]`

6.313.2 Member Function Documentation

6.313.2.1 virtual float* decaf::internal::nio::FloatArrayBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) `[virtual]`

Returns the float array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this Buffer

Exceptions:

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::FloatBuffer** (p. 1667).

6.313.2.2 virtual std::size_t decaf::internal::nio::FloatArrayBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::FloatBuffer** (p. 1668).

6.313.2.3 virtual FloatBuffer* decaf::internal::nio::FloatArrayBuffer::asReadOnlyBuffer () const [virtual]

Creates a new, read-only float buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only float buffer which the caller then owns.

Implements **decaf::nio::FloatBuffer** (p. 1668).

6.313.2.4 virtual FloatBuffer& decaf::internal::nio::FloatArrayBuffer::compact () throw (decaf::nio::ReadOnlyBufferException) [virtual]

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 807) is copied

to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 807) - 1 is copied to index n = **limit()** (p. 807) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this FloatBuffer

Exceptions:

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::FloatBuffer** (p. 1668).

6.313.2.5 virtual FloatBuffer* decaf::internal::nio::FloatArrayBuffer::duplicate () [virtual]

Creates a new float buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new float Buffer which the caller owns.

Implements **decaf::nio::FloatBuffer** (p. 1669).

6.313.2.6 virtual float decaf::internal::nio::FloatArrayBuffer::get (std::size_t *index*) const throw (lang::exceptions::IndexOutOfBoundsException) [virtual]

Absolute get method. Reads the value at the given index.

Parameters:

index - the index in the Buffer where the float is to be read

Returns:

the float that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implements **decaf::nio::FloatBuffer** (p. 1670).

6.313.2.7 virtual float decaf::internal::nio::FloatArrayBuffer::get () throw (decaf::nio::BufferUnderflowException) [virtual]

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the float at the current position

Exceptions:

BufferUnderflowException if there no more data to return

Implements **decaf::nio::FloatBuffer** (p. 1671).

6.313.2.8 virtual bool decaf::internal::nio::FloatArrayBuffer::hasArray () const [inline, virtual]

Tells whether or not this buffer is backed by an accessible float array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implements **decaf::nio::FloatBuffer** (p. 1671).

6.313.2.9 virtual bool decaf::internal::nio::FloatArrayBuffer::isReadOnly () const [inline, virtual]

Tells whether or not this buffer is read-only.

Returns:

true if, and only if, this buffer is read-only

Implements **decaf::nio::Buffer** (p. 806).

6.313.2.10 virtual FloatBuffer& decaf::internal::nio::FloatArrayBuffer::put (std::size_t *index*, float *value*) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException) [virtual]

Writes the given doubles into this buffer at the given index.

Parameters:

index - position in the Buffer to write the data

value - the doubles to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::FloatBuffer** (p. 1672).

6.313.2.11 virtual FloatBuffer& decaf::internal::nio::FloatArrayBuffer::put (float *value*) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException) [virtual]

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters:

value - the doubles value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::FloatBuffer** (p. 1672).

6.313.2.12 virtual void decaf::internal::nio::FloatArrayBuffer::setReadOnly (bool *value*) [inline, protected, virtual]

Sets this **ByteArrayBuffer** (p. 870) as Read-Only.

Parameters:

value - true if this buffer is to be read-only.

6.313.2.13 virtual FloatBuffer* decaf::internal::nio::FloatArrayBuffer::slice () const [virtual]

Creates a new FloatBuffer whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create FloatBuffer which the caller owns.

Implements **decaf::nio::FloatBuffer** (p. 1674).

The documentation for this class was generated from the following file:

Public Member Functions

- virtual ~**FloatBuffer** ()
- virtual std::string **toString** () const
- virtual float * **array** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)

  Returns the float array that backs this buffer (optional operation).

- virtual std::size_t **arrayOffset** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

- virtual **FloatBuffer** * **asReadOnlyBuffer** () const =0

  Creates a new, read-only float buffer that shares this buffer's content.

- virtual **FloatBuffer** & **compact** ()=0 throw (ReadOnlyBufferException)

  Compacts this buffer.

- virtual **FloatBuffer** * **duplicate** ()=0

  Creates a new float buffer that shares this buffer's content.

- virtual float **get** ()=0 throw (BufferUnderflowException)

  Relative get method.

- virtual float **get** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)

  Absolute get method.

- **FloatBuffer** & **get** (std::vector< float > buffer) throw (BufferUnderflowException)

  Relative bulk get method.

- **FloatBuffer** & **get** (float *buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)

  Relative bulk get method.

- virtual bool **hasArray** () const =0

  Tells whether or not this buffer is backed by an accessible float array.

- **FloatBuffer** & **put** (**FloatBuffer** &src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)

  This method transfers the floats remaining in the given source buffer into this buffer.

- **FloatBuffer** & **put** (const float *buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)

  This method transfers floats into this buffer from the given source array.

- **FloatBuffer** & **put** (std::vector< float > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)

  This method transfers the entire content of the given source floats array into this buffer.

- virtual **FloatBuffer** & **put** (float value)=0 throw (BufferOverflowException, ReadOnlyBufferException)

  Writes the given floats into this buffer at the current position, and then increments the position.

- virtual **FloatBuffer** & **put** (std::size_t index, float value)=0 throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)

  Writes the given floats into this buffer at the given index.

  *Wraps the passed STL float Vector in a **FloatBuffer** (p. 1665).*

Protected Member Functions

- **FloatBuffer** (std::size_t capacity)

  *Creates a **FloatBuffer** (p. 1665) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.314.1 Detailed Description

This class defines four categories of operations upon float buffers:. o Absolute and relative get and put methods that read and write single floats; o Relative bulk get methods that transfer contiguous sequences of floats from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of floats from a float array or some other float buffer into this buffer o Methods for compacting, duplicating, and slicing a float buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing float array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.314.2 Constructor & Destructor Documentation

6.314.2.1 decaf::nio::FloatBuffer::FloatBuffer (std::size_t *capacity*) [protected]

Creates a **FloatBuffer** (p. 1665) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size and limit of the **Buffer** (p. 803) in doubles

6.314.2.2 virtual decaf::nio::FloatBuffer::~FloatBuffer () [inline, virtual]

6.314.3 Member Function Documentation

6.314.3.1 static FloatBuffer* decaf::nio::FloatBuffer::allocate (std::size_t *capacity*) [static]

Allocates a new Double buffer. The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters:

capacity - The size of the Double buffer in floats

Returns:

the **FloatBuffer** (p. 1665) that was allocated, caller owns.

6.314.3.2 virtual float* decaf::nio::FloatBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]

Returns the float array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this **Buffer** (p. 803)

Exceptions:

ReadOnlyBufferException *(p. 2685)* if this **Buffer** (p. 803) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1660).

6.314.3.3 virtual std::size_t decaf::nio::FloatBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException *(p. 2685)* if this **Buffer** (p. 803) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1661).

6.314.3.4 virtual FloatBuffer* decaf::nio::FloatBuffer::asReadOnlyBuffer () const [pure virtual]

Creates a new, read-only float buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only float buffer which the caller then owns.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1661).

6.314.3.5 virtual FloatBuffer& decaf::nio::FloatBuffer::compact () throw (ReadOnlyBufferException) [pure virtual]

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 807) is copied

to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 807) - 1 is copied to index n = **limit()** (p. 807) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **FloatBuffer** (p. 1665)

Exceptions:

ReadOnlyBufferException *(p. 2685)* - If this buffer is read-only

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1661).

6.314.3.6 virtual int decaf::nio::FloatBuffer::compareTo (const FloatBuffer & *value*) const [virtual]

Compares this object with the specified object for order. Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Parameters:

value - the Object to be compared.

Returns:

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

6.314.3.7 virtual FloatBuffer* decaf::nio::FloatBuffer::duplicate () [pure virtual]

Creates a new float buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new float **Buffer** (p. 803) which the caller owns.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1662).

6.314.3.8 virtual bool decaf::nio::FloatBuffer::equals (const FloatBuffer & *value*) const [virtual]

Returns:

true if this value is considered equal to the passed value.

6.314.3.9 FloatBuffer& decaf::nio::FloatBuffer::get (float * *buffer*, std::size_t *offset*, std::size_t *length*) throw (BufferUnderflowException, lang::exceptions::NullPointerException)

Relative bulk get method. This method transfers floats from this buffer into the given destination array. If there are fewer floats remaining in the buffer than are required to satisfy the request, that is, if length > **remaining()** (p. 808), then no bytes are transferred and a **BufferUnderflowException** (p. 837) is thrown.

Otherwise, this method copies length floats from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters:

buffer - pointer to an allocated buffer to fill

offset - position in the buffer to start filling

length - amount of data to put in the passed buffer

Returns:

a reference to this **Buffer** (p. 803)

Exceptions:

BufferUnderflowException *(p. 837)* - If there are fewer than length floats remaining in this buffer

NullPointerException if the passed buffer is null.

6.314.3.10 FloatBuffer& decaf::nio::FloatBuffer::get (std::vector< float > *buffer*) throw (BufferUnderflowException)

Relative bulk get method. This method transfers values from this buffer into the given destination vector. An invocation of this method of the form src.get(a) behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call buffer.resize(N) before calling this get method.

Returns:

a reference to this **Buffer** (p. 803)

Exceptions:

BufferUnderflowException *(p. 837)* - If there are fewer than length floats remaining in this buffer

6.314.3.11 virtual float decaf::nio::FloatBuffer::get (std::size_t *index*) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Absolute get method. Reads the value at the given index.

Parameters:

index - the index in the **Buffer** (p. 803) where the float is to be read

Returns:

the float that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1662).

6.314.3.12 virtual float decaf::nio::FloatBuffer::get () throw (BufferUnderflowException) [pure virtual]

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the float at the current position

Exceptions:

BufferUnderflowException *(*p. ***837)*** if there no more data to return

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1662).

6.314.3.13 virtual bool decaf::nio::FloatBuffer::hasArray () const [pure virtual]

Tells whether or not this buffer is backed by an accessible float array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1663).

6.314.3.14 virtual bool decaf::nio::FloatBuffer::operator< (const FloatBuffer & *value*) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.314.3.15 virtual bool decaf::nio::FloatBuffer::operator== (const FloatBuffer & *value*) const [virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.314.3.16 virtual FloatBuffer& decaf::nio::FloatBuffer::put (std::size_t *index*, float *value*) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException) [pure virtual]

Writes the given floats into this buffer at the given index.

Parameters:

index - position in the **Buffer** (p. 803) to write the data

value - the floats to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException *(p. 2685)* - If this buffer is read-only

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1663).

6.314.3.17 virtual FloatBuffer& decaf::nio::FloatBuffer::put (float *value*) throw (BufferOverflowException, ReadOnlyBufferException) [pure virtual]

Writes the given floats into this buffer at the current position, and then increments the position.

Parameters:

value - the floats value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException *(p. 834)* - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException *(p. 2685)* - If this buffer is read-only

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1664).

6.314.3.18 FloatBuffer& decaf::nio::FloatBuffer::put (std::vector< float > & *buffer*) throw (BufferOverflowException, ReadOnlyBufferException)

This method transfers the entire content of the given source floats array into this buffer. This is the same as calling put(&buffer[0], 0, buffer.size()

Parameters:

buffer - The buffer whose contents are copied to this **FloatBuffer** (p. 1665)

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. ***834***) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. ***2685***) - If this buffer is read-only

6.314.3.19 FloatBuffer& decaf::nio::FloatBuffer::put (const float * *buffer*, std::size_t *offset*, std::size_t *length*) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)

This method transfers floats into this buffer from the given source array. If there are more floats to be copied from the array than remain in this buffer, that is, if length > **remaining()** (p. 808), then no floats are transferred and a **BufferOverflowException** (p. 834) is thrown.

Otherwise, this method copies length bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by length.

Parameters:

buffer- The array from which floats are to be read

offset- The offset within the array of the first float to be read;

length - The number of floats to be read from the given array

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. ***834***) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. ***2685***) - If this buffer is read-only

NullPointerException if the passed buffer is null.

6.314.3.20 FloatBuffer& decaf::nio::FloatBuffer::put (FloatBuffer & *src*) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)

This method transfers the floats remaining in the given source buffer into this buffer. If there are more floats remaining in the source buffer than in this buffer, that is, if src.remaining() >

remaining() (p. 808), then no floats are transferred and a **BufferOverflowException** (p. 834) is thrown.

Otherwise, this method copies n = src.remaining() floats from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by n.

Parameters:

src - the buffer to take floats from an place in this one.

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException *(p. 834)* - If there is insufficient space in this buffer for the remaining floats in the source buffer

IllegalArgumentException - If the source buffer is this buffer

ReadOnlyBufferException *(p. 2685)* - If this buffer is read-only

6.314.3.21 virtual FloatBuffer* decaf::nio::FloatBuffer::slice () const [pure virtual]

Creates a new **FloatBuffer** (p. 1665) whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **FloatBuffer** (p. 1665) which the caller owns.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1664).

6.314.3.22 virtual std::string decaf::nio::FloatBuffer::toString () const [virtual]

Returns:

a std::string describing this object

6.314.3.23 static FloatBuffer* decaf::nio::FloatBuffer::wrap (std::vector< float > & *buffer*) [static]

Wraps the passed STL float Vector in a **FloatBuffer** (p. 1665). The new buffer will be backed by the given float array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns:

a new **FloatBuffer** (p. 1665) that is backed by buffer, caller owns.

6.314.3.24 static FloatBuffer* decaf::nio::FloatBuffer::wrap (float * *array*, std::size_t *offset*, std::size_t *length*) throw (lang::exceptions::NullPointerException) [static]

Wraps the passed buffer with a new **FloatBuffer** (p. 1665). The new buffer will be backed by the given float array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

array - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns:

a new **FloatBuffer** (p. 1665) that is backed by buffer, caller owns.

6.315 activemq::commands::FlushCommand Class Reference

`#include <src/main/activemq/commands/FlushCommand.h>`Inheritance diagram for activemq::commands::FlushCommand:

Public Member Functions

- **FlushCommand** ()
- virtual ~**FlushCommand** ()
- virtual unsigned char **getDataStructureType** () const

  Get the unique identifier that this object and its own Marshaler share.

- virtual **FlushCommand** * **cloneDataStructure** () const

  Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

  Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure*** (p. *1461) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure*** (p. *1461) passed in to this one, and returns if they are equivalent.*

- virtual **Pointer**< **Command** > **visit** (**activemq::state::CommandVisitor** *visitor) throw (exceptions::ActiveMQException)

  Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_FLUSHCOMMAND** = 15

Protected Member Functions

- **FlushCommand** (const **FlushCommand** &)
- **FlushCommand** & **operator**= (const **FlushCommand** &)

6.315.1 Constructor & Destructor Documentation

6.315.1.1 activemq::commands::FlushCommand::FlushCommand (const FlushCommand &) [inline, protected]

6.315.1.2 activemq::commands::FlushCommand::FlushCommand ()

6.315.1.3 virtual activemq::commands::FlushCommand::~FlushCommand () [virtual]

6.315.2 Member Function Documentation

6.315.2.1 virtual FlushCommand* activemq::commands::FlushCommand::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.315.2.2 virtual void activemq::commands::FlushCommand::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.315.2.3 virtual bool activemq::commands::FlushCommand::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.315.2.4 virtual unsigned char activemq::commands::FlushCommand::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.315.2.5 FlushCommand& activemq::commands::FlushCommand::operator= (const FlushCommand &) [inline, protected]

6.315.2.6 virtual std::string activemq::commands::FlushCommand::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 655).

6.315.2.7 virtual Pointer<Command> activemq::commands::FlushCommand::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1067).

6.315.3 Field Documentation

  Write a object instance to data output stream.

6.316.1 Detailed Description

Marshaling code for Open Wire Format for **FlushCommandMarshaller** (p. 1679). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.316.2 Constructor & Destructor Documentation

6.316.2.1 activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::FlushCommandM () [inline]

6.316.2.2 virtual activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::~FlushCommand () [inline, virtual]

6.316.3 Member Function Documentation

6.316.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.316.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::getDataStructureT () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.316.3.3 virtual void activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 686).

6.316.3.4 virtual void activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 687).

6.316.3.5 virtual int activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 688).

6.316.3.6 virtual void activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 689).

6.316.3.7 virtual void activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 690).

6.317.2.2 virtual activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::~FlushCommand () [inline, virtual]

6.317.3 Member Function Documentation

6.317.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.317.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::getDataStructureT () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.317.3.3 virtual void activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 665).

6.317.3.4 virtual void activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 666).

6.317.3.5 virtual int activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 667).

6.317.3.6 virtual void activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 668).

6.317.3.7 virtual void activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 669).

The documentation for this class was generated from the following file:

6.318 activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller Class Reference

Marshaling code for Open Wire Format for **FlushCommandMarshaller** (p. 1687).

`#include <src/main/activemq/wireformat/openwire/marshal/v3/FlushCommandMarshaller.h>`Inheritance diagram for activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller:

Public Member Functions

- **FlushCommandMarshaller** ()
- virtual ~**FlushCommandMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.318.1 Detailed Description

Marshaling code for Open Wire Format for **FlushCommandMarshaller** (p. 1687). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.318.2 Constructor & Destructor Documentation

6.318.2.1 activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::FlushCommandM () [inline]

6.318.2.2 virtual activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::~FlushCommand () [inline, virtual]

6.318.3 Member Function Documentation

6.318.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.318.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::getDataStructureT () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.318.3.3 virtual void activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 658).

6.318.3.4 virtual void activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 659).

6.318.3.5 virtual int activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 660).

6.318.3.6 virtual void activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 661).

6.318.3.7 virtual void activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 662).

6.319.3 Member Function Documentation

6.319.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.319.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller::getDataStructureT () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.319.3.3 virtual void activemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 672).

6.319.3.4 virtual void activemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 673).

6.319.3.5 virtual int activemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 674).

6.319.3.6 virtual void activemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 675).

6.319.3.7 virtual void activemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 676).

6.320.3 Member Function Documentation

6.320.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::FlushCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.320.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::FlushCommandMarshaller::getDataStructureT () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.320.3.3 virtual void activemq::wireformat::openwire::marshal::v5::FlushCommandMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 679).

6.320.3.4 virtual void activemq::wireformat::openwire::marshal::v5::FlushCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 680).

6.320.3.5 virtual int activemq::wireformat::openwire::marshal::v5::FlushCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 681).

6.320.3.6 virtual void activemq::wireformat::openwire::marshal::v5::FlushCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 682).

6.320.3.7 virtual void activemq::wireformat::openwire::marshal::v5::FlushCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 683).

The documentation for this class was generated from the following file:

6.321 decaf::util::logging::Formatter Class Reference

A **Formatter** (p. 1699) provides support for formatting LogRecords.

`#include <src/main/decaf/util/logging/Formatter.h>`Inheritance diagram for decaf::util::logging::Formatter:

Public Member Functions

- virtual ~**Formatter** ()
- virtual std::string **format** (const **LogRecord** &record) const =0

  Format the given log record and return the formatted string.
- virtual std::string **formatMessage** (const **LogRecord** &record) const =0

  Format the message string from a log record.
- virtual std::string **getHead** (const **Handler** *handler)=0

  Return the header string for a set of formatted records.
- virtual std::string **getTail** (const **Handler** *handler)=0

  Return the tail string for a set of formatted records.

6.321.1 Detailed Description

A **Formatter** (p. 1699) provides support for formatting LogRecords. Typically each logging **Handler** (p. 1709) will have a **Formatter** (p. 1699) associated with it. The **Formatter** (p. 1699) takes a **LogRecord** (p. 2050) and converts it to a string.

Some formatters (such as the XMLFormatter) need to wrap head and tail strings around a set of formatted records. The getHeader and getTail methods can be used to obtain these strings.

6.321.2 Constructor & Destructor Documentation

6.321.2.1 virtual decaf::util::logging::Formatter::~Formatter () `[inline, virtual]`

6.321.3 Member Function Documentation

6.321.3.1 virtual std::string decaf::util::logging::Formatter::format (const LogRecord & *record*) const `[pure virtual]`

Format the given log record and return the formatted string.

Parameters:

record The Log Record to Format

Returns:

the formatted record.

Implemented in **decaf::util::logging::SimpleFormatter** (p. 2960).

6.321.3.2 virtual std::string decaf::util::logging::Formatter::formatMessage (const LogRecord & *record*) const [pure virtual]

Format the message string from a log record.

Parameters:

record The Log Record to Format

Returns:

the formatted message

Implemented in **decaf::util::logging::SimpleFormatter** (p. 2961).

6.321.3.3 virtual std::string decaf::util::logging::Formatter::getHead (const Handler * *handler*) [pure virtual]

Return the header string for a set of formatted records. In the default implementation this method should return empty string

Parameters:

handler the target handler, can be null

Returns:

the head string

Implemented in **decaf::util::logging::SimpleFormatter** (p. 2961).

6.321.3.4 virtual std::string decaf::util::logging::Formatter::getTail (const Handler * *handler*) [pure virtual]

Return the tail string for a set of formatted records. In the default implementation this method should return empty string

Parameters:

handler the target handler, can be null

Returns:

the tail string

Implemented in **decaf::util::logging::SimpleFormatter** (p. 2961).

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**Formatter.h**

6.322 decaf::util::concurrent::Future< V > Class Template Reference

A **Future** (p. 1701) represents the result of an asynchronous computation.

`#include <src/main/decaf/util/concurrent/Future.h>`

Public Member Functions

- virtual ~**Future** ()
- bool **cancel** (bool mayInterruptIfRunning)=0

  Attempts to cancel execution of this task.

- bool **isCancelled** () const =0

  Returns true if this task was canceled before it completed normally.

- bool **isDone** () const =0

  Returns true if this task completed.

- V **get** ()=0 throw (CancellationException, InterruptedException, ExecutionException)

  Waits if necessary for the computation to complete, and then retrieves its result.

- V **get** (long long timeout, **TimeUnit** unit)=0 throw (InterruptedException, ExecutionException, TimeoutException)

  Waits if necessary for at most the given time for the computation to complete, and then retrieves its result, if available.

6.322.1 Detailed Description

template<typename V> class decaf::util::concurrent::Future< V >

A **Future** (p. 1701) represents the result of an asynchronous computation. Methods are provided to check if the computation is complete, to wait for its completion, and to retrieve the result of the computation. The result can only be retrieved using method get when the computation has completed, blocking if necessary until it is ready. Cancellation is performed by the cancel method. Additional methods are provided to determine if the task completed normally or was canceled. Once a computation has completed, the computation cannot be canceled. If you would like to use a **Future** (p. 1701) for the sake of cancellability but not provide a usable result, you can declare types of the form Future<void*> and return null as a result of the underlying task.

6.322.2 Constructor & Destructor Documentation

6.322.2.1 template<typename V > virtual decaf::util::concurrent::Future< V >::~Future () [inline, virtual]

6.322.3 Member Function Documentation

6.322.3.1 template<typename V > bool decaf::util::concurrent::Future< V >::cancel (bool *mayInterruptIfRunning*) [pure virtual]

Attempts to cancel execution of this task. This attempt will fail if the task has already completed, has already been canceled, or could not be canceled for some other reason. If successful, and this task has not started when cancel is called, this task should never run. If the task has already started, then the mayInterruptIfRunning parameter determines whether the thread executing this task should be interrupted in an attempt to stop the task.

After this method returns, subsequent calls to **isDone()** (p. 1703) will always return true. Subsequent calls to **isCancelled()** (p. 1703) will always return true if this method returned true.

Parameters:

mayInterruptIfRunning - true if the thread executing this task should be interrupted; otherwise, in-progress tasks are allowed to complete.

Returns:

false if the task could not be canceled, typically because it has already completed normally; true otherwise

6.322.3.2 template<typename V > V decaf::util::concurrent::Future< V >::get (long long *timeout*, TimeUnit *unit*) throw (InterruptedException, ExecutionException, TimeoutException) [pure virtual]

Waits if necessary for at most the given time for the computation to complete, and then retrieves its result, if available.

Parameters:

timeout - the maximum time to wait

unit - the time unit of the timeout argument

Returns:

the computed result

Exceptions:

CancellationException (p. ***965***) - if the computation was canceled

ExecutionException (p. ***1605***) - if the computation threw an exception

InterruptedException - if the current thread was interrupted while waiting

TimeoutException (p. ***3185***) - if the wait timed out

6.322.3.3 template<typename V > V decaf::util::concurrent::Future< V >::get () throw (CancellationException, InterruptedException, ExecutionException) [pure virtual]

Waits if necessary for the computation to complete, and then retrieves its result.

Returns:

the computed result.

Exceptions:

CancellationException *(*p. ***965)*** - if the computation was canceled

ExecutionException *(*p. ***1605)*** - if the computation threw an exception

InterruptedException - if the current thread was interrupted while waiting

6.322.3.4 template<typename V > bool decaf::util::concurrent::Future< V >::isCancelled () const [pure virtual]

Returns true if this task was canceled before it completed normally.

Returns:

true if this task was canceled before it completed

6.322.3.5 template<typename V > bool decaf::util::concurrent::Future< V >::isDone () const [pure virtual]

Returns true if this task completed. Completion may be due to normal termination, an exception, or cancellation -- in all of these cases, this method will return true.

Returns:

true if this task completed

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**Future.h**

6.323 activemq::transport::correlator::FutureResponse Class Reference

A container that holds a response object.

`#include <src/main/activemq/transport/correlator/FutureResponse.h>`

Public Member Functions

- **FutureResponse** ()
- virtual ~**FutureResponse** ()
- virtual const **Pointer**< **Response** > & **getResponse** () const

  Getters for the response property.

- virtual **Pointer**< **Response** > & **getResponse** ()
- virtual const **Pointer**< **Response** > & **getResponse** (unsigned int timeout) const

  Getters for the response property.

- virtual **Pointer**< **Response** > & **getResponse** (unsigned int timeout)
- virtual void **setResponse** (const **Pointer**< **Response** > &response)

  Setter for the response property.

6.323.1 Detailed Description

A container that holds a response object. Callers of the getResponse method will block until a response has been receive unless they call the getRepsonse that takes a timeout.

6.323.2 Constructor & Destructor Documentation

6.323.2.1 activemq::transport::correlator::FutureResponse::FutureResponse () [inline]

6.323.2.2 virtual activemq::transport::correlator::FutureResponse::~FutureResponse () [inline, virtual]

6.323.3 Member Function Documentation

6.323.3.1 virtual Pointer<Response>& activemq::transport::correlator::FutureResponse::getResponse (unsigned int *timeout*) [inline, virtual]

6.323.3.2 virtual const Pointer<Response>& activemq::transport::correlator::FutureResponse::getResponse (unsigned int *timeout*) const [inline, virtual]

Getters for the response property. Timed Wait.

Parameters:

timeout - time to wait in milliseconds

Returns:

the response object for the request

6.323.3.3 virtual Pointer<Response>& activemq::transport::correlator::FutureResponse::getResponse () [inline, virtual]

6.323.3.4 virtual const Pointer<Response>& activemq::transport::correlator::FutureResponse::getResponse () const [inline, virtual]

Getters for the response property. Infinite Wait.

Returns:

the response object for the request

6.323.3.5 virtual void activemq::transport::correlator::FutureResponse::setResponse (const Pointer< Response > & *response*) [inline, virtual]

Setter for the response property.

Parameters:

response the response object for the request.

The documentation for this class was generated from the following file:

- src/main/activemq/transport/correlator/**FutureResponse.h**

6.324 decaf::security::GeneralSecurityException Class Reference

`#include <src/main/decaf/security/GeneralSecurityException.h>`Inheritance diagram for decaf::security::GeneralSecurityException:

Public Member Functions

- **GeneralSecurityException** () throw ()
  Default Constructor.
- **GeneralSecurityException** (const Exception &ex) throw ()
  Conversion Constructor from some other Exception.
- **GeneralSecurityException** (const **GeneralSecurityException** &ex) throw ()
  Copy Constructor.
- **GeneralSecurityException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- **GeneralSecurityException** (const std::exception *cause) throw ()
  Constructor.
- **GeneralSecurityException** (const char *file, const int lineNumber, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **GeneralSecurityException** * **clone** () const
  Clones this exception.
- virtual ~**GeneralSecurityException** () throw ()

6.324.1 Constructor & Destructor Documentation

6.324.1.1 decaf::security::GeneralSecurityException::GeneralSecurityException () throw () [inline]

Default Constructor.

6.324.1.2 decaf::security::GeneralSecurityException::GeneralSecurityException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.324.1.3 decaf::security::GeneralSecurityException::GeneralSecurityException (const GeneralSecurityException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.324.1.4 decaf::security::GeneralSecurityException::GeneralSecurityException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.324.1.5 decaf::security::GeneralSecurityException::GeneralSecurityException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.324.1.6 decaf::security::GeneralSecurityException::GeneralSecurityException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.324.1.7 virtual decaf::security::GeneralSecurityException::~GeneralSecurityException () throw () [inline, virtual]

6.324.2 Member Function Documentation

6.324.2.1 virtual GeneralSecurityException* decaf::security::GeneralSecurityException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented in **decaf::security::cert::CertificateEncodingException** (p. 973), **decaf::security::cert::CertificateException** (p. 975), **decaf::security::cert::CertificateExpiredException** (p. 977), **decaf::security::cert::CertificateNotYetValidException** (p. 979), **decaf::security::cert::CertificateParsingException** (p. 981), **decaf::security::InvalidKeyException** (p. 1812), **decaf::security::KeyException** (p. 1957), **decaf::security::NoSuchAlgorithmException** (p. 2422), **decaf::security::NoSuchProviderException** (p. 2428), and **decaf::security::SignatureException** (p. 2959).

The documentation for this class was generated from the following file:

- src/main/decaf/security/**GeneralSecurityException.h**

6.325 decaf::util::logging::Handler Class Reference

A **Handler** (p. 1709) object takes log messages from a **Logger** (p. 2028) and exports them.

`#include <src/main/decaf/util/logging/Handler.h>`Inheritance diagram for decaf::util::logging::Handler:

Public Member Functions

- virtual ~**Handler** ()
- virtual void **flush** ()=0

  Flush the Handler's output, clears any buffers.

- virtual void **publish** (const **LogRecord** &record)=0

  *Publish the Log Record to this **Handler** (p. 1709).*

- virtual void **isLoggable** (const **LogRecord** &record)=0

  *Check if this **Handler** (p. 1709) would actually log a given **LogRecord** (p. 2050).*

- virtual void **setFilter** (const **Filter** *filter)=0

  *Sets the **Filter** (p. 1630) that this **Handler** (p. 1709) uses to filter Log Records.*

- virtual const **Filter** * **getFilter** ()=0

  *Gets the **Filter** (p. 1630) that this **Handler** (p. 1709) uses to filter Log Records.*

- virtual void **setLevel** (**Level** value)=0

  ***Set** (p. 2905) the log level specifying which message levels will be logged by this **Handler** (p. 1709).*

- virtual **Level** **getLevel** ()=0

  *Get the log level specifying which message levels will be logged by this **Handler** (p. 1709).*

- virtual void **setFormatter** (const **Formatter** *formatter)=0

  *Sets the `Formatter` (p. 1699) used by this **Handler** (p. 1709).*

- virtual const **Formatter** * **getFormatter** ()=0

  *Gets the `Formatter` (p. 1699) used by this **Handler** (p. 1709).*

6.325.1 Detailed Description

A **Handler** (p. 1709) object takes log messages from a **Logger** (p. 2028) and exports them. It might for example, write them to a console or write them to a file, or send them to a network logging service, or forward them to an OS log, or whatever.

A **Handler** (p. 1709) can be disabled by doing a setLevel(Level.OFF) and can be re-enabled by doing a setLevel with an appropriate level.

Handler (p. 1709) classes typically use **LogManager** (p. 2045) properties to set default values for the Handler's **Filter** (p. 1630), **Formatter** (p. 1699), and Level. See the specific documentation for each concrete **Handler** (p. 1709) class.

6.325.2 Constructor & Destructor Documentation

6.325.2.1 virtual decaf::util::logging::Handler::~Handler () [inline, virtual]

6.325.3 Member Function Documentation

6.325.3.1 virtual void decaf::util::logging::Handler::flush () [pure virtual]

Flush the Handler's output, clears any buffers.

Implemented in **decaf::util::logging::StreamHandler** (p. 3078).

6.325.3.2 virtual const Filter* decaf::util::logging::Handler::getFilter () [pure virtual]

Gets the **Filter** (p. 1630) that this **Handler** (p. 1709) uses to filter Log Records.

Returns:

`Filter` (p. 1630) derived instance

Implemented in **decaf::util::logging::StreamHandler** (p. 3078).

6.325.3.3 virtual const Formatter* decaf::util::logging::Handler::getFormatter () [pure virtual]

Gets the `Formatter` (p. 1699) used by this **Handler** (p. 1709).

Returns:

`Filter` (p. 1630) derived instance

Implemented in **decaf::util::logging::StreamHandler** (p. 3079).

6.325.3.4 virtual Level decaf::util::logging::Handler::getLevel () [pure virtual]

Get the log level specifying which message levels will be logged by this **Handler** (p. 1709).

Returns:

Level enumeration value

Implemented in **decaf::util::logging::StreamHandler** (p. 3079).

6.325.3.5 virtual void decaf::util::logging::Handler::isLoggable (const LogRecord & *record*) [pure virtual]

Check if this **Handler** (p. 1709) would actually log a given **LogRecord** (p. 2050). This method checks if the **LogRecord** (p. 2050) has an appropriate Level and whether it satisfies any **Filter** (p. 1630). It also may make other **Handler** (p. 1709) specific checks that might prevent a handler from logging the **LogRecord** (p. 2050).

Parameters:

record `LogRecord (p. 2050)` to check

Implemented in **decaf::util::logging::StreamHandler** (p. 3079).

6.325.3.6 virtual void decaf::util::logging::Handler::publish (const LogRecord & *record*) [pure virtual]

Publish the Log Record to this **Handler** (p. 1709).

Parameters:

record The Log Record to Publish

Implemented in **decaf::util::logging::StreamHandler** (p. 3079).

6.325.3.7 virtual void decaf::util::logging::Handler::setFilter (const Filter * *filter*) [pure virtual]

Sets the **Filter** (p. 1630) that this **Handler** (p. 1709) uses to filter Log Records. For each call of publish the **Handler** (p. 1709) will call this **Filter** (p. 1630) (if it is non-null) to check if the **LogRecord** (p. 2050) should be published or discarded.

Parameters:

filter `Filter (p. 1630)` derived instance

Implemented in **decaf::util::logging::StreamHandler** (p. 3080).

6.325.3.8 virtual void decaf::util::logging::Handler::setFormatter (const Formatter * *formatter*) [pure virtual]

Sets the `Formatter (p. 1699)` used by this **Handler** (p. 1709). Some Handlers may not use Formatters, in which case the **Formatter** (p. 1699) will be remembered, but not used.

Parameters:

formatter `Filter (p. 1630)` derived instance

Implemented in **decaf::util::logging::StreamHandler** (p. 3080).

6.325.3.9 virtual void decaf::util::logging::Handler::setLevel (Level *value*) [pure virtual]

Set (p. 2905) the log level specifying which message levels will be logged by this **Handler** (p. 1709). The intention is to allow developers to turn on voluminous logging, but to limit the messages that are sent to certain Handlers.

Parameters:

value Level enumeration value

Implemented in **decaf::util::logging::StreamHandler** (p. 3080).

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**Handler.h**

6.326 decaf::internal::util::HexStringParser Class Reference

`#include <src/main/decaf/internal/util/HexStringParser.h>`

Public Member Functions

- **HexStringParser** (int exponentWidth, int mantissaWidth)

  Create a new HexParser.

- virtual ~**HexStringParser** ()
- long long **parse** (const std::string &hexString)

  Parses a hex string using the specs given in the constructor and returns a long long with the bits of the parsed string, the caller can then convert those to a float or doulbe as needed.

Static Public Member Functions

- static double **parseDouble** (const std::string &hexString)
- static float **parseFloat** (const std::string &hexString)

6.326.1 Constructor & Destructor Documentation

6.326.1.1 decaf::internal::util::HexStringParser::HexStringParser (int *exponentWidth*, int *mantissaWidth*)

Create a new HexParser.

Parameters:

exponentWidth - Width of the exponent for the type to parse

mantissaWidth - Width of the mantissa for the type to parse

6.326.1.2 virtual decaf::internal::util::HexStringParser::~HexStringParser () `[inline, virtual]`

6.326.2 Member Function Documentation

6.326.2.1 long long decaf::internal::util::HexStringParser::parse (const std::string & *hexString*)

Parses a hex string using the specs given in the constructor and returns a long long with the bits of the parsed string, the caller can then convert those to a float or doulbe as needed.

Parameters:

hexString - string to parse

Returns:

the bits parsed from the string

6.326.2.2 static double decaf::internal::util::HexStringParser::parseDouble (const std::string & *hexString*) [static]

6.326.2.3 static float decaf::internal::util::HexStringParser::parseFloat (const std::string & *hexString*) [static]

The documentation for this class was generated from the following file:

- src/main/decaf/internal/util/**HexStringParser.h**

6.327 activemq::wireformat::openwire::utils::HexTable Class Reference

The **HexTable** (p. 1715) class maps hexidecimal strings to the value of an index into the table, i.e.

`#include <src/main/activemq/wireformat/openwire/utils/HexTable.h>`

Public Member Functions

- **HexTable** ()
- virtual ~**HexTable** ()
- virtual const std::string & **operator[]** (std::size_t index) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

  Index operator for this Table, will throw an exception if the index requested is out of bounds for this table.

- virtual const std::string & **operator[]** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
- virtual std::size_t **size** () const

  Returns the max size of this Table.

6.327.1 Detailed Description

The **HexTable** (p. 1715) class maps hexidecimal strings to the value of an index into the table, i.e. the class will return "FF" for the index 255 in the table.

6.327.2 Constructor & Destructor Documentation

6.327.2.1 activemq::wireformat::openwire::utils::HexTable::HexTable ()

6.327.2.2 virtual activemq::wireformat::openwire::utils::HexTable::~HexTable () [inline, virtual]

6.327.3 Member Function Documentation

6.327.3.1 virtual const std::string& activemq::wireformat::openwire::utils::HexTable::operator[] (std::size_t *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

6.327.3.2 virtual const std::string& activemq::wireformat::openwire::utils::HexTable::operator[] (std::size_t *index*) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

Index operator for this Table, will throw an exception if the index requested is out of bounds for this table.

Parameters:

index The index of the value in the table to fetch.

Returns:

string containing the hex value if the index

Exceptions:

IndexOutOfBoundsException

6.327.3.3 virtual std::size_t activemq::wireformat::openwire::utils::HexTable::size () const [inline, virtual]

Returns the max size of this Table.

Returns:

an integer size value

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/utils/**HexTable.h**

6.328 decaf::net::HttpRetryException Class Reference

`#include <src/main/decaf/net/HttpRetryException.h>`Inheritance diagram for decaf::net::HttpRetryException:

Public Member Functions

- **HttpRetryException** () throw ()
  Default Constructor.
- **HttpRetryException** (const Exception &ex) throw ()
  Conversion Constructor from some other Exception.
- **HttpRetryException** (const **HttpRetryException** &ex) throw ()
  Copy Constructor.
- **HttpRetryException** (const char *file, const int lineNumber, const std::exception ***cause**, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- **HttpRetryException** (const std::exception ***cause**) throw ()
  Constructor.
- **HttpRetryException** (const char *file, const int lineNumber, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **HttpRetryException** * **clone** () const
  Clones this exception.
- virtual ~**HttpRetryException** () throw ()

6.328.1 Constructor & Destructor Documentation

6.328.1.1 decaf::net::HttpRetryException::HttpRetryException () throw () [inline]

Default Constructor.

6.328.1.2 decaf::net::HttpRetryException::HttpRetryException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.328.1.3 decaf::net::HttpRetryException::HttpRetryException (const HttpRetryException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.328.1.4 decaf::net::HttpRetryException::HttpRetryException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.328.1.5 decaf::net::HttpRetryException::HttpRetryException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.328.1.6 decaf::net::HttpRetryException::HttpRetryException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.328.1.7 virtual decaf::net::HttpRetryException::~HttpRetryException () throw () [inline, virtual]

6.328.2 Member Function Documentation

6.328.2.1 virtual HttpRetryException* decaf::net::HttpRetryException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1822).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**HttpRetryException.h**

6.329 decaf::lang::exceptions::IllegalArgumentException Class Reference

`#include <src/main/decaf/lang/exceptions/IllegalArgumentException.h>`Inheritance diagram for decaf::lang::exceptions::IllegalArgumentException:

Public Member Functions

- **IllegalArgumentException** () throw ()
  Default Constructor.

  Constructor - Initializes the file name and line number where this message occurred.
- virtual **IllegalArgumentException** * **clone** () const
  Clones this exception.
- virtual ~**IllegalArgumentException** () throw ()

6.329.1 Constructor & Destructor Documentation

6.329.1.1 decaf::lang::exceptions::IllegalArgumentException::IllegalArgumentException () throw () [inline]

Default Constructor.

6.329.1.2 decaf::lang::exceptions::IllegalArgumentException::IllegalArgumentException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1574).

Parameters:

ex The **Exception** (p. 1574) whose data is to be copied into this one.

6.329.1.3 decaf::lang::exceptions::IllegalArgumentException::IllegalArgumentException (const IllegalArgumentException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex The **Exception** (p. 1574) whose data is to be copied into this one.

6.329.1.4 decaf::lang::exceptions::IllegalArgumentException::IllegalArgumentException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause **Pointer** (p. 2497) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.329.1.5 decaf::lang::exceptions::IllegalArgumentException::IllegalArgumentException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.329.1.6 decaf::lang::exceptions::IllegalArgumentException::IllegalArgumentException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.329.1.7 virtual decaf::lang::exceptions::IllegalArgumentException::~IllegalArgumentException () throw () [inline, virtual]

6.329.2 Member Function Documentation

6.329.2.1 virtual IllegalArgumentException* decaf::lang::exceptions::IllegalArgumentException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1574) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1577).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**IllegalArgumentException.h**

6.330.1 Constructor & Destructor Documentation

6.330.1.1 decaf::lang::exceptions::IllegalMonitorStateException::IllegalMonitorStateException () throw () [inline]

Default Constructor.

6.330.1.2 decaf::lang::exceptions::IllegalMonitorStateException::IllegalMonitorStateException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1574).

Parameters:

ex The **Exception** (p. 1574) whose data is to be copied into this one.

6.330.1.3 decaf::lang::exceptions::IllegalMonitorStateException::IllegalMonitorStateException (const IllegalMonitorStateException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex The **Exception** (p. 1574) whose data is to be copied into this one.

6.330.1.4 decaf::lang::exceptions::IllegalMonitorStateException::IllegalMonitorStateException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.330.1.5 decaf::lang::exceptions::IllegalMonitorStateException::IllegalMonitorStateException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.330.1.6 decaf::lang::exceptions::IllegalMonitorStateException::IllegalMonitorStateException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause **Pointer** (p. 2497) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.330.1.7 virtual decaf::lang::exceptions::IllegalMonitorStateException::~IllegalMonitorStateException () throw () [inline, virtual]

6.330.2 Member Function Documentation

6.330.2.1 virtual IllegalMonitorStateException* decaf::lang::exceptions::IllegalMonitorStateException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1574) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1577).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**IllegalMonitorStateException.h**

6.331.1 Constructor & Destructor Documentation

6.331.1.1 decaf::lang::exceptions::IllegalStateException::IllegalStateException () throw () [inline]

Default Constructor.

6.331.1.2 decaf::lang::exceptions::IllegalStateException::IllegalStateException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1574).

Parameters:

ex The **Exception** (p. 1574) whose data is to be copied into this one.

6.331.1.3 decaf::lang::exceptions::IllegalStateException::IllegalStateException (const IllegalStateException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex The **Exception** (p. 1574) whose data is to be copied into this one.

6.331.1.4 decaf::lang::exceptions::IllegalStateException::IllegalStateException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occured. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.331.1.5 decaf::lang::exceptions::IllegalStateException::IllegalStateException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.331.1.6 decaf::lang::exceptions::IllegalStateException::IllegalStateException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause **Pointer** (p. 2497) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.331.1.7 virtual decaf::lang::exceptions::IllegalStateException::~IllegalStateException () throw () [inline, virtual]

6.331.2 Member Function Documentation

6.331.2.1 virtual IllegalStateException* decaf::lang::exceptions::IllegalStateException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1574) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1577).

Reimplemented in **decaf::nio::InvalidMarkException** (p. 1815).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**IllegalStateException.h**

6.332 cms::IllegalStateException Class Reference

This exception is thrown when a method is invoked at an illegal or inappropriate time or if the provider is not in an appropriate state for the requested operation.

6.333.1 Constructor & Destructor Documentation

6.333.1.1 decaf::lang::exceptions::IllegalThreadStateException::IllegalThreadStateException () throw () [inline]

Default Constructor.

6.333.1.2 decaf::lang::exceptions::IllegalThreadStateException::IllegalThreadStateException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1574).

Parameters:

ex The **Exception** (p. 1574) whose data is to be copied into this one.

6.333.1.3 decaf::lang::exceptions::IllegalThreadStateException::IllegalThreadStateException (const IllegalThreadStateException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex The **Exception** (p. 1574) whose data is to be copied into this one.

6.333.1.4 decaf::lang::exceptions::IllegalThreadStateException::IllegalThreadStateException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occured. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.333.1.5 decaf::lang::exceptions::IllegalThreadStateException::IllegalThreadStateException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.333.1.6 decaf::lang::exceptions::IllegalThreadStateException::IllegalThreadStateException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause **Pointer** (p. 2497) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.333.1.7 virtual decaf::lang::exceptions::IllegalThreadStateException::~IllegalThreadStateException () throw () [inline, virtual]

6.333.2 Member Function Documentation

6.333.2.1 virtual IllegalThreadStateException* decaf::lang::exceptions::IllegalThreadStateException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1574) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1577).

The documentation for this class was generated from the following file:

6.334.2.6 virtual void activemq::transport::inactivity::InactivityMonitor::onCommand (const Pointer< Command > & *command*) [virtual]

Event handler for the receipt of a command.

Parameters:

command - the received command object.

Reimplemented from **activemq::transport::TransportFilter** (p. 3285).

6.334.2.7 virtual void activemq::transport::inactivity::InactivityMonitor::oneway (const Pointer< Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command the command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Reimplemented from **activemq::transport::TransportFilter** (p. 3285).

6.334.2.8 virtual void activemq::transport::inactivity::InactivityMonitor::onException (const decaf::lang::Exception & *ex*) [virtual]

Event handler for an exception from a command transport.

Parameters:

ex The exception to handle.

Reimplemented from **activemq::transport::TransportFilter** (p. 3286).

6.334.2.9 void activemq::transport::inactivity::InactivityMonitor::setInitialDelayTime (long long *value*) const

6.334.2.10 void activemq::transport::inactivity::InactivityMonitor::setKeepAliveResponseRequired (bool *value*)

6.334.2.11 void activemq::transport::inactivity::InactivityMonitor::setReadCheckTime (long long *value*)

6.334.2.12 void activemq::transport::inactivity::InactivityMonitor::setWriteCheckTime (long long *value*)

6.335.1 Constructor & Destructor Documentation

6.335.1.1 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException () throw () [inline]

Default Constructor.

6.335.1.2 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1574).

Parameters:

ex The **Exception** (p. 1574) whose data is to be copied into this one.

6.335.1.3 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const IndexOutOfBoundsException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex The **Exception** (p. 1574) whose data is to be copied into this one.

6.335.1.4 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.335.1.5 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.335.1.6 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause **Pointer** (p. 2497) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.335.1.7 virtual decaf::lang::exceptions::IndexOutOfBoundsException::~IndexOutOfBoundsException () throw () [inline, virtual]

6.335.2 Member Function Documentation

6.335.2.1 virtual IndexOutOfBoundsException* decaf::lang::exceptions::IndexOutOfBoundsException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1574) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1577).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**IndexOutOfBoundsException.h**

6.336 decaf::io::InputStream Class Reference

Base interface for an input stream.

`#include <src/main/decaf/io/InputStream.h>`Inheritance diagram for decaf::io::InputStream:

Public Member Functions

- virtual ~**InputStream** ()
- virtual void **mark** (int readLimit)=0

  Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

- virtual void **reset** ()=0 throw (IOException)

  Repositions this stream to the position at the time the mark method was last called on this input stream.

- virtual bool **markSupported** () const =0

  Determines if this input stream supports the mark and reset methods.

- virtual std::size_t **available** () const =0 throw (IOException)

  Indicates the number of bytes available.

- virtual int **read** ()=0 throw (IOException)

  Reads a single byte from the buffer.

- virtual int **read** (unsigned char *buffer, std::size_t offset, std::size_t bufferSize)=0 throw (IOException, lang::exceptions::NullPointerException)

  Reads an array of bytes from the buffer.

- virtual std::size_t **skip** (std::size_t num)=0 throw (io::IOException, lang::exceptions::UnsupportedOperationException)

  Skips over and discards n bytes of data from this input stream.

6.336.1 Detailed Description

Base interface for an input stream.

6.336.2 Constructor & Destructor Documentation

6.336.2.1 virtual decaf::io::InputStream::~InputStream () [inline, virtual]

6.336.3 Member Function Documentation

6.336.3.1 virtual std::size_t decaf::io::InputStream::available () const throw (IOException) [pure virtual]

Indicates the number of bytes available.

Returns:

the number of bytes available on this input stream.

Exceptions:

IOException *(* p. ***1820)*** if an error occurs.

Implemented in **decaf::internal::io::StandardInputStream** (p. 3001), **decaf::io::BlockingByteArrayInputStream** (p. 726), **decaf::io::BufferedInputStream** (p. 810), **decaf::io::ByteArrayInputStream** (p. 894), **decaf::io::FilterInputStream** (p. 1633), and **decaf::net::SocketInputStream** (p. 2979).

6.336.3.2 virtual void decaf::io::InputStream::mark (int *readLimit*) [pure virtual]

Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes. If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Parameters:

readLimit - max bytes read before marked position is invalid.

Implemented in **decaf::internal::io::StandardInputStream** (p. 3002), **decaf::io::BlockingByteArrayInputStream** (p. 727), **decaf::io::BufferedInputStream** (p. 811), **decaf::io::ByteArrayInputStream** (p. 895), **decaf::io::FilterInputStream** (p. 1634), and **decaf::net::SocketInputStream** (p. 2979).

6.336.3.3 virtual bool decaf::io::InputStream::markSupported () const [pure virtual]

Determines if this input stream supports the mark and reset methods. Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

Returns:

true if this stream instance supports marks

Implemented in **decaf::internal::io::StandardInputStream** (p. 3002), **decaf::io::BlockingByteArrayInputStream** (p. 727), **decaf::io::BufferedInputStream** (p. 811), **decaf::io::ByteArrayInputStream** (p. 895), **decaf::io::FilterInputStream** (p. 1634), and **decaf::net::SocketInputStream** (p. 2979).

6.336.3.4 virtual int decaf::io::InputStream::read (unsigned char * *buffer*, std::size_t *offset*, std::size_t *bufferSize*) throw (IOException, lang::exceptions::NullPointerException) [pure virtual]

Reads an array of bytes from the buffer. Blocks until the requested number of bytes are available.

Parameters:

buffer (out) the target buffer.

offset the position in the buffer to start reading from.

bufferSize the size of the output buffer.

Returns:

The number of bytes read or -1 if EOF is detected

Exceptions:

IOException *(*p. ***1820)*** thrown if an error occurs.

NullPointerException if buffer is null

Implemented in **activemq::io::LoggingInputStream** (p. 2038), **decaf::internal::io::StandardInputStream** (p. 3003), **decaf::io::BlockingByteArrayInputStream** (p. 728), **decaf::io::BufferedInputStream** (p. 811), **decaf::io::ByteArrayInputStream** (p. 896), **decaf::io::DataInputStream** (p. 1381), **decaf::io::FilterInputStream** (p. 1635), and **decaf::net::SocketInputStream** (p. 2980).

6.336.3.5 virtual int decaf::io::InputStream::read () throw (IOException) [pure virtual]

Reads a single byte from the buffer. The value byte is returned as an int in the range 0 to 255. If no byte is available because the end of the stream has been reached, the value -1 is returned. This method blocks until input data is available, the end of the stream is detected, or an exception is thrown.

Returns:

The next byte or -1 if the end of stream is reached.

Exceptions:

IOException *(*p. ***1820)*** thrown if an error occurs.

Implemented in **activemq::io::LoggingInputStream** (p. 2039), **decaf::internal::io::StandardInputStream** (p. 3004), **decaf::io::BlockingByteArrayInputStream** (p. 728), **decaf::io::BufferedInputStream** (p. 812), **decaf::io::ByteArrayInputStream** (p. 896), **decaf::io::DataInputStream** (p. 1382), **decaf::io::FilterInputStream** (p. 1636), and **decaf::net::SocketInputStream** (p. 2981).

6.336.3.6 virtual void decaf::io::InputStream::reset () throw (IOException) [pure virtual]

Repositions this stream to the position at the time the mark method was last called on this input stream. If the method markSupported returns true, then: * If the method mark has not been

called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 1820) might be thrown. * If such an **IOException** (p. 1820) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset. If the method markSupported returns false, then: * The call to reset may throw an **IOException** (p. 1820). * If an **IOException** (p. 1820) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

Exceptions:

IOException *(p. **1820**)*

Implemented in **decaf::internal::io::StandardInputStream** (p. 3004), **decaf::io::BlockingByteArrayInputStream** (p. 728), **decaf::io::BufferedInputStream** (p. 812), **decaf::io::ByteArrayInputStream** (p. 897), **decaf::io::FilterInputStream** (p. 1636), and **decaf::net::SocketInputStream** (p. 2981).

6.336.3.7 virtual std::size_t decaf::io::InputStream::skip (std::size_t *num*) throw (io::IOException, lang::exceptions::UnsupportedOperationException) [pure virtual]

Skips over and discards n bytes of data from this input stream. The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned. If n is negative, no bytes are skipped.

The skip method of **InputStream** (p. 1740) creates a byte array and then repeatedly reads into it until n bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters:

num - the number of bytes to skip

Returns:

total bytes skipped

Exceptions:

IOException *(p. **1820**)* if an error occurs

Implemented in **decaf::internal::io::StandardInputStream** (p. 3004), **decaf::io::BlockingByteArrayInputStream** (p. 729), **decaf::io::BufferedInputStream** (p. 812), **decaf::io::ByteArrayInputStream** (p. 897), **decaf::io::DataInputStream** (p. 1387), **decaf::io::FilterInputStream** (p. 1637), and **decaf::net::SocketInputStream** (p. 2981).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**InputStream.h**

6.337 decaf::internal::nio::IntArrayBuffer Class Reference

`#include <src/main/decaf/internal/nio/IntArrayBuffer.h>`Inheritance diagram for decaf::internal::nio::IntArrayBuffer:

Public Member Functions

- **IntArrayBuffer** (std::size_t capacity, bool readOnly=false)

  *Creates a **IntArrayBuffer** (p. 1744) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

- **IntArrayBuffer** (int *array, std::size_t offset, std::size_t capacity, bool readOnly=false) throw (decaf::lang::exceptions::NullPointerException)

  *Creates a **IntArrayBuffer** (p. 1744) object that wraps the given array.*

- **IntArrayBuffer** (**ByteArrayPerspective** &array, std::size_t offset, std::size_t capacity, bool readOnly=false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

  *Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 908) and start at the given offset.*

- **IntArrayBuffer** (const **IntArrayBuffer** &other)

  *Create a **IntArrayBuffer** (p. 1744) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 908) and when changes are made to that data it is reflected in both.*

- virtual ~**IntArrayBuffer** ()
- virtual int * **array** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)

  Returns the int array that backs this buffer (optional operation).

- virtual std::size_t **arrayOffset** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

- virtual IntBuffer * **asReadOnlyBuffer** () const

  Creates a new, read-only int buffer that shares this buffer's content.

- virtual IntBuffer & **compact** () throw (decaf::nio::ReadOnlyBufferException)

  Compacts this buffer.

- virtual IntBuffer * **duplicate** ()

  Creates a new int buffer that shares this buffer's content.

- virtual int **get** () throw (decaf::nio::BufferUnderflowException)

  Relative get method.

- virtual int **get** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)

Absolute get method.

- virtual bool **hasArray** () const

  Tells whether or not this buffer is backed by an accessible int array.

- virtual bool **isReadOnly** () const

  Tells whether or not this buffer is read-only.

- virtual IntBuffer & **put** (int value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

  Writes the given doubles into this buffer at the current position, and then increments the position.

- virtual IntBuffer & **put** (std::size_t index, int value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)

  Writes the given doubles into this buffer at the given index.

- virtual IntBuffer * **slice** () const

  Creates a new IntBuffer whose content is a shared subsequence of this buffer's content.

Protected Member Functions

- virtual void **setReadOnly** (bool value)

  *Sets this **ByteArrayBuffer** (p. 870) as Read-Only.*

6.337.1 Constructor & Destructor Documentation

6.337.1.1 decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (std::size_t *capacity*, bool *readOnly* = `false`)

Creates a **IntArrayBuffer** (p. 1744) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

6.337.1.2 decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (int * *array*, std::size_t *offset*, std::size_t *capacity*, bool *readOnly* = `false`) throw (decaf::lang::exceptions::NullPointerException)

Creates a **IntArrayBuffer** (p. 1744) object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

offset - the position that is this buffers start pos.

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

Exceptions:

NullPointerException if buffer is NULL

6.337.1.3 decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (ByteArrayPerspective & *array*, std::size_t *offset*, std::size_t *capacity*, bool *readOnly* = `false`) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 908) and start at the given offset. The capacity and limit of the new **IntArrayBuffer** (p. 1744) will be that of the remaining capacity of the passed buffer.

Parameters:

array - the **ByteArrayPerspective** (p. 908) to wrap

offset - the offset into array where the buffer starts

capacity - the length of the array we are wrapping or limit.

readOnly - is this a readOnly buffer.

Exceptions:

IndexOutOfBoundsException if offset is greater than array capacity.

6.337.1.4 decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (const IntArrayBuffer & *other*)

Create a **IntArrayBuffer** (p. 1744) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 908) and when changes are made to that data it is reflected in both.

Parameters:

other - the **IntArrayBuffer** (p. 1744) this one is to mirror.

6.337.1.5 virtual decaf::internal::nio::IntArrayBuffer::~IntArrayBuffer () `[virtual]`

6.337.2 Member Function Documentation

6.337.2.1 virtual int* decaf::internal::nio::IntArrayBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) `[virtual]`

Returns the int array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this Buffer

Exceptions:

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::IntBuffer** (p. 1753).

6.337.2.2 virtual std::size_t decaf::internal::nio::IntArrayBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::IntBuffer** (p. 1754).

6.337.2.3 virtual IntBuffer* decaf::internal::nio::IntArrayBuffer::asReadOnlyBuffer () const [virtual]

Creates a new, read-only int buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only int buffer which the caller then owns.

Implements **decaf::nio::IntBuffer** (p. 1754).

6.337.2.4 virtual IntBuffer& decaf::internal::nio::IntArrayBuffer::compact () throw (decaf::nio::ReadOnlyBufferException) [virtual]

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 807) is copied

to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 807) - 1 is copied to index n = **limit()** (p. 807) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this IntBuffer

Exceptions:

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::IntBuffer** (p. 1754).

6.337.2.5 virtual IntBuffer* decaf::internal::nio::IntArrayBuffer::duplicate () [virtual]

Creates a new int buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new int Buffer which the caller owns.

Implements **decaf::nio::IntBuffer** (p. 1755).

6.337.2.6 virtual int decaf::internal::nio::IntArrayBuffer::get (std::size_t *index*) const throw (lang::exceptions::IndexOutOfBoundsException) [virtual]

Absolute get method. Reads the value at the given index.

Parameters:

index - the index in the Buffer where the int is to be read

Returns:

the int that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implements **decaf::nio::IntBuffer** (p. 1756).

6.337.2.7 virtual int decaf::internal::nio::IntArrayBuffer::get () throw (decaf::nio::BufferUnderflowException) [virtual]

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the int at the current position

Exceptions:

BufferUnderflowException if there no more data to return

Implements **decaf::nio::IntBuffer** (p. 1757).

6.337.2.8 virtual bool decaf::internal::nio::IntArrayBuffer::hasArray () const [inline, virtual]

Tells whether or not this buffer is backed by an accessible int array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implements **decaf::nio::IntBuffer** (p. 1757).

6.337.2.9 virtual bool decaf::internal::nio::IntArrayBuffer::isReadOnly () const [inline, virtual]

Tells whether or not this buffer is read-only.

Returns:

true if, and only if, this buffer is read-only

Implements **decaf::nio::Buffer** (p. 806).

6.337.2.10 virtual IntBuffer& decaf::internal::nio::IntArrayBuffer::put (std::size_t *index*, int *value*) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException) [virtual]

Writes the given doubles into this buffer at the given index.

Parameters:

index - position in the Buffer to write the data

value - the doubles to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::IntBuffer** (p. 1758).

6.337.2.11 virtual IntBuffer& decaf::internal::nio::IntArrayBuffer::put (int *value*) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException) [virtual]

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters:

value - the doubles value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::IntBuffer** (p. 1758).

6.337.2.12 virtual void decaf::internal::nio::IntArrayBuffer::setReadOnly (bool *value*) [inline, protected, virtual]

Sets this **ByteArrayBuffer** (p. 870) as Read-Only.

Parameters:

value - true if this buffer is to be read-only.

6.337.2.13 virtual IntBuffer* decaf::internal::nio::IntArrayBuffer::slice () const [virtual]

Creates a new IntBuffer whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create IntBuffer which the caller owns.

Implements **decaf::nio::IntBuffer** (p. 1760).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/nio/**IntArrayBuffer.h**

6.338 decaf::nio::IntBuffer Class Reference

This class defines four categories of operations upon int buffers:.

`#include <src/main/decaf/nio/IntBuffer.h>`Inheritance diagram for decaf::nio::IntBuffer:

Public Member Functions

- virtual ~**IntBuffer** ()
- virtual std::string **toString** () const
- virtual int * **array** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)

  Returns the int array that backs this buffer (optional operation).

- virtual std::size_t **arrayOffset** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

- virtual **IntBuffer** * **asReadOnlyBuffer** () const =0

  Creates a new, read-only int buffer that shares this buffer's content.

- virtual **IntBuffer** & **compact** ()=0 throw (ReadOnlyBufferException)

  Compacts this buffer.

- virtual **IntBuffer** * **duplicate** ()=0

  Creates a new int buffer that shares this buffer's content.

- virtual int **get** ()=0 throw (BufferUnderflowException)

  Relative get method.

- virtual int **get** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)

  Absolute get method.

- **IntBuffer** & **get** (std::vector< int > buffer) throw (BufferUnderflowException)

  Relative bulk get method.

- **IntBuffer** & **get** (int *buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)

  Relative bulk get method.

- virtual bool **hasArray** () const =0

  Tells whether or not this buffer is backed by an accessible int array.

- **IntBuffer** & **put** (**IntBuffer** &src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)

  This method transfers the ints remaining in the given source buffer into this buffer.

- **IntBuffer** & **put** (const int *buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)

  This method transfers ints into this buffer from the given source array.

- **IntBuffer** & **put** (std::vector< int > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)

  This method transfers the entire content of the given source ints array into this buffer.

- virtual **IntBuffer** & **put** (int value)=0 throw (BufferOverflowException, ReadOnlyBufferException)

  Writes the given ints into this buffer at the current position, and then increments the position.

- virtual **IntBuffer** & **put** (std::size_t index, int value)=0 throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)

  Writes the given ints into this buffer at the given index.

- virtual **IntBuffer** * **slice** () const =0

  *Creates a new **IntBuffer** (p. 1751) whose content is a shared subsequence of this buffer's content.*

- virtual int **compareTo** (const **IntBuffer** &value) const

  Compares this object with the specified object for order.

- virtual bool **equals** (const **IntBuffer** &value) const
- virtual bool **operator==** (const **IntBuffer** &value) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const **IntBuffer** &value) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

Static Public Member Functions

- static **IntBuffer** * **allocate** (std::size_t capacity)

  Allocates a new Double buffer.

- static **IntBuffer** * **wrap** (int *array, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)

  *Wraps the passed buffer with a new **IntBuffer** (p. 1751).*

- static **IntBuffer** * **wrap** (std::vector< int > &buffer)

  *Wraps the passed STL int Vector in a **IntBuffer** (p. 1751).*

Protected Member Functions

- **IntBuffer** (std::size_t capacity)

  *Creates a **IntBuffer** (p. 1751) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.338.1 Detailed Description

This class defines four categories of operations upon int buffers:. o Absolute and relative get and put methods that read and write single ints; o Relative bulk get methods that transfer contiguous sequences of ints from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of ints from a int array or some other int buffer into this buffer o Methods for compacting, duplicating, and slicing a int buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing int array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.338.2 Constructor & Destructor Documentation

6.338.2.1 decaf::nio::IntBuffer::IntBuffer (std::size_t *capacity*) [protected]

Creates a **IntBuffer** (p. 1751) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size and limit of the **Buffer** (p. 803) in doubles

6.338.2.2 virtual decaf::nio::IntBuffer::~IntBuffer () [inline, virtual]

6.338.3 Member Function Documentation

6.338.3.1 static IntBuffer* decaf::nio::IntBuffer::allocate (std::size_t *capacity*) [static]

Allocates a new Double buffer. The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters:

capacity - The size of the Double buffer in ints

Returns:

the **IntBuffer** (p. 1751) that was allocated, caller owns.

6.338.3.2 virtual int* decaf::nio::IntBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]

Returns the int array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this **Buffer** (p. 803)

Exceptions:

ReadOnlyBufferException *(p. 2685)* if this **Buffer** (p. 803) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1746).

6.338.3.3 virtual std::size_t decaf::nio::IntBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException *(p. 2685)* if this **Buffer** (p. 803) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1747).

6.338.3.4 virtual IntBuffer* decaf::nio::IntBuffer::asReadOnlyBuffer () const [pure virtual]

Creates a new, read-only int buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only int buffer which the caller then owns.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1747).

6.338.3.5 virtual IntBuffer& decaf::nio::IntBuffer::compact () throw (ReadOnlyBufferException) [pure virtual]

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 807) is copied

to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 807) - 1 is copied to index n = **limit()** (p. 807) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **IntBuffer** (p. 1751)

Exceptions:

ReadOnlyBufferException *(p. 2685)* - If this buffer is read-only

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1747).

6.338.3.6 virtual int decaf::nio::IntBuffer::compareTo (const IntBuffer & *value*) const [virtual]

Compares this object with the specified object for order. Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Parameters:

value - the Object to be compared.

Returns:

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

6.338.3.7 virtual IntBuffer* decaf::nio::IntBuffer::duplicate () [pure virtual]

Creates a new int buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new int **Buffer** (p. 803) which the caller owns.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1748).

6.338.3.8 virtual bool decaf::nio::IntBuffer::equals (const IntBuffer & *value*) const [virtual]

Returns:

true if this value is considered equal to the passed value.

6.338.3.9 IntBuffer& decaf::nio::IntBuffer::get (int * *buffer*, std::size_t *offset*, std::size_t *length*) throw (BufferUnderflowException, lang::exceptions::NullPointerException)

Relative bulk get method. This method transfers ints from this buffer into the given destination array. If there are fewer ints remaining in the buffer than are required to satisfy the request, that is, if length > **remaining()** (p. 808), then no bytes are transferred and a **BufferUnderflowException** (p. 837) is thrown.

Otherwise, this method copies length ints from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters:

buffer - pointer to an allocated buffer to fill

offset - position in the buffer to start filling

length - amount of data to put in the passed buffer

Returns:

a reference to this **Buffer** (p. 803)

Exceptions:

BufferUnderflowException *(p. 837)* - If there are fewer than length ints remaining in this buffer

NullPointerException if the passed buffer is null.

6.338.3.10 IntBuffer& decaf::nio::IntBuffer::get (std::vector< int > *buffer*) throw (BufferUnderflowException)

Relative bulk get method. This method transfers values from this buffer into the given destination vector. An invocation of this method of the form src.get(a) behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call buffer.resize(N) before calling this get method.

Returns:

a reference to this **Buffer** (p. 803)

Exceptions:

BufferUnderflowException *(p. 837)* - If there are fewer than length ints remaining in this buffer

6.338.3.11 virtual int decaf::nio::IntBuffer::get (std::size_t *index*) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Absolute get method. Reads the value at the given index.

Parameters:

index - the index in the **Buffer** (p. 803) where the int is to be read

Returns:

the int that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1748).

6.338.3.12 virtual int decaf::nio::IntBuffer::get () throw (BufferUnderflowException) [pure virtual]

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the int at the current position

Exceptions:

BufferUnderflowException *(*p. ***837)*** if there no more data to return

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1748).

6.338.3.13 virtual bool decaf::nio::IntBuffer::hasArray () const [pure virtual]

Tells whether or not this buffer is backed by an accessible int array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1749).

6.338.3.14 virtual bool decaf::nio::IntBuffer::operator< (const IntBuffer & *value*) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.338.3.15 virtual bool decaf::nio::IntBuffer::operator== (const IntBuffer & *value*) const [virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.338.3.16 virtual IntBuffer& decaf::nio::IntBuffer::put (std::size_t *index*, int *value*) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException) [pure virtual]

Writes the given ints into this buffer at the given index.

Parameters:

index - position in the **Buffer** (p. 803) to write the data

value - the ints to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. ***2685***) - If this buffer is read-only

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1749).

6.338.3.17 virtual IntBuffer& decaf::nio::IntBuffer::put (int *value*) throw (BufferOverflowException, ReadOnlyBufferException) [pure virtual]

Writes the given ints into this buffer at the current position, and then increments the position.

Parameters:

value - the ints value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. ***834***) - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException (p. ***2685***) - If this buffer is read-only

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1750).

6.338.3.18 IntBuffer& decaf::nio::IntBuffer::put (std::vector< int > & *buffer*) throw (BufferOverflowException, ReadOnlyBufferException)

This method transfers the entire content of the given source ints array into this buffer. This is the same as calling put(&buffer[0], 0, buffer.size()

Parameters:

buffer - The buffer whose contents are copied to this **IntBuffer** (p. 1751)

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. ***834***) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. ***2685***) - If this buffer is read-only

6.338.3.19 IntBuffer& decaf::nio::IntBuffer::put (const int * *buffer*, std::size_t *offset*, std::size_t *length*) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)

This method transfers ints into this buffer from the given source array. If there are more ints to be copied from the array than remain in this buffer, that is, if length > **remaining()** (p. 808), then no ints are transferred and a **BufferOverflowException** (p. 834) is thrown.

Otherwise, this method copies length bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by length.

Parameters:

buffer- The array from which ints are to be read

offset- The offset within the array of the first int to be read;

length - The number of ints to be read from the given array

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException (p. ***834***) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. ***2685***) - If this buffer is read-only

NullPointerException if the passed buffer is null.

6.338.3.20 IntBuffer& decaf::nio::IntBuffer::put (IntBuffer & *src*) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)

This method transfers the ints remaining in the given source buffer into this buffer. If there are more ints remaining in the source buffer than in this buffer, that is, if src.remaining() >

remaining() (p. 808), then no ints are transferred and a **BufferOverflowException** (p. 834) is thrown.

Otherwise, this method copies n = src.remaining() ints from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by n.

Parameters:

src - the buffer to take ints from an place in this one.

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException *(p. 834)* - If there is insufficient space in this buffer for the remaining ints in the source buffer

IllegalArgumentException - If the source buffer is this buffer

ReadOnlyBufferException *(p. 2685)* - If this buffer is read-only

6.338.3.21 virtual IntBuffer* decaf::nio::IntBuffer::slice () const [pure virtual]

Creates a new **IntBuffer** (p. 1751) whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **IntBuffer** (p. 1751) which the caller owns.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1750).

6.338.3.22 virtual std::string decaf::nio::IntBuffer::toString () const [virtual]

Returns:

a std::string describing this object

6.338.3.23 static IntBuffer* decaf::nio::IntBuffer::wrap (std::vector< int > & *buffer*) [static]

Wraps the passed STL int Vector in a **IntBuffer** (p. 1751). The new buffer will be backed by the given int array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns:

a new **IntBuffer** (p. 1751) that is backed by buffer, caller owns.

6.338.3.24 static IntBuffer* decaf::nio::IntBuffer::wrap (int * *array*, std::size_t *offset*, std::size_t *length*) throw (lang::exceptions::NullPointerException) [static]

Wraps the passed buffer with a new **IntBuffer** (p. 1751). The new buffer will be backed by the given int array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

array - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns:

a new **IntBuffer** (p. 1751) that is backed by buffer, caller owns.

The documentation for this class was generated from the following file:

- src/main/decaf/nio/**IntBuffer.h**

6.339 decaf::lang::Integer Class Reference

`#include <src/main/decaf/lang/Integer.h>`Inheritance diagram for decaf::lang::Integer:

Public Member Functions

- **Integer** (int value)
- **Integer** (const std::string &value) throw (exceptions::NumberFormatException)
- virtual ~**Integer** ()
- virtual int **compareTo** (const **Integer** &i) const

  *Compares this **Integer** (p. 1762) instance with another.*

- bool **equals** (const **Integer** &i) const
- virtual bool **operator==** (const **Integer** &i) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const **Integer** &i) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- virtual int **compareTo** (const int &i) const

  *Compares this **Integer** (p. 1762) instance with another.*

- bool **equals** (const int &i) const
- virtual bool **operator==** (const int &i) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const int &i) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- std::string **toString** () const
- virtual double **doubleValue** () const

  Answers the double value which the receiver represents.

- virtual float **floatValue** () const

  Answers the float value which the receiver represents.

- virtual unsigned char **byteValue** () const

  Answers the byte value which the receiver represents.

- virtual short **shortValue** () const

  Answers the short value which the receiver represents.

- virtual int **intValue** () const

  Answers the int value which the receiver represents.

- virtual long long **longValue** () const

  Answers the long value which the receiver represents.

Static Public Member Functions

- static **Integer decode** (const std::string &value) throw (exceptions::NumberFormatException)

  *Decodes a String into a **Integer** (p. 1762).*

- static int **reverseBytes** (int value)

  Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified int value.

- static int **reverse** (int value)

  Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified int value.

- static int **parseInt** (const std::string &s, int radix) throw (exceptions::NumberFormatException)

  Parses the string argument as a signed int in the radix specified by the second argument.

- static int **parseInt** (const std::string &s) throw (exceptions::NumberFormatException)

  Parses the string argument as a signed decimal int.

- static **Integer valueOf** (int value)

  *Returns a **Integer** (p. 1762) instance representing the specified int value.*

- static **Integer valueOf** (const std::string &value) throw (exceptions::NumberFormatException)

  *Returns a **Integer** (p. 1762) object holding the value given by the specified std::string.*

- static **Integer valueOf** (const std::string &value, int radix) throw (exceptions::NumberFormatException)

  *Returns a **Integer** (p. 1762) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*

- static int **bitCount** (int value)

  Returns the number of one-bits in the two's complement binary representation of the specified int value.

- static std::string **toString** (int value)

  Converts the int to a String representation.

- static std::string **toString** (int value, int radix)

  Returns a string representation of the first argument in the radix specified by the second argument.

- static std::string **toHexString** (int value)

  Returns a string representation of the integer argument as an unsigned integer in base 16.

- static std::string **toOctalString** (int value)

  Returns a string representation of the integer argument as an unsigned integer in base 8.

- static std::string **toBinaryString** (int value)

  Returns a string representation of the integer argument as an unsigned integer in base 2.

- static int **highestOneBit** (int value)

  Returns an int value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value.

- static int **lowestOneBit** (int value)

  Returns an int value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value.

- static int **numberOfLeadingZeros** (int value)

  Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified int value.

- static int **numberOfTrailingZeros** (int value)

  Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified int value.

- static int **rotateLeft** (int value, int distance)

  Returns the value obtained by rotating the two's complement binary representation of the specified int value left by the specified number of bits.

- static int **rotateRight** (int value, int distance)

  Returns the value obtained by rotating the two's complement binary representation of the specified int value right by the specified number of bits.

- static int **signum** (int value)

  Returns the signum function of the specified int value.

Static Public Attributes

- static const int **SIZE** = 32

  The size in bits of the primitive int type.

- static const int **MAX_VALUE** = (int)0x7FFFFFFF

  The maximum value that the primitive type can hold.

- static const int **MIN_VALUE** = (int)0x80000000

  The minimum value that the primitive type can hold.

6.339.1 Constructor & Destructor Documentation

6.339.1.1 decaf::lang::Integer::Integer (int *value*)

Parameters:

value The primitive value to wrap in an `Integer` (p. 1762) instance.

6.339.1.2 decaf::lang::Integer::Integer (const std::string & *value*) throw (exceptions::NumberFormatException)

Parameters:

value The base 10 encoded string to decode to an `Integer` (p. 1762) and wrap.

Exceptions:

NumberFormatException

6.339.1.3 virtual decaf::lang::Integer::~Integer () [inline, virtual]

6.339.2 Member Function Documentation

6.339.2.1 static int decaf::lang::Integer::bitCount (int *value*) [static]

Returns the number of one-bits in the two's complement binary representation of the specified int value. This function is sometimes referred to as the population count.

Parameters:

value - the int to count

Returns:

the number of one-bits in the two's complement binary representation of the specified int value.

6.339.2.2 virtual unsigned char decaf::lang::Integer::byteValue () const [inline, virtual]

Answers the byte value which the receiver represents.

Returns:

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2432).

6.339.2.3 virtual int decaf::lang::Integer::compareTo (const int & *i*) const [virtual]

Compares this **Integer** (p. 1762) instance with another.

Parameters:

i - the **Integer** (p. 1762) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable< int >** (p. 1083).

6.339.2.4 virtual int decaf::lang::Integer::compareTo (const Integer & *i*) const [virtual]

Compares this **Integer** (p. 1762) instance with another.

Parameters:

i - the **Integer** (p. 1762) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable< Integer >** (p. 1083).

6.339.2.5 static Integer decaf::lang::Integer::decode (const std::string & *value*) throw (exceptions::NumberFormatException) [static]

Decodes a String into a **Integer** (p. 1762). Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the Integer.parseInteger method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a NumberFormatException will be thrown. The result is negated if first character of the specified String is the minus sign. No whitespace characters are permitted in the string.

Parameters:

value - The string to decode

Returns:

a **Integer** (p. 1762) object containing the decoded value

Exceptions:

NumberFomatException if the string is not formatted correctly.

6.339.2.6 virtual double decaf::lang::Integer::doubleValue () const [inline, virtual]

Answers the double value which the receiver represents.

Returns:

double the value of the receiver.

Implements **decaf::lang::Number** (p. 2433).

6.339.2.7 bool decaf::lang::Integer::equals (const int & *i*) const [inline, virtual]

Parameters:

i - the **Integer** (p. 1762) object to compare against.

Returns:

true if the two **Integer** (p. 1762) Objects have the same value.

Implements **decaf::lang::Comparable< int >** (p. 1084).

6.339.2.8 bool decaf::lang::Integer::equals (const Integer & *i*) const [inline, virtual]

Parameters:

i - the **Integer** (p. 1762) object to compare against.

Returns:

true if the two **Integer** (p. 1762) Objects have the same value.

Implements **decaf::lang::Comparable< Integer >** (p. 1084).

6.339.2.9 virtual float decaf::lang::Integer::floatValue () const [inline, virtual]

Answers the float value which the receiver represents.

Returns:

float the value of the receiver.

Implements **decaf::lang::Number** (p. 2433).

6.339.2.10 static int decaf::lang::Integer::highestOneBit (int *value*) [static]

Returns an int value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value. Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters:

value - the int to be inspected

Returns:

an int value with a single one-bit, in the position of the highest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.339.2.11 virtual int decaf::lang::Integer::intValue () const [inline, virtual]

Answers the int value which the receiver represents.

Returns:

int the value of the receiver.

Implements **decaf::lang::Number** (p. 2433).

6.339.2.12 virtual long long decaf::lang::Integer::longValue () const [inline, virtual]

Answers the long value which the receiver represents.

Returns:

long the value of the receiver.

Implements **decaf::lang::Number** (p. 2433).

6.339.2.13 static int decaf::lang::Integer::lowestOneBit (int *value*) [static]

Returns an int value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value. Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters:

value - the int to be inspected

Returns:

an int value with a single one-bit, in the position of the lowest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.339.2.14 static int decaf::lang::Integer::numberOfLeadingZeros (int *value*) [static]

Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified int value. Returns 32 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Note that this method is closely related to the logarithm base 2. For all positive int values x:

∗ floor(log2(x)) = 31 - numberOfLeadingZeros(x) ∗ ceil(log2(x)) = 32 - numberOfLeadingZeros(x - 1)

Parameters:

value - the int to be inspected

Returns:

the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified int value, or 32 if the value is equal to zero.

6.339.2.15 static int decaf::lang::Integer::numberOfTrailingZeros (int *value*) [static]

Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified int value. Returns 32 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Parameters:

value - the int to be inspected

Returns:

the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified int value, or 32 if the value is equal to zero.

6.339.2.16 virtual bool decaf::lang::Integer::operator< (const int & *i*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

i - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< int >** (p. 1084).

6.339.2.17 virtual bool decaf::lang::Integer::operator< (const Integer & *i*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

i - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Integer >** (p. 1084).

6.339.2.18 virtual bool decaf::lang::Integer::operator== (const int & *i*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

i - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< int >** (p. 1085).

6.339.2.19 virtual bool decaf::lang::Integer::operator== (const Integer & *i*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

i - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Integer >** (p. 1085).

6.339.2.20 static int decaf::lang::Integer::parseInt (const std::string & *s*) throw (exceptions::NumberFormatException) [static]

Parses the string argument as a signed decimal int. The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting int value is returned, exactly as if the argument and the radix 10 were given as arguments to the parseInteger(const std::string, int) method.

Parameters:

s - String to convert to a int

Returns:

the converted int value

Exceptions:

NumberFormatException if the string is not a int.

6.339.2.21 static int decaf::lang::Integer::parseInt (const std::string & *s*, int *radix*) throw (exceptions::NumberFormatException) [static]

Parses the string argument as a signed int in the radix specified by the second argument. The characters in the string must all be digits, of the specified radix (as determined by whether **Character.digit(char, int)** (p. 985) returns a nonnegative value) except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting byte value is returned.

An exception of type NumberFormatException is thrown if any of the following situations occurs: * The first argument is null or is a string of length zero. * The radix is either smaller than

Character.MIN_RADIX (p. 989) or larger than **Character.MAX_RADIX** (p. 989). * Any character of the string is not a digit of the specified radix, except that the first character may be a minus sign '-' provided that the string is longer than length 1. * The value represented by the string is not a value of type int.

Parameters:

s - the String containing the int representation to be parsed

radix - the radix to be used while parsing s

Returns:

the int represented by the string argument in the specified radix.

Exceptions:

NumberFormatException - If String does not contain a parsable int.

6.339.2.22 static int decaf::lang::Integer::reverse (int *value*) [static]

Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified int value.

Parameters:

value - the value whose bits are to be reversed

Returns:

the reversed bits int.

6.339.2.23 static int decaf::lang::Integer::reverseBytes (int *value*) [static]

Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified int value.

Parameters:

value - the int whose bytes we are to reverse

Returns:

the reversed int.

6.339.2.24 static int decaf::lang::Integer::rotateLeft (int *value*, int *distance*) [static]

Returns the value obtained by rotating the two's complement binary representation of the specified int value left by the specified number of bits. (Bits shifted out of the left hand, or high-order, side reenter on the right, or low-order.)

Note that left rotation with a negative distance is equivalent to right rotation: rotateLeft(val, -distance) == rotateRight(val, distance). Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation distance can be ignored, even if the distance is negative: rotateLeft(val, distance) == rotateLeft(val, distance & 0x1F).

Parameters:

value - the int to be inspected

distance - the number of bits to rotate

Returns:

the value obtained by rotating the two's complement binary representation of the specified int value left by the specified number of bits.

6.339.2.25 static int decaf::lang::Integer::rotateRight (int *value*, int *distance*) [static]

Returns the value obtained by rotating the two's complement binary representation of the specified int value right by the specified number of bits. (Bits shifted out of the right hand, or low-order, side reenter on the left, or high-order.)

Note that right rotation with a negative distance is equivalent to left rotation: rotateRight(val, -distance) == rotateLeft(val, distance). Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation distance can be ignored, even if the distance is negative: rotateRight(val, distance) == rotateRight(val, distance & 0x1F).

Parameters:

value - the int to be inspected

distance - the number of bits to rotate

Returns:

the value obtained by rotating the two's complement binary representation of the specified int value right by the specified number of bits.

6.339.2.26 virtual short decaf::lang::Integer::shortValue () const [inline, virtual]

Answers the short value which the receiver represents.

Returns:

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2434).

6.339.2.27 static int decaf::lang::Integer::signum (int *value*) [static]

Returns the signum function of the specified int value. (The return value is -1 if the specified value is negative; 0 if the specified value is zero; and 1 if the specified value is positive.)

Parameters:

value - the int to be inspected

Returns:

the signum function of the specified int value.

6.339.2.28 static std::string decaf::lang::Integer::toBinaryString (int *value*) [static]

Returns a string representation of the integer argument as an unsigned integer in base 2. The unsigned integer value is the argument plus 2^32 if the argument is negative; otherwise it is equal to the argument. This value is converted to a string of ASCII digits in binary (base 2) with no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character.

The characters '0' and '1' are used as binary digits.

Parameters:

value - the int to be translated to a binary string

Returns:

the unsigned int value as a binary string

6.339.2.29 static std::string decaf::lang::Integer::toHexString (int *value*) [static]

Returns a string representation of the integer argument as an unsigned integer in base 16. The unsigned integer value is the argument plus 2^32 if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in hexadecimal (base 16) with no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as hexadecimal digits:

0123456789abcdef

If uppercase letters are desired, the toUpperCase() method may be called on the result:

Parameters:

value - the int to be translated to an Octal string

Returns:

the unsigned int value as a Octal string

6.339.2.30 static std::string decaf::lang::Integer::toOctalString (int *value*) [static]

Returns a string representation of the integer argument as an unsigned integer in base 8. The unsigned integer value is the argument plus 2^32 if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in octal (base 8) with no extra leading 0s.

If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as octal digits:

01234567

Parameters:

value - the int to be translated to an Octal string

Returns:

the unsigned int value as a Octal string

6.339.2.31 static std::string decaf::lang::Integer::toString (int *value*, int *radix*) [static]

Returns a string representation of the first argument in the radix specified by the second argument. If the radix is smaller than **Character.MIN_RADIX** (p. 989) or larger than **Character.MAX_RADIX** (p. 989), then the radix 10 is used instead.

If the first argument is negative, the first element of the result is the ASCII minus character '-'. If the first argument is not negative, no sign character appears in the result.

The remaining characters of the result represent the magnitude of the first argument. If the magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the magnitude will not be the zero character. The following ASCII characters are used as digits:

0123456789abcdefghijklmnopqrstuvwxyz

Parameters:

value - the int to convert to a string

radix - the radix to format the string in

Returns:

an int formatted to the string value of the radix given.

6.339.2.32 static std::string decaf::lang::Integer::toString (int *value*) [static]

Converts the int to a String representation.

Parameters:

value The int to convert to a `std::string` instance.

Returns:

string representation

6.339.2.33 std::string decaf::lang::Integer::toString () const

Returns:

this `Integer` (p. 1762) Object as a String Representation

6.339.2.34 static Integer decaf::lang::Integer::valueOf (const std::string & *value*, int *radix*) throw (exceptions::NumberFormatException) [static]

Returns a **Integer** (p. 1762) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument. The first argument is interpreted as

representing a signed int in the radix specified by the second argument, exactly as if the argument were given to the parseInt(std::string, int) method. The result is a **Integer** (p. 1762) object that represents the int value specified by the string.

Parameters:

value - std::string to parse as base (radix)

radix - base of the string to parse.

Returns:

new **Integer** (p. 1762) Object wrapping the primitive

Exceptions:

NumberFormatException if the string is not a valid int.

6.339.2.35 static Integer decaf::lang::Integer::valueOf (const std::string & *value*) throw (exceptions::NumberFormatException) [static]

Returns a **Integer** (p. 1762) object holding the value given by the specified std::string. The argument is interpreted as representing a signed decimal int, exactly as if the argument were given to the parseInt(std::string) method. The result is a **Integer** (p. 1762) object that represents the int value specified by the string.

Parameters:

value - std::string to parse as base 10

Returns:

new **Integer** (p. 1762) Object wrapping the primitive

Exceptions:

NumberFormatException if the string is not a decimal int.

6.339.2.36 static Integer decaf::lang::Integer::valueOf (int *value*) [inline, static]

Returns a **Integer** (p. 1762) instance representing the specified int value.

Parameters:

value - the int to wrap

Returns:

the new **Integer** (p. 1762) object wrapping value.

6.339.3 Field Documentation

6.339.3.1 const int decaf::lang::Integer::MAX_VALUE = (int)0x7FFFFFFF [static]

The maximum value that the primitive type can hold.

6.339.3.2 const int decaf::lang::Integer::MIN_VALUE = (int)0x80000000 [static]

The minimum value that the primitive type can hold.

6.339.3.3 const int decaf::lang::Integer::SIZE = 32 [static]

The size in bits of the primitive int type.

The documentation for this class was generated from the following file:

6.340.1 Constructor & Destructor Documentation

6.340.1.1 activemq::commands::IntegerResponse::IntegerResponse (const IntegerResponse &) [inline, protected]

6.340.1.2 activemq::commands::IntegerResponse::IntegerResponse ()

6.340.1.3 virtual activemq::commands::IntegerResponse::~IntegerResponse () [virtual]

6.340.2 Member Function Documentation

6.340.2.1 virtual IntegerResponse* activemq::commands::IntegerResponse::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::Response** (p. 2782).

6.340.2.2 virtual void activemq::commands::IntegerResponse::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::Response** (p. 2782).

6.340.2.3 virtual bool activemq::commands::IntegerResponse::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::Response** (p. 2782).

6.340.2.4 virtual unsigned char activemq::commands::IntegerResponse::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Reimplemented from **activemq::commands::Response** (p. 2783).

6.340.2.5 virtual int activemq::commands::IntegerResponse::getResult () const [virtual]

6.340.2.6 IntegerResponse& activemq::commands::IntegerResponse::operator= (const IntegerResponse &) [inline, protected]

6.340.2.7 virtual void activemq::commands::IntegerResponse::setResult (int *result*) [virtual]

6.340.2.8 virtual std::string activemq::commands::IntegerResponse::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::Response** (p. 2783).

6.340.3 Field Documentation

6.340.3.1 const unsigned char activemq::commands::IntegerResponse::ID_INTEGERRESPONSE = 34 [static]

6.340.3.2 int activemq::commands::IntegerResponse::result [protected]

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.341.1 Detailed Description

Marshaling code for Open Wire Format for **IntegerResponseMarshaller** (p. 1780). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.341.2 Constructor & Destructor Documentation

6.341.2.1 activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::IntegerRespons() [inline]

6.341.2.2 virtual activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::~IntegerRespon() [inline, virtual]

6.341.3 Member Function Documentation

6.341.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2792).

6.341.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::getDataStructure() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2792).

6.341.3.3 virtual void activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2792).

6.341.3.4 virtual void activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2793).

6.341.3.5 virtual int activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2793).

6.341.3.6 virtual void activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2794).

6.341.3.7 virtual void activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2795).

The documentation for this class was generated from the following file:

6.342.2.1 activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::IntegerResponse () [inline]

6.342.2.2 virtual activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::~IntegerRespon () [inline, virtual]

6.342.3 Member Function Documentation

6.342.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2807).

6.342.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::getDataStructure () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2807).

6.342.3.3 virtual void activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2807).

6.342.3.4 virtual void activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2808).

6.342.3.5 virtual int activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2808).

6.342.3.6 virtual void activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2809).

6.342.3.7 virtual void activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.345.1 Detailed Description

Marshaling code for Open Wire Format for **IntegerResponseMarshaller** (p. 1796). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.345.2 Constructor & Destructor Documentation

6.345.2.1 activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::IntegerRespons() [inline]

6.345.2.2 virtual activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::~IntegerRespon() [inline, virtual]

6.345.3 Member Function Documentation

6.345.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2802).

6.345.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::getDataStructure() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2802).

6.345.3.3 virtual void activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2802).

6.345.3.4 virtual void activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2803).

6.345.3.5 virtual int activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2803).

6.345.3.6 virtual void activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2804).

6.345.3.7 virtual void activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2805).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v5/**IntegerResponseMarshaller.h**

6.346 activemq::transport::mock::InternalCommandListener Class Reference

Listens for Commands sent from the **MockTransport** (p. 2371).

`#include <src/main/activemq/transport/mock/InternalCommandListener.h>`Inheritance diagram for activemq::transport::mock::InternalCommandListener:

Public Member Functions

- **InternalCommandListener** ()
- virtual ~**InternalCommandListener** ()
- void **setTransport** (**MockTransport** *transport)
- void **setResponseBuilder** (const **Pointer**< **ResponseBuilder** > &responseBuilder)
- virtual void **onCommand** (const **Pointer**< **Command** > &command)

  Event handler for the receipt of a command.

- void **run** ()

6.346.1 Detailed Description

Listens for Commands sent from the **MockTransport** (p. 2371). This class processes all outbound commands and sends responses that are constructed by calling the Protocol provided **ResponseBuilder** (p. 2785) and getting a set of Commands to send back into the **MockTransport** (p. 2371) as incoming Commands and Responses.

6.346.2 Constructor & Destructor Documentation

6.346.2.1 activemq::transport::mock::InternalCommandListener::InternalCommandListener ()

6.346.2.2 virtual activemq::transport::mock::InternalCommandListener::~InternalCommandListener () `[virtual]`

6.346.3 Member Function Documentation

6.346.3.1 virtual void activemq::transport::mock::InternalCommandListener::onCommand (const Pointer< Command > & *command*) `[virtual]`

Event handler for the receipt of a command. The transport passes off all received commands to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 3273) deletes the command upon receipt.

Parameters:

command the received command object.

Implements **activemq::transport::TransportListener** (p. 3289).

6.346.3.2 void activemq::transport::mock::InternalCommandListener::run ()

6.346.3.3 void activemq::transport::mock::InternalCommandListener::setResponseBuilder (const Pointer< ResponseBuilder > & *responseBuilder*) [inline]

6.346.3.4 void activemq::transport::mock::InternalCommandListener::setTransport (MockTransport * *transport*) [inline]

The documentation for this class was generated from the following file:

- src/main/activemq/transport/mock/**InternalCommandListener.h**

6.347 decaf::lang::exceptions::InterruptedException Class Reference

`#include <src/main/decaf/lang/exceptions/InterruptedException.h>`Inheritance diagram for decaf::lang::exceptions::InterruptedException:

Public Member Functions

- **InterruptedException** () throw ()
  Default Constructor.
- **InterruptedException** (const **Exception** &ex) throw ()
  *Conversion Constructor from some other **Exception** (p. 1574).*
- **InterruptedException** (const **InterruptedException** &ex) throw ()
  Copy Constructor.
- **InterruptedException** (const char *file, const int lineNumber, const std::exception ***cause**, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- **InterruptedException** (const std::exception ***cause**) throw ()
  Constructor.
- **InterruptedException** (const char *file, const int lineNumber, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **InterruptedException** * **clone** () const
  Clones this exception.
- virtual ~**InterruptedException** () throw ()

6.347.1 Constructor & Destructor Documentation

6.347.1.1 decaf::lang::exceptions::InterruptedException::InterruptedException () throw () [inline]

Default Constructor.

6.347.1.2 decaf::lang::exceptions::InterruptedException::InterruptedException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1574).

Parameters:

ex The **Exception** (p. 1574) whose data is to be copied into this one.

6.347.1.3 decaf::lang::exceptions::InterruptedException::InterruptedException (const InterruptedException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex The **Exception** (p. 1574) whose data is to be copied into this one.

6.347.1.4 decaf::lang::exceptions::InterruptedException::InterruptedException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.347.1.5 decaf::lang::exceptions::InterruptedException::InterruptedException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause **Pointer** (p. 2497) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.347.1.6 decaf::lang::exceptions::InterruptedException::InterruptedException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.347.1.7 virtual decaf::lang::exceptions::InterruptedException::~InterruptedException () throw () [inline, virtual]

6.347.2 Member Function Documentation

6.347.2.1 virtual InterruptedException* decaf::lang::exceptions::InterruptedException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1574) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1577).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**InterruptedException.h**

6.348 decaf::io::InterruptedIOException Class Reference

`#include <src/main/decaf/io/InterruptedIOException.h>`Inheritance diagram for decaf::io::InterruptedIOException:

Public Member Functions

- **InterruptedIOException** (const **InterruptedIOException** &ex) throw ()
  Copy Constructor.
- **InterruptedIOException** (const char *file, const int lineNumber, const std::exception ***cause**, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- **InterruptedIOException** (const std::exception ***cause**) throw ()
  Constructor.
- **InterruptedIOException** (const char *file, const int lineNumber, const char *msg,...) throw ()
  Constructor.
- virtual **InterruptedIOException** * **clone** () const
  Clones this exception.
- virtual ~**InterruptedIOException** () throw ()

6.348.1 Constructor & Destructor Documentation

6.348.1.1 decaf::io::InterruptedIOException::InterruptedIOException () throw () [inline]

Default Constructor.

6.348.1.2 decaf::io::InterruptedIOException::InterruptedIOException (const lang::Exception & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex the exception to copy

6.348.1.3 decaf::io::InterruptedIOException::InterruptedIOException (const InterruptedIOException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex the exception to copy, which is an instance of this type

6.348.1.4 decaf::io::InterruptedIOException::InterruptedIOException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.348.1.5 decaf::io::InterruptedIOException::InterruptedIOException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.348.1.6 decaf::io::InterruptedIOException::InterruptedIOException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.348.1.7 virtual decaf::io::InterruptedIOException::~InterruptedIOException () throw () [inline, virtual]

6.348.2 Member Function Documentation

6.348.2.1 virtual InterruptedIOException* decaf::io::InterruptedIOException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new exception that is a copy of this one.

Reimplemented from **decaf::io::IOException** (p. 1822).

Reimplemented in **decaf::net::SocketTimeoutException** (p. 2992).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**InterruptedIOException.h**

6.349 cms::InvalidClientIdException Class Reference

This exception must be thrown when a client attempts to set a connection's client ID to a value that is rejected by a provider.

  Clones this exception.
- virtual ~**InvalidKeyException** () throw ()

6.351.1 Constructor & Destructor Documentation

6.351.1.1 decaf::security::InvalidKeyException::InvalidKeyException () throw () [inline]

Default Constructor.

6.351.1.2 decaf::security::InvalidKeyException::InvalidKeyException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.351.1.3 decaf::security::InvalidKeyException::InvalidKeyException (const InvalidKeyException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.351.1.4 decaf::security::InvalidKeyException::InvalidKeyException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.351.1.5 decaf::security::InvalidKeyException::InvalidKeyException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.351.1.6 decaf::security::InvalidKeyException::InvalidKeyException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occured. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.351.1.7 virtual decaf::security::InvalidKeyException::~InvalidKeyException () throw () [inline, virtual]

6.351.2 Member Function Documentation

6.351.2.1 virtual InvalidKeyException* decaf::security::InvalidKeyException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented from **decaf::security::KeyException** (p. 1957).

The documentation for this class was generated from the following file:

- src/main/decaf/security/**InvalidKeyException.h**

6.354.1 Constructor & Destructor Documentation

6.354.1.1 decaf::lang::exceptions::InvalidStateException::InvalidStateException () throw () `[inline]`

Default Constructor.

6.354.1.2 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const Exception & *ex*) throw () `[inline]`

Conversion Constructor from some other **Exception** (p. 1574).

Parameters:

ex The **Exception** (p. 1574) whose data is to be copied into this one.

6.354.1.3 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const InvalidStateException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex The **Exception** (p. 1574) whose data is to be copied into this one.

6.354.1.4 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.354.1.5 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause **Pointer** (p. 2497) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.354.1.6 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.354.1.7 virtual decaf::lang::exceptions::InvalidStateException::~InvalidStateException () throw () [inline, virtual]

6.354.2 Member Function Documentation

6.354.2.1 virtual InvalidStateException* decaf::lang::exceptions::InvalidStateException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

an new **Exception** (p. 1574) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1577).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**InvalidStateException.h**

6.355.1 Constructor & Destructor Documentation

6.355.1.1 decaf::io::IOException::IOException () throw () `[inline]`

Default Constructor.

6.355.1.2 decaf::io::IOException::IOException (const lang::Exception & *ex*) throw () `[inline]`

Copy Constructor.

Parameters:

ex the exception to copy

6.355.1.3 decaf::io::IOException::IOException (const IOException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex the exception to copy, which is an instance of this type

6.355.1.4 decaf::io::IOException::IOException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.355.1.5 decaf::io::IOException::IOException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.355.1.6 decaf::io::IOException::IOException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor.

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.355.1.7 virtual decaf::io::IOException::~IOException () throw () [inline, virtual]

6.355.2 Member Function Documentation

6.355.2.1 virtual IOException* decaf::io::IOException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new instance of an Exception that is a copy of this instance.

Reimplemented from **decaf::lang::Exception** (p. 1577).

Reimplemented in **decaf::io::EOFException** (p. 1573), **decaf::io::InterruptedIOException** (p. 1807), **decaf::io::UnsupportedEncodingException** (p. 3302), **decaf::io::UTFDataFormatException** (p. 3355), **decaf::net::BindException** (p. 723), **decaf::net::ConnectException** (p. 1130), **decaf::net::HttpRetryException** (p. 1719), **decaf::net::MalformedURLException** (p. 2093), **decaf::net::NoRouteToHostException** (p. 2419), **decaf::net::PortUnreachableException** (p. 2524), **decaf::net::ProtocolException** (p. 2669), **decaf::net::SocketException** (p. 2973), **decaf::net::SocketTimeoutException** (p. 2992), **decaf::net::UnknownHostException** (p. 3296), and **decaf::net::UnknownServiceException** (p. 3299).

  reconnect to another location

6.356.1 Detailed Description

Implementation of the **Transport** (p. 3273) interface that performs marshaling of commands to IO streams. This class does not implement the request method, it only handles oneway messages. A thread polls on the input stream for in-coming commands. When a command is received, the command listener is notified. The polling thread is not started until the start method is called. The close method will close the associated streams. Close can be called explicitly by the user, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

6.356.2 Constructor & Destructor Documentation

6.356.2.1 activemq::transport::IOTransport::IOTransport ()

Default Constructor.

6.356.2.2 activemq::transport::IOTransport::IOTransport (const Pointer< wireformat::WireFormat > & *wireFormat*)

Create an instance of this **Transport** (p. 3273) and assign its WireFormat instance at creation time.

Parameters:

wireFormat Data encoder / decoder to use when reading and writing.

6.356.2.3 virtual activemq::transport::IOTransport::~IOTransport () [virtual]

6.356.3 Member Function Documentation

6.356.3.1 virtual void activemq::transport::IOTransport::close () throw (decaf::io::IOException) [virtual]

Stops the polling thread and closes the streams. This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

Exceptions:

IOException if errors occur.

Implements **decaf::io::Closeable** (p. 1019).

6.356.3.2 virtual std::string activemq::transport::IOTransport::getRemoteAddress () const [inline, virtual]

Returns:

the remote address for this connection

Implements **activemq::transport::Transport** (p. 3274).

6.356.3.3 virtual TransportListener* activemq::transport::IOTransport::getTransportListener () const [inline, virtual]

Gets the observer of asynchronous exceptions from this transport.

Returns:

The listener of transport events.

Implements **activemq::transport::Transport** (p. 3274).

6.356.3.4 virtual bool activemq::transport::IOTransport::isClosed () const [inline, virtual]

Has the **Transport** (p. 3273) been shutdown and no longer usable.

Returns:

true if the **Transport** (p. 3273)

Implements **activemq::transport::Transport** (p. 3275).

6.356.3.5 virtual bool activemq::transport::IOTransport::isConnected () const [inline, virtual]

Is the **Transport** (p. 3273) Connected to its Broker.

Returns:

true if a connection has been made.

Implements **activemq::transport::Transport** (p. 3275).

6.356.3.6 virtual bool activemq::transport::IOTransport::isFaultTolerant () const [inline, virtual]

Is this **Transport** (p. 3273) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns:

true if the **Transport** (p. 3273) is fault tolerant.

Implements **activemq::transport::Transport** (p. 3275).

6.356.3.7 virtual Transport* activemq::transport::IOTransport::narrow (const std::type_info & *typeId*) [inline, virtual]

Narrows down a Chain of Transports to a specific **Transport** (p. 3273) to allow a higher level transport to skip intermediate Transports in certain circumstances.

Parameters:

typeId - The type_info of the Object we are searching for.

Returns:

the requested Object. or NULL if its not in this chain.

Implements **activemq::transport::Transport** (p. 3275).

6.356.3.8 virtual void activemq::transport::IOTransport::oneway (const Pointer< Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command the command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 3276).

6.356.3.9 virtual void activemq::transport::IOTransport::reconnect (const decaf::net::URI &uri *AMQCPP_UNUSED*) throw (decaf::io::IOException) [inline, virtual]

reconnect to another location

Parameters:

uri

Exceptions:

IOException on failure of if not supported

6.356.3.10 virtual Pointer<Response> activemq::transport::IOTransport::request (const Pointer< Command > & *command*, unsigned int *timeout*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Not supported by this class - throws an exception.

Parameters:

command the command to be sent.

timeout the time to wait for a response.

Returns:

the response to the command sent.

Exceptions:

UnsupportedOperationException.

Implements **activemq::transport::Transport** (p. 3276).

6.356.3.11 virtual Pointer<Response> activemq::transport::IOTransport::request (const Pointer< Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Not supported by this class - throws an exception.

Parameters:

command the command to be sent.

Returns:

the response to the command sent.

Exceptions:

UnsupportedOperationException.

Implements **activemq::transport::Transport** (p. 3277).

6.356.3.12 virtual void activemq::transport::IOTransport::run () [virtual]

Runs the polling thread.

Implements **decaf::lang::Runnable** (p. 2816).

6.356.3.13 virtual void activemq::transport::IOTransport::setInputStream (decaf::io::DataInputStream * *is*) [inline, virtual]

Sets the input stream for in-coming commands.

Parameters:

is The input stream.

6.356.3.14 virtual void activemq::transport::IOTransport::setOutputStream (decaf::io::DataOutputStream * *os*) [inline, virtual]

Sets the output stream for out-going commands.

Parameters:

os The output stream.

6.356.3.15 virtual void activemq::transport::IOTransport::setTransportListener (TransportListener * *listener*) [inline, virtual]

Sets the observer of asynchronous exceptions from this transport.

Parameters:

listener the listener of transport events.

Implements **activemq::transport::Transport** (p. 3277).

6.356.3.16 virtual void activemq::transport::IOTransport::setWireFormat (const Pointer< wireformat::WireFormat > & *wireFormat*) [inline, virtual]

Sets the WireFormat instance to use.

Parameters:

wireFormat The WireFormat the object used to encode / decode commands.

Implements **activemq::transport::Transport** (p. 3278).

6.356.3.17 virtual void activemq::transport::IOTransport::start () throw (decaf::io::IOException) [virtual]

Starts this transport object and creates the thread for polling on the input stream for commands. If this object has been closed, throws an exception. Before calling start, the caller must set the IO streams and the reader and writer objects.

Exceptions:

CMSException if an error occurs or if this transport has already been closed.

Implements **activemq::transport::Transport** (p. 3278).

6.356.3.18 virtual void activemq::transport::IOTransport::stop () throw (decaf::io::IOException) [virtual]

Stops the **Transport** (p. 3273), terminating any threads and stopping all read and write operations.

Exceptions:

IOException if an error occurs while stopping the **Transport** (p. 3273).

Implements **activemq::transport::Transport** (p. 3278).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Iterable.h**

6.358 decaf::util::Iterator< T > Class Template Reference

Defines an object that can be used to iterate over the elements of a collection.

`#include <src/main/decaf/util/Iterator.h>`Inheritance diagram for decaf::util::Iterator< T >:

Public Member Functions

- virtual ~**Iterator** ()
- virtual T **next** ()=0 throw (lang::exceptions::NoSuchElementException)

  Returns the next element in the iteration.

- virtual bool **hasNext** () const =0

  Returns true if the iteration has more elements.

- virtual void **remove** ()=0 throw (lang::exceptions::IllegalStateException, lang::exceptions::UnsupportedOperationException)

  Removes from the underlying collection the last element returned by the iterator (optional operation).

6.358.1 Detailed Description

template<typename T> class decaf::util::Iterator< T >

Defines an object that can be used to iterate over the elements of a collection. The iterator provides a way to access and remove elements with well defined semantics.

6.358.2 Constructor & Destructor Documentation

6.358.2.1 template<typename T> virtual decaf::util::Iterator< T >::~Iterator () [inline, virtual]

6.358.3 Member Function Documentation

6.358.3.1 template<typename T> virtual bool decaf::util::Iterator< T >::hasNext () const [pure virtual]

Returns true if the iteration has more elements. Returns false if the next call to next would result in an NoSuchElementException to be thrown.

6.358.3.2 template<typename T> virtual T decaf::util::Iterator< T >::next () throw (lang::exceptions::NoSuchElementException) [pure virtual]

Returns the next element in the iteration. Calling this method repeatedly until the **hasNext()** (p. 1832) method returns false will return each element in the underlying collection exactly once.

Returns:

next element in the iteration of elements

Exceptions:

NoSuchElementException - iteration has no more elements.

6.358.3.3 template<typename T> virtual void decaf::util::Iterator< T >::remove () throw (lang::exceptions::IllegalStateException, lang::exceptions::UnsupportedOperationException) [pure virtual]

Removes from the underlying collection the last element returned by the iterator (optional operation). This method can be called only once per call to next. The behavior of an iterator is unspecified if the underlying collection is modified while the iteration is in progress in any way other than by calling this method.

Exceptions:

UnsupportedOperationException - if the remove operation is not supported by this **Iterator** (p. 1832).

IllegalStateException - if the next method has not yet been called, or the remove method has already been called after the last call to the next method.

The documentation for this class was generated from the following file:

6.359.2 Member Function Documentation

6.359.2.1 virtual JournalQueueAck* activemq::commands::JournalQueueAck::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.359.2.2 virtual void activemq::commands::JournalQueueAck::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Implements **activemq::commands::DataStructure** (p. 1462).

6.359.2.3 virtual bool activemq::commands::JournalQueueAck::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1463).

6.359.2.4 virtual unsigned char activemq::commands::JournalQueueAck::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.359.2.5 virtual Pointer<ActiveMQDestination>& activemq::commands::JournalQueueAck::getDestination () [virtual]

6.359.2.6 virtual const Pointer<ActiveMQDestination>& activemq::commands::JournalQueueAck::getDestination () const [virtual]

Marshaling code for Open Wire Format for **JournalQueueAckMarshaller** (p. 1838).

`#include <src/main/activemq/wireformat/openwire/marshal/v2/JournalQueueAckMarshaller.h>`Inheritanc diagram for activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller:

Public Member Functions

- **JournalQueueAckMarshaller** ()
- virtual ~**JournalQueueAckMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.360.1 Detailed Description

Marshaling code for Open Wire Format for **JournalQueueAckMarshaller** (p. 1838). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.360.2 Constructor & Destructor Documentation

6.360.2.1 activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::JournalQueueA () [inline]

6.360.2.2 virtual activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::~JournalQueu () [inline, virtual]

6.360.3 Member Function Documentation

6.360.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.360.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::getDataStructure () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.360.3.3 virtual void activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.360.3.4 virtual void activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.360.3.5 virtual int activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.360.3.6 virtual void activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.360.3.7 virtual void activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

  Write a object instance to data output stream.

6.361.1 Detailed Description

Marshaling code for Open Wire Format for **JournalQueueAckMarshaller** (p. 1842). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.361.2 Constructor & Destructor Documentation

6.361.2.1 activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::JournalQueueA () [inline]

6.361.2.2 virtual activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::~JournalQueu () [inline, virtual]

6.361.3 Member Function Documentation

6.361.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.361.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::getDataStructure () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.361.3.3 virtual void activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.361.3.4 virtual void activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.361.3.5 virtual int activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.361.3.6 virtual void activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.361.3.7 virtual void activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.364.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::JournalQueueAckMarshaller::getDataStructure () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.364.3.3 virtual void activemq::wireformat::openwire::marshal::v5::JournalQueueAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.364.3.4 virtual void activemq::wireformat::openwire::marshal::v5::JournalQueueAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.364.3.5 virtual int activemq::wireformat::openwire::marshal::v5::JournalQueueAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.364.3.6 virtual void activemq::wireformat::openwire::marshal::v5::JournalQueueAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.364.3.7 virtual void activemq::wireformat::openwire::marshal::v5::JournalQueueAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

6.365.1 Constructor & Destructor Documentation

6.365.1.1 activemq::commands::JournalTopicAck::JournalTopicAck (const JournalTopicAck &) [inline, protected]

6.365.1.2 activemq::commands::JournalTopicAck::JournalTopicAck ()

6.365.1.3 virtual activemq::commands::JournalTopicAck::~JournalTopicAck () [virtual]

6.365.2 Member Function Documentation

6.365.2.1 virtual JournalTopicAck* activemq::commands::JournalTopicAck::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.365.2.2 virtual void activemq::commands::JournalTopicAck::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Implements **activemq::commands::DataStructure** (p. 1462).

6.365.2.3 virtual bool activemq::commands::JournalTopicAck::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1463).

6.365.2.4 virtual std::string& activemq::commands::JournalTopicAck::getClientId () [virtual]

6.365.2.5 virtual const std::string& activemq::commands::JournalTopicAck::getClientId () const [virtual]

6.365.2.6 virtual unsigned char activemq::commands::JournalTopicAck::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.365.2.7 virtual Pointer<ActiveMQDestination>& activemq::commands::JournalTopicAck::getDestination () [virtual]

6.365.2.8 virtual const Pointer<ActiveMQDestination>& activemq::commands::JournalTopicAck::getDestination () const [virtual]

6.366.3 Member Function Documentation

6.366.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.366.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::getDataStructure () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.366.3.3 virtual void activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.366.3.4 virtual void activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.366.3.5 virtual int activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.366.3.6 virtual void activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.366.3.7 virtual void activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.368.3.4 virtual void activemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.368.3.5 virtual int activemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.368.3.6 virtual void activemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.368.3.7 virtual void activemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

6.369.3 Member Function Documentation

6.369.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::JournalTopicAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.369.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::JournalTopicAckMarshaller::getDataStructure () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.369.3.3 virtual void activemq::wireformat::openwire::marshal::v4::JournalTopicAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.369.3.4 virtual void activemq::wireformat::openwire::marshal::v4::JournalTopicAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.369.3.5 virtual int activemq::wireformat::openwire::marshal::v4::JournalTopicAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.369.3.6 virtual void activemq::wireformat::openwire::marshal::v4::JournalTopicAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.369.3.7 virtual void activemq::wireformat::openwire::marshal::v4::JournalTopicAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

6.370.3 Member Function Documentation

6.370.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.370.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::getDataStructure () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.370.3.3 virtual void activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.370.3.4 virtual void activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.370.3.5 virtual int activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.370.3.6 virtual void activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.370.3.7 virtual void activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

6.371.1 Constructor & Destructor Documentation

6.371.1.1 activemq::commands::JournalTrace::JournalTrace (const JournalTrace &) [inline, protected]

6.371.1.2 activemq::commands::JournalTrace::JournalTrace ()

6.371.1.3 virtual activemq::commands::JournalTrace::~JournalTrace () [virtual]

6.371.2 Member Function Documentation

6.371.2.1 virtual JournalTrace* activemq::commands::JournalTrace::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.371.2.2 virtual void activemq::commands::JournalTrace::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Implements **activemq::commands::DataStructure** (p. 1462).

6.371.2.3 virtual bool activemq::commands::JournalTrace::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1463).

6.371.2.4 virtual unsigned char activemq::commands::JournalTrace::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.371.2.5 virtual std::string& activemq::commands::JournalTrace::getMessage () [virtual]

6.371.2.6 virtual const std::string& activemq::commands::JournalTrace::getMessage () const [virtual]

6.372.3 Member Function Documentation

6.372.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.372.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::getDataStructureTyp () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.372.3.3 virtual void activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.372.3.4 virtual void activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.372.3.5 virtual int activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.372.3.6 virtual void activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.372.3.7 virtual void activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

  Write a object instance to data output stream.

6.373.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTraceMarshaller** (p. 1890). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.373.2 Constructor & Destructor Documentation

6.373.2.1 activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::JournalTraceMarsh () [inline]

6.373.2.2 virtual activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::~JournalTraceMars () [inline, virtual]

6.373.3 Member Function Documentation

6.373.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.373.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::getDataStructureTyp () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.373.3.3 virtual void activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.373.3.4 virtual void activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.373.3.5 virtual int activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.373.3.6 virtual void activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.373.3.7 virtual void activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

The documentation for this class was generated from the following file:

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.374.3.5 virtual int activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.374.3.6 virtual void activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.374.3.7 virtual void activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

6.375.2.2 virtual activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::~JournalTraceMars () [inline, virtual]

6.375.3 Member Function Documentation

6.375.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.375.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::getDataStructureTyp () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.375.3.3 virtual void activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.375.3.4 virtual void activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.375.3.5 virtual int activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.375.3.6 virtual void activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.375.3.7 virtual void activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

6.376.3 Member Function Documentation

6.376.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.376.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::getDataStructureTyp () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.376.3.3 virtual void activemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.376.3.4 virtual void activemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.376.3.5 virtual int activemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.376.3.6 virtual void activemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.376.3.7 virtual void activemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

6.377.2 Member Function Documentation

6.377.2.1 virtual JournalTransaction* activemq::commands::JournalTransaction::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.377.2.2 virtual void activemq::commands::JournalTransaction::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Implements **activemq::commands::DataStructure** (p. 1462).

6.377.2.3 virtual bool activemq::commands::JournalTransaction::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1463).

6.377.2.4 virtual unsigned char activemq::commands::JournalTransaction::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.377.2.5 virtual Pointer<TransactionId>& activemq::commands::JournalTransaction::getTransactionId () [virtual]

6.377.2.6 virtual const Pointer<TransactionId>& activemq::commands::JournalTransaction::getTransactionId () const [virtual]

6.377.2.11 virtual void activemq::commands::JournalTransaction::setType (unsigned char *type*) [virtual]

6.377.2.12 virtual void activemq::commands::JournalTransaction::setWasPrepared (bool *wasPrepared*) [virtual]

6.377.2.13 virtual std::string activemq::commands::JournalTransaction::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 718).

6.378.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTransactionMarshaller** (p. 1910). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.378.2 Constructor & Destructor Documentation

6.378.2.1 activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::JournalTrans () [inline]

6.378.2.2 virtual activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::~JournalTra () [inline, virtual]

6.378.3 Member Function Documentation

6.378.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.378.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::getDataStructu () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.378.3.3 virtual void activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.378.3.4 virtual void activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::looseUnmarsha (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.378.3.5 virtual int activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.378.3.6 virtual void activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.378.3.7 virtual void activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

The documentation for this class was generated from the following file:

6.379.3 Member Function Documentation

6.379.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.379.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::getDataStructu () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.379.3.3 virtual void activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.379.3.4 virtual void activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::looseUnmarsha (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.379.3.5 virtual int activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.379.3.6 virtual void activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.379.3.7 virtual void activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::tightUnmarsha (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.381.3.6 virtual void activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.381.3.7 virtual void activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::tightUnmarsha (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

Marshaling code for Open Wire Format for **JournalTransactionMarshaller** (p. 1926). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.382.2 Constructor & Destructor Documentation

6.382.2.1 activemq::wireformat::openwire::marshal::v5::JournalTransactionMarshaller::JournalTrans () [inline]

6.382.2.2 virtual activemq::wireformat::openwire::marshal::v5::JournalTransactionMarshaller::~JournalTra () [inline, virtual]

6.382.3 Member Function Documentation

6.382.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::JournalTransactionMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.382.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::JournalTransactionMarshaller::getDataStructu () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.382.3.3 virtual void activemq::wireformat::openwire::marshal::v5::JournalTransactionMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.382.3.4 virtual void activemq::wireformat::openwire::marshal::v5::JournalTransactionMarshaller::looseUnmarsha (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.382.3.5 virtual int activemq::wireformat::openwire::marshal::v5::JournalTransactionMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.382.3.6 virtual void activemq::wireformat::openwire::marshal::v5::JournalTransactionMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.382.3.7 virtual void activemq::wireformat::openwire::marshal::v5::JournalTransactionMarshaller::tightUnmarsha (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v5/**JournalTransactionMarshaller.h**

6.383 activemq::commands::KeepAliveInfo Class Reference

`#include <src/main/activemq/commands/KeepAliveInfo.h>`Inheritance diagram for activemq::commands::KeepAliveInfo:

Public Member Functions

- **KeepAliveInfo** ()
- virtual ~**KeepAliveInfo** ()
- virtual unsigned char **getDataStructureType** () const

  Get the unique identifier that this object and its own Marshaler share.

- virtual **KeepAliveInfo** * **cloneDataStructure** () const

  Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

  Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure*** (p. *1461) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure*** (p. *1461) passed in to this one, and returns if they are equivalent.*

- virtual bool **isKeepAliveInfo** () const
- virtual **Pointer**< **Command** > **visit** (**activemq::state::CommandVisitor** *visitor) throw (exceptions::ActiveMQException)

  Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_KEEPALIVEINFO** = 10

Protected Member Functions

- **KeepAliveInfo** (const **KeepAliveInfo** &)
- **KeepAliveInfo** & **operator**= (const **KeepAliveInfo** &)

6.383.1 Constructor & Destructor Documentation

6.383.1.1 activemq::commands::KeepAliveInfo::KeepAliveInfo (const KeepAliveInfo &) [inline, protected]

6.383.1.2 activemq::commands::KeepAliveInfo::KeepAliveInfo ()

6.383.1.3 virtual activemq::commands::KeepAliveInfo::~KeepAliveInfo () [virtual]

6.383.2 Member Function Documentation

6.383.2.1 virtual KeepAliveInfo* activemq::commands::KeepAliveInfo::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.383.2.2 virtual void activemq::commands::KeepAliveInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.383.2.3 virtual bool activemq::commands::KeepAliveInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.383.2.4 virtual unsigned char activemq::commands::KeepAliveInfo::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.383.2.5 virtual bool activemq::commands::KeepAliveInfo::isKeepAliveInfo () const [inline, virtual]

Returns:

an answer of true to the **isKeepAliveInfo()** (p. 1932) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 653).

6.383.2.6 KeepAliveInfo& activemq::commands::KeepAliveInfo::operator= (const KeepAliveInfo &) [inline, protected]

6.383.2.7 virtual std::string activemq::commands::KeepAliveInfo::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 655).

6.383.2.8 virtual Pointer<Command> activemq::commands::KeepAliveInfo::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1067).

6.383.3 Field Documentation

6.383.3.1 const unsigned char activemq::commands::KeepAliveInfo::ID_KEEPALIVEINFO = 10 [static]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**KeepAliveInfo.h**

6.384 activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarsh Class Reference

Marshaling code for Open Wire Format for **KeepAliveInfoMarshaller** (p. 1933).

`#include <src/main/activemq/wireformat/openwire/marshal/v2/KeepAliveInfoMarshaller.h>`Inheritance diagram for activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller:

Public Member Functions

- **KeepAliveInfoMarshaller** ()
- virtual ~**KeepAliveInfoMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.384.1 Detailed Description

Marshaling code for Open Wire Format for **KeepAliveInfoMarshaller** (p. 1933). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.384.2 Constructor & Destructor Documentation

6.384.2.1 activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::KeepAliveInfoMar () [inline]

6.384.2.2 virtual activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::~KeepAliveInfoM () [inline, virtual]

6.384.3 Member Function Documentation

6.384.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.384.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::getDataStructureTy () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.384.3.3 virtual void activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 686).

6.384.3.4 virtual void activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 687).

6.384.3.5 virtual int activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 688).

6.384.3.6 virtual void activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 689).

6.384.3.7 virtual void activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 690).

6.385.3 Member Function Documentation

6.385.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::KeepAliveInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.385.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::KeepAliveInfoMarshaller::getDataStructureTy () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.385.3.3 virtual void activemq::wireformat::openwire::marshal::v5::KeepAliveInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 679).

6.385.3.4 virtual void activemq::wireformat::openwire::marshal::v5::KeepAliveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 680).

6.385.3.5 virtual int activemq::wireformat::openwire::marshal::v5::KeepAliveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 681).

6.385.3.6 virtual void activemq::wireformat::openwire::marshal::v5::KeepAliveInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 682).

6.385.3.7 virtual void activemq::wireformat::openwire::marshal::v5::KeepAliveInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 683).

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 658).

6.386.3.4 virtual void activemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 659).

6.386.3.5 virtual int activemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 660).

6.386.3.6 virtual void activemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 661).

6.386.3.7 virtual void activemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 662).

6.387.2 Constructor & Destructor Documentation

6.387.2.1 activemq::wireformat::openwire::marshal::v4::KeepAliveInfoMarshaller::KeepAliveInfoMar () [inline]

6.387.2.2 virtual activemq::wireformat::openwire::marshal::v4::KeepAliveInfoMarshaller::~KeepAliveInfoM () [inline, virtual]

6.387.3 Member Function Documentation

6.387.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::KeepAliveInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.387.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::KeepAliveInfoMarshaller::getDataStructureTy () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.387.3.3 virtual void activemq::wireformat::openwire::marshal::v4::KeepAliveInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 672).

6.387.3.4 virtual void activemq::wireformat::openwire::marshal::v4::KeepAliveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 673).

6.387.3.5 virtual int activemq::wireformat::openwire::marshal::v4::KeepAliveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 674).

6.387.3.6 virtual void activemq::wireformat::openwire::marshal::v4::KeepAliveInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 675).

6.387.3.7 virtual void activemq::wireformat::openwire::marshal::v4::KeepAliveInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 676).

The documentation for this class was generated from the following file:

6.388.3 Member Function Documentation

6.388.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.388.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::getDataStructureTy () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.388.3.3 virtual void activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 665).

6.388.3.4 virtual void activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 666).

6.388.3.5 virtual int activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 667).

6.388.3.6 virtual void activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 668).

6.388.3.7 virtual void activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 669).

The documentation for this class was generated from the following file:

6.389 decaf::security::Key Class Reference

The **Key** (p. 1953) interface is the top-level interface for all keys.

`#include <src/main/decaf/security/Key.h>`Inheritance diagram for decaf::security::Key:

Public Member Functions

- virtual ~**Key** ()
- virtual std::string **getAlgorithm** () const =0

  Returns the standard algorithm name for this key.

- virtual void **getEncoded** (std::vector< unsigned char > &output) const =0

  Provides the key in its primary encoding format, or nothing if this key does not support encoding.

- virtual std::string **getFormat** () const =0

  Returns the name of the primary encoding format of this key, or an empty string if this key does not support encoding.

6.389.1 Detailed Description

The **Key** (p. 1953) interface is the top-level interface for all keys. It defines the functionality shared by all key objects. All keys have three characteristics:

An Algorithm

This is the key algorithm for that key. The key algorithm is usually an encryption or asymmetric operation algorithm (such as DSA or RSA), which will work with those algorithms and with related algorithms (such as MD5 with RSA, SHA-1 with RSA, Raw DSA, etc.) The name of the algorithm of a key is obtained using the getAlgorithm method.

An Encoded Form

This is an external encoded form for the key used when a standard representation of the key is needed outside the application, as when transmitting the key to some other party. The key is encoded according to a standard format (such as X.509 SubjectPublicKeyInfo or PKCS#8), and is returned using the getEncoded method. Note: The syntax of the ASN.1 type SubjectPublicKeyInfo is defined as follows:

SubjectPublicKeyInfo ::= SEQUENCE {

algorithm AlgorithmIdentifier,

subjectPublicKey BIT STRING }

AlgorithmIdentifier ::= SEQUENCE {

algorithm OBJECT IDENTIFIER,

parameters ANY DEFINED BY algorithm OPTIONAL }

For more information, see RFC 2459: Internet X.509 Public **Key** (p. 1953) Infrastructure Certificate and CRL Profile.

A Format

This is the name of the format of the encoded key. It is returned by the getFormat method.

6.389.2 Constructor & Destructor Documentation

6.389.2.1 virtual decaf::security::Key::~Key () [inline, virtual]

6.389.3 Member Function Documentation

6.389.3.1 virtual std::string decaf::security::Key::getAlgorithm () const [pure virtual]

Returns the standard algorithm name for this key. For example, "DSA" would indicate that this key is a DSA key.

Returns:

the name of the algorithm associated with this key.

6.389.3.2 virtual void decaf::security::Key::getEncoded (std::vector< unsigned char > & *output*) const [pure virtual]

Provides the key in its primary encoding format, or nothing if this key does not support encoding.

Parameters:

output Receives the encoded key, or nothing if the key does not support encoding.

6.389.3.3 virtual std::string decaf::security::Key::getFormat () const [pure virtual]

Returns the name of the primary encoding format of this key, or an empty string if this key does not support encoding. The primary encoding format is named in terms of the appropriate ASN.1 data format, if an ASN.1 specification for this key exists. For example, the name of the ASN.1 data format for public keys is SubjectPublicKeyInfo, as defined by the X.509 standard; in this case, the returned format is "X.509". Similarly, the name of the ASN.1 data format for private keys is PrivateKeyInfo, as defined by the PKCS #8 standard; in this case, the returned format is "PKCS#8".

Returns:

the primary encoding format of the key.

The documentation for this class was generated from the following file:

- src/main/decaf/security/**Key.h**

6.390 decaf::security::KeyException Class Reference

`#include <src/main/decaf/security/KeyException.h>`Inheritance diagram for decaf::security::KeyException:

Public Member Functions

- **KeyException** () throw ()

  Default Constructor.

- **KeyException** (const Exception &ex) throw ()

  Conversion Constructor from some other Exception.

- **KeyException** (const **KeyException** &ex) throw ()

  Copy Constructor.

- **KeyException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.

- **KeyException** (const std::exception *cause) throw ()

  Constructor.

- **KeyException** (const char *file, const int lineNumber, const char *msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **KeyException** * **clone** () const

  Clones this exception.

- virtual ~**KeyException** () throw ()

6.390.1 Constructor & Destructor Documentation

6.390.1.1 decaf::security::KeyException::KeyException () throw () [inline]

Default Constructor.

6.390.1.2 decaf::security::KeyException::KeyException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.390.1.3 decaf::security::KeyException::KeyException (const KeyException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.390.1.4 decaf::security::KeyException::KeyException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.390.1.5 decaf::security::KeyException::KeyException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.390.1.6 decaf::security::KeyException::KeyException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.390.1.7 virtual decaf::security::KeyException::~KeyException () throw () [inline, virtual]

6.390.2 Member Function Documentation

6.390.2.1 virtual KeyException* decaf::security::KeyException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented from **decaf::security::GeneralSecurityException** (p. 1708).

Reimplemented in **decaf::security::InvalidKeyException** (p. 1812).

The documentation for this class was generated from the following file:

- src/main/decaf/security/**KeyException.h**

6.391 activemq::commands::LastPartialCommand Class Reference

`#include <src/main/activemq/commands/LastPartialCommand.h>`Inheritance diagram for activemq::commands::LastPartialCommand:

Public Member Functions

- **LastPartialCommand** ()
- virtual ~**LastPartialCommand** ()
- virtual unsigned char **getDataStructureType** () const

  Get the unique identifier that this object and its own Marshaler share.

- virtual **LastPartialCommand** * **cloneDataStructure** () const

  Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

  Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure*** (p. *1461) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure*** (p. *1461) passed in to this one, and returns if they are equivalent.*

Static Public Attributes

- static const unsigned char **ID_LASTPARTIALCOMMAND** = 61

Protected Member Functions

- **LastPartialCommand** (const **LastPartialCommand** &)
- **LastPartialCommand** & **operator=** (const **LastPartialCommand** &)

6.391.1 Constructor & Destructor Documentation

6.391.1.1 activemq::commands::LastPartialCommand::LastPartialCommand (const LastPartialCommand &) [inline, protected]

6.391.1.2 activemq::commands::LastPartialCommand::LastPartialCommand ()

6.391.1.3 virtual activemq::commands::LastPartialCommand::~LastPartialCommand () [virtual]

6.391.2 Member Function Documentation

6.391.2.1 virtual LastPartialCommand* activemq::commands::LastPartialCommand::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::PartialCommand** (p. 2474).

6.391.2.2 virtual void activemq::commands::LastPartialCommand::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::PartialCommand** (p. 2474).

6.391.2.3 virtual bool activemq::commands::LastPartialCommand::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::PartialCommand** (p. 2474).

6.391.2.4 virtual unsigned char activemq::commands::LastPartialCommand::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Reimplemented from **activemq::commands::PartialCommand** (p. 2475).

6.391.2.5 LastPartialCommand& activemq::commands::LastPartialCommand::operator= (const LastPartialCommand &) [inline, protected]

6.391.2.6 virtual std::string activemq::commands::LastPartialCommand::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::PartialCommand** (p. 2475).

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.392.1 Detailed Description

Marshaling code for Open Wire Format for **LastPartialCommandMarshaller** (p. 1961). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.392.2 Constructor & Destructor Documentation

6.392.2.1 activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::LastPartial () [inline]

6.392.2.2 virtual activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::~LastParti () [inline, virtual]

6.392.3 Member Function Documentation

6.392.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller** (p. 2478).

6.392.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::getDataStruc () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from **activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller** (p. 2478).

6.392.3.3 virtual void activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller** (p. 2478).

6.392.3.4 virtual void activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::looseUnmarsh (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller** (p. 2479).

6.392.3.5 virtual int activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller** (p. 2479).

6.392.3.6 virtual void activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller** (p. 2480).

6.392.3.7 virtual void activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::tightUnmarsh (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller** (p. 2480).

6.393.3 Member Function Documentation

6.393.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller** (p. 2490).

6.393.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::getDataStruc () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from **activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller** (p. 2490).

6.393.3.3 virtual void activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller** (p. 2490).

6.393.3.4 virtual void activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::looseUnmarsh (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller** (p. 2491).

6.393.3.5 virtual int activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller** (p. 2491).

6.396.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller** (p. 2494).

6.396.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller::getDataStruc () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Reimplemented from **activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller** (p. 2494).

6.396.3.3 virtual void activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller** (p. 2494).

6.396.3.4 virtual void activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller::looseUnmarsh (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller** (p. 2495).

6.396.3.5 virtual int activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller** (p. 2495).

6.396.3.6 virtual void activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller** (p. 2496).

6.396.3.7 virtual void activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller::tightUnmarsh (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller** (p. 2496).

6.397.1 Detailed Description

template<typename E> class decaf::util::comparators::Less< E >

Simple **Less** (p. 1981) **Comparator** (p. 1086) that compares to elements to determine if the first is less than the second. This can be used in **Collection** (p. 1054) classes to sort elements according to their natural ordering. By design the Comparator's compare function return more information about comparison than the STL binary function's boolean compare operator. In this case the compare method will return

Since:

1.0

6.397.2 Constructor & Destructor Documentation

6.397.2.1 template<typename E > decaf::util::comparators::Less< E >::Less () [inline]

6.397.2.2 template<typename E > virtual decaf::util::comparators::Less< E >::~Less () [inline, virtual]

6.397.3 Member Function Documentation

6.397.3.1 template<typename E > virtual int decaf::util::comparators::Less< E >::compare (const E & *o1*, const E & *o2*) const [inline, virtual]

Compares its two arguments for order. Returns a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second.

The implementor must ensure that sgn(compare(x, y)) == -sgn(compare(y, x)) for all x and y. (This implies that compare(x, y) must throw an exception if and only if compare(y, x) throws an exception.)

The implementor must also ensure that the relation is transitive: ((compare(x, y)>0) && (compare(y, z)>0)) implies compare(x, z)>0.

Finally, the implementer must ensure that compare(x, y)==0 implies that sgn(compare(x, z))==sgn(compare(y, z)) for all z.

It is generally the case, but not strictly required that (compare(x, y)==0) == (x == y)). Generally speaking, any comparator that violates this condition should clearly indicate this fact. The recommended language is "Note: this comparator imposes orderings that are inconsistent with equals."

Parameters:

o1 - the first object to be compared

o2 - the second object to be compared

Returns:

a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second.

Implements **decaf::util::Comparator< E >** (p. 1086).

6.397.3.2 template<typename E > virtual bool decaf::util::comparators::Less< E >::operator() (const E & *left*, const E & *right*) const [inline, virtual]

Implementation of the Binary function interface as a means of allowing a **Comparator** (p. 1086) to be passed to an STL **Map** (p. 2094) for use as the sorting criteria.

Parameters:

left - the Left hand side operand.

right - the Right hand side operand.

Returns:

true if the vale of left is less than the value of right.

Implements **decaf::util::Comparator< E >** (p. 1087).

  Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

- virtual E **remove** (std::size_t index)=0 throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException)

  Removes the element at the specified position in this list.

6.399.1 Detailed Description

template<typename E> class decaf::util::List< E >

An ordered collection (also known as a sequence). The user of this interface has precise control over where in the list each element is inserted. The user can access elements by their integer index (position in the list), and search for elements in the list.

Unlike sets, lists typically allow duplicate elements. More formally, lists typically allow pairs of elements e1 and e2 such that e1.equals(e2), and they typically allow multiple null elements if they allow null elements at all. It is not inconceivable that someone might wish to implement a list that prohibits duplicates, by throwing runtime exceptions when the user attempts to insert them, but we expect this usage to be rare.

6.399.2 Constructor & Destructor Documentation

6.399.2.1 template<typename E> virtual decaf::util::List< E >::~List () [inline, virtual]

6.399.3 Member Function Documentation

6.399.3.1 template<typename E> virtual void decaf::util::List< E >::add (std::size_t *index*, const E & *element*) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Inserts the specified element at the specified position in this list. Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters:

index - index at which the specified element is to be inserted

element - element to be inserted

Exceptions:

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

Implemented in **decaf::util::StlList< E >** (p. 3022), **decaf::util::StlList< CompositeTask * >** (p. 3022), **decaf::util::StlList< URI >** (p. 3022), **decaf::util::StlList< Pointer< DestinationInfo > >** (p. 3022), **decaf::util::StlList< PrimitiveValueNode >** (p. 3022), **decaf::util::StlList< Pointer< Command > >** (p. 3022), and **decaf::util::StlList< Pointer< BackupTransport > >** (p. 3022).

6.399.3.2 template<typename E> virtual bool decaf::util::List< E >::addAll (std::size_t *index*, const Collection< E > & *source*) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Inserts all of the elements in the specified collection into this list at the specified position (optional operation). Shifts the element currently at that position (if any) and any subsequent elements to

the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters:

index The index at which to insert the first element from the specified collection

source The **Collection** (p. 1054) containing elements to be added to this list

Returns:

true if this list changed as a result of the call

Exceptions:

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

Implemented in **decaf::util::StlList< E >** (p. 3023), **decaf::util::StlList< CompositeTask * >** (p. 3023), **decaf::util::StlList< URI >** (p. 3023), **decaf::util::StlList< Pointer< DestinationInfo > >** (p. 3023), **decaf::util::StlList< PrimitiveValueNode >** (p. 3023), **decaf::util::StlList< Pointer< Command > >** (p. 3023), and **decaf::util::StlList< Pointer< BackupTransport > >** (p. 3023).

6.399.3.3 template<typename E> virtual E decaf::util::List< E >::get (std::size_t *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Gets the element contained at position passed.

Parameters:

index - position to get

Returns:

value at index

Implemented in **decaf::util::StlList< E >** (p. 3024), **decaf::util::StlList< CompositeTask * >** (p. 3024), **decaf::util::StlList< URI >** (p. 3024), **decaf::util::StlList< Pointer< DestinationInfo > >** (p. 3024), **decaf::util::StlList< PrimitiveValueNode >** (p. 3024), **decaf::util::StlList< Pointer< Command > >** (p. 3024), and **decaf::util::StlList< Pointer< BackupTransport > >** (p. 3024).

6.399.3.4 template<typename E> virtual std::size_t decaf::util::List< E >::indexOf (const E & *value*) throw (decaf::lang::exceptions::NoSuchElementException) [pure virtual]

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element. More formally, returns the lowest index i such that get(i) == value, or -1 if there is no such index.

Parameters:

value - element to search for

Returns:

the index of the first occurrence of the specified element in this list,

Exceptions:

NoSuchElementException if value is not in the list

Implemented in **decaf::util::StlList< E >** (p. 3025), **decaf::util::StlList< CompositeTask * >** (p. 3025), **decaf::util::StlList< URI >** (p. 3025), **decaf::util::StlList< Pointer< DestinationInfo > >** (p. 3025), **decaf::util::StlList< PrimitiveValueNode >** (p. 3025), **decaf::util::StlList< Pointer< Command > >** (p. 3025), and **decaf::util::StlList< Pointer< BackupTransport > >** (p. 3025).

6.399.3.5 template<typename E> virtual size_t decaf::util::List< E >::lastIndexOf (const E & *value*) throw (decaf::lang::exceptions::NoSuchElementException) [pure virtual]

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element. More formally, returns the highest index i such that get(i) == value or -1 if there is no such index.

Parameters:

value - element to search for

Returns:

the index of the last occurrence of the specified element in this list.

Exceptions:

NoSuchElementException if value is not in the list

Implemented in **decaf::util::StlList< E >** (p. 3026), **decaf::util::StlList< CompositeTask * >** (p. 3026), **decaf::util::StlList< URI >** (p. 3026), **decaf::util::StlList< Pointer< DestinationInfo > >** (p. 3026), **decaf::util::StlList< PrimitiveValueNode >** (p. 3026), **decaf::util::StlList< Pointer< Command > >** (p. 3026), and **decaf::util::StlList< Pointer< BackupTransport > >** (p. 3026).

6.399.3.6 template<typename E> virtual ListIterator<E>* decaf::util::List< E >::listIterator (std::size_t *index*) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Implemented in **decaf::util::StlList< E >** (p. 3026), **decaf::util::StlList< CompositeTask * >** (p. 3026), **decaf::util::StlList< URI >** (p. 3026), **decaf::util::StlList< Pointer< DestinationInfo > >** (p. 3026), **decaf::util::StlList< PrimitiveValueNode >** (p. 3026), **decaf::util::StlList< Pointer< Command > >** (p. 3026), and **decaf::util::StlList< Pointer< BackupTransport > >** (p. 3026).

6.399.3.7 template<typename E> virtual ListIterator<E>* decaf::util::List< E >::listIterator (std::size_t *index*) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Parameters:

index index of first element to be returned from the list iterator (by a call to the next method).

Returns:

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions:

IndexOutOfBoundsException if the index is out of range (index < 0 || index > **size()** (p. 1062))

Implemented in **decaf::util::StlList< E >** (p. 3026), **decaf::util::StlList< CompositeTask * >** (p. 3026), **decaf::util::StlList< URI >** (p. 3026), **decaf::util::StlList< Pointer< DestinationInfo > >** (p. 3026), **decaf::util::StlList< PrimitiveValueNode >** (p. 3026), **decaf::util::StlList< Pointer< Command > >** (p. 3026), and **decaf::util::StlList< Pointer< BackupTransport > >** (p. 3026).

6.399.3.8 template<typename E> virtual ListIterator<E>* decaf::util::List< E >::listIterator () const [pure virtual]

Implemented in **decaf::util::StlList< E >** (p. 3027), **decaf::util::StlList< CompositeTask * >** (p. 3027), **decaf::util::StlList< URI >** (p. 3027), **decaf::util::StlList< Pointer< DestinationInfo > >** (p. 3027), **decaf::util::StlList< PrimitiveValueNode >** (p. 3027), **decaf::util::StlList< Pointer< Command > >** (p. 3027), and **decaf::util::StlList< Pointer< BackupTransport > >** (p. 3027).

6.399.3.9 template<typename E> virtual ListIterator<E>* decaf::util::List< E >::listIterator () [pure virtual]

Returns:

a list iterator over the elements in this list (in proper sequence).

Implemented in **decaf::util::StlList< E >** (p. 3027), **decaf::util::StlList< CompositeTask * >** (p. 3027), **decaf::util::StlList< URI >** (p. 3027), **decaf::util::StlList< Pointer< DestinationInfo > >** (p. 3027), **decaf::util::StlList< PrimitiveValueNode >** (p. 3027), **decaf::util::StlList< Pointer< Command > >** (p. 3027), and **decaf::util::StlList< Pointer< BackupTransport > >** (p. 3027).

6.399.3.10 template<typename E> virtual E decaf::util::List< E >::remove (std::size_t *index*) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Removes the element at the specified position in this list. Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters:

index - the index of the element to be removed

Returns:

the element previously at the specified position

Exceptions:

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

Implemented in **decaf::util::StlList< E >** (p. 3027), **decaf::util::StlList< CompositeTask * >** (p. 3027), **decaf::util::StlList< URI >** (p. 3027), **decaf::util::StlList< Pointer< DestinationInfo > >** (p. 3027), **decaf::util::StlList< PrimitiveValueNode >** (p. 3027), **decaf::util::StlList< Pointer< Command > >** (p. 3027), and **decaf::util::StlList< Pointer< BackupTransport > >** (p. 3027).

6.399.3.11 template<typename E> virtual E decaf::util::List< E >::set (std::size_t *index*, const E & *element*) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Replaces the element at the specified position in this list with the specified element.

Parameters:

index - index of the element to replace

element - element to be stored at the specified position

Returns:

the element previously at the specified position

Exceptions:

IndexOutOfBoundsException - if the index is greater than size

Implemented in **decaf::util::StlList< E >** (p. 3028), **decaf::util::StlList< CompositeTask * >** (p. 3028), **decaf::util::StlList< URI >** (p. 3028), **decaf::util::StlList< Pointer< DestinationInfo > >** (p. 3028), **decaf::util::StlList< PrimitiveValueNode >** (p. 3028), **decaf::util::StlList< Pointer< Command > >** (p. 3028), and **decaf::util::StlList< Pointer< BackupTransport > >** (p. 3028).

- virtual bool **hasPrevious** () const =0

  Returns true if this list iterator has more elements when traversing the list in the reverse direction.

- virtual E **previous** ()=0

  Returns the previous element in the list.

- virtual int **nextIndex** () const =0

  Returns the index of the element that would be returned by a subsequent call to next.

- virtual int **previousIndex** () const =0

  Returns the index of the element that would be returned by a subsequent call to previous.

6.400.1 Detailed Description

template<typename E> class decaf::util::ListIterator< E >

An iterator for lists that allows the programmer to traverse the list in either direction, modify the list during iteration, and obtain the iterator's current position in the list. Note that the **remove()** (p. 1833) and set(Object) methods are not defined in terms of the cursor position; they are defined to operate on the last element returned by a call to **next()** (p. 1832) or **previous()** (p. 1992).

6.400.2 Constructor & Destructor Documentation

6.400.2.1 template<typename E > virtual decaf::util::ListIterator< E >::~ListIterator () [inline, virtual]

6.400.3 Member Function Documentation

6.400.3.1 template<typename E > virtual void decaf::util::ListIterator< E >::add (const E & *e*) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IllegalArgumentException) [pure virtual]

Inserts the specified element into the list (optional operation). The element is inserted immediately before the next element that would be returned by next, if any, and after the next element that would be returned by previous, if any. (If the list contains no elements, the new element becomes the sole element on the list.) The new element is inserted before the implicit cursor: a subsequent call to next would be unaffected, and a subsequent call to previous would return the new element. (This call increases by one the value that would be returned by a call to nextIndex or previousIndex.)

Parameters:

e - the element to insert.

Exceptions:

UnsupportedOperationException - if the add method is not supported by this list iterator.

IllegalArgumentException - if some aspect of this element prevents it from being added to this list.

6.400.3.2 template<typename E > virtual bool decaf::util::ListIterator< E >::hasPrevious () const [pure virtual]

Returns true if this list iterator has more elements when traversing the list in the reverse direction. (In other words, returns true if previous would return an element rather than throwing an exception.)

Returns:

true if the list iterator has more elements when traversing the list in the reverse direction.

6.400.3.3 template<typename E > virtual int decaf::util::ListIterator< E >::nextIndex () const [pure virtual]

Returns the index of the element that would be returned by a subsequent call to next. (Returns list size if the list iterator is at the end of the list.)

Returns:

the index of the element that would be returned by a subsequent call to next, or list size if list iterator is at end of list.

6.400.3.4 template<typename E > virtual E decaf::util::ListIterator< E >::previous () [pure virtual]

Returns the previous element in the list. This method may be called repeatedly to iterate through the list backwards, or intermixed with calls to next to go back and forth. (Note that alternating calls to next and previous will return the same element repeatedly.)

Returns:

the previous element in the list.

Exceptions:

NoSuchElementException - if the iteration has no previous element.

6.400.3.5 template<typename E > virtual int decaf::util::ListIterator< E >::previousIndex () const [pure virtual]

Returns the index of the element that would be returned by a subsequent call to previous. (Returns -1 if the list iterator is at the beginning of the list.)

Returns:

the index of the element that would be returned by a subsequent call to previous, or -1 if list iterator is at beginning of list.

6.400.3.6 template<typename E > virtual void decaf::util::ListIterator< E >::set (const E & *e*) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException) [pure virtual]

Replaces the last element returned by next or previous with the specified element (optional operation). This call can be made only if neither **ListIterator.remove** (p. 1833) nor **ListIterator.add** (p. 1991) have been called after the last call to next or previous.

Parameters:

e - the element with which to replace the last element returned by next or previous.

Exceptions:

UnsupportedOperationException - if the add method is not supported by this list iterator.

IllegalArgumentException - if some aspect of this element prevents it from being added to this list.

IllegalStateException - if neither next nor previous have been called, or remove or add have been called after the last call to next or previous.

6.401.3.1 virtual LocalTransactionId* activemq::commands::LocalTransactionId::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Reimplemented from **activemq::commands::TransactionId** (p. 3218).

6.401.3.2 virtual int activemq::commands::LocalTransactionId::compareTo (const LocalTransactionId & *value*) const [virtual]

6.401.3.3 virtual void activemq::commands::LocalTransactionId::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::TransactionId** (p. 3218).

6.401.3.4 virtual bool activemq::commands::LocalTransactionId::equals (const LocalTransactionId & *value*) const [virtual]

6.401.3.5 virtual bool activemq::commands::LocalTransactionId::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::TransactionId** (p. 3218).

6.401.3.6 virtual Pointer<ConnectionId>& activemq::commands::LocalTransactionId::getConnectionId () [virtual]

6.401.3.7 virtual const Pointer<ConnectionId>& activemq::commands::LocalTransactionId::getConnectionId () const [virtual]

6.401.3.8 virtual unsigned char activemq::commands::LocalTransactionId::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Reimplemented from **activemq::commands::TransactionId** (p. 3219).

6.401.3.9 virtual long long activemq::commands::LocalTransactionId::getValue () const [virtual]

6.401.3.10 virtual bool activemq::commands::LocalTransactionId::operator< (const LocalTransactionId & *value*) const [virtual]

6.401.3.11 LocalTransactionId& activemq::commands::LocalTransactionId::operator= (const LocalTransactionId & *other*)

6.401.3.12 virtual bool activemq::commands::LocalTransactionId::operator== (const LocalTransactionId & *value*) const [virtual]

6.401.3.13 virtual void activemq::commands::LocalTransactionId::setConnectionId (const Pointer< ConnectionId > & *connectionId*) [virtual]

6.401.3.14 virtual void activemq::commands::LocalTransactionId::setValue (long long *value*) [virtual]

6.401.3.15 virtual std::string activemq::commands::LocalTransactionId::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::TransactionId** (p. 3219).

6.401.4 Field Documentation

6.401.4.1 Pointer<ConnectionId> activemq::commands::LocalTransactionId::connectionId [protected]

6.401.4.2 const unsigned char activemq::commands::LocalTransactionId::ID_LOCALTRANSACTIONID = 111 [static]

6.401.4.3 long long activemq::commands::LocalTransactionId::value [protected]

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.402.1 Detailed Description

Marshaling code for Open Wire Format for **LocalTransactionIdMarshaller** (p. 1997). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.402.2 Constructor & Destructor Documentation

6.402.2.1 activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::LocalTransac () [inline]

6.402.2.2 virtual activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::~LocalTransa () [inline, virtual]

6.402.3 Member Function Documentation

6.402.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.402.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::getDataStructu () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.402.3.3 virtual void activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 3221).

6.402.3.4 virtual void activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::looseUnmarsha (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 3221).

6.402.3.5 virtual int activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 3222).

6.402.3.6 virtual void activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 3222).

6.402.3.7 virtual void activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 3223).

6.405.2.2 virtual activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller::~LocalTransa () [inline, virtual]

6.405.3 Member Function Documentation

6.405.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.405.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller::getDataStructu () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.405.3.3 virtual void activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller** (p. 3225).

6.405.3.4 virtual void activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller::looseUnmarsha (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller** (p. 3225).

6.405.3.5 virtual int activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller** (p. 3226).

6.405.3.6 virtual void activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller** (p. 3226).

6.405.3.7 virtual void activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller** (p. 3227).

6.406.3 Member Function Documentation

6.406.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.406.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller::getDataStructu () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.406.3.3 virtual void activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller** (p. 3233).

6.406.3.4 virtual void activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller::looseUnmarsha (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller** (p. 3233).

6.406.3.5 virtual int activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller** (p. 3234).

6.406.3.6 virtual void activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller** (p. 3234).

6.406.3.7 virtual void activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller** (p. 3235).

  Acquires the lock unless the current thread is interrupted.

- virtual bool **tryLock** ()=0 throw (decaf::lang::exceptions::RuntimeException)

  Acquires the lock only if it is free at the time of invocation.

- virtual bool **tryLock** (long long time, const **TimeUnit** &unit)=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::InterruptedException)

  Acquires the lock if it is free within the given waiting time and the current thread has not been interrupted.

- virtual void **unlock** ()=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Releases the lock.

- virtual **Condition** * **newCondition** ()=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::UnsupportedOperationException)

  *Returns a new **Condition** (p. 1118) instance that is bound to this **Lock** (p. 2017) instance.*

6.407.1 Detailed Description

Lock (p. 2017) implementations provide more extensive locking operations than can be obtained using synchronized statements. They allow more flexible structuring, may have quite different properties, and may support multiple associated **Condition** (p. 1118) objects.

A lock is a tool for controlling access to a shared resource by multiple threads. Commonly, a lock provides exclusive access to a shared resource: only one thread at a time can acquire the lock and all access to the shared resource requires that the lock be acquired first. However, some locks may allow concurrent access to a shared resource, such as the read lock of a **ReadWriteLock** (p. 2688).

While the scoping mechanism for synchronized statements makes it much easier easier to program with monitor locks, and helps avoid many common programming errors involving locks, there are

occasions where you need to work with locks in a more flexible way. For example, some algorithms for traversing concurrently accessed data structures require the use of "hand-over-hand" or "chain locking": you acquire the lock of node A, then node B, then release A and acquire C, then release B and acquire D and so on. Implementations of the **Lock** (p. 2017) interface enable the use of such techniques by allowing a lock to be acquired and released in different scopes, and allowing multiple locks to be acquired and released in any order.

With this increased flexibility comes additional responsibility. The absence of block-structured locking removes the automatic release of locks that occurs with synchronized statements. In most cases, the following idiom should be used:

Lock (p. 2017) l = ...; l.lock(); try { // access the resource protected by this lock } catch(...) { l.unlock(); }

When locking and unlocking occur in different scopes, care must be taken to ensure that all code that is executed while the lock is held is protected by try-catch ensure that the lock is released when necessary.

Lock (p. 2017) implementations provide additional functionality over the use of synchronized methods and statements by providing a non-blocking attempt to acquire a lock (**tryLock()** (p. 2021)), an attempt to acquire the lock that can be interrupted (**lockInterruptibly()** (p. 2019), and an attempt to acquire the lock that can timeout (tryLock(long, TimeUnit)).

Note that **Lock** (p. 2017) instances are just normal objects and can themselves be used as the target in a synchronized statement.

The three forms of lock acquisition (interruptible, non-interruptible, and timed) may differ in their performance characteristics, ordering guarantees, or other implementation qualities. Further, the ability to interrupt the ongoing acquisition of a lock may not be available in a given **Lock** (p. 2017) class. Consequently, an implementation is not required to define exactly the same guarantees or semantics for all three forms of lock acquisition, nor is it required to support interruption of an ongoing lock acquisition. An implementation is required to clearly document the semantics and guarantees provided by each of the locking methods. It must also obey the interruption semantics as defined in this interface, to the extent that interruption of lock acquisition is supported: which is either totally, or only on method entry.

As interruption generally implies cancellation, and checks for interruption are often infrequent, an implementation can favor responding to an interrupt over normal method return. This is true even if it can be shown that the interrupt occurred after another action may have unblocked the thread. An implementation should document this behavior.

Since:

1.0

6.407.2 Constructor & Destructor Documentation

6.407.2.1 virtual decaf::util::concurrent::locks::Lock::~Lock () [inline, virtual]

6.407.3 Member Function Documentation

6.407.3.1 virtual void decaf::util::concurrent::locks::Lock::lock () throw (decaf::lang::exceptions::RuntimeException) [pure virtual]

Acquires the lock. If the lock is not available then the current thread becomes disabled for thread scheduling purposes and lies dormant until the lock has been acquired.

Implementation Considerations

A **Lock** (p. 2017) implementation may be able to detect erroneous use of the lock, such as an invocation that would cause deadlock, and may throw an exception in such circumstances. The circumstances and the exception type must be documented by that **Lock** (p. 2017) implementation.

Exceptions:

RuntimeException if an error occurs while acquiring the lock.

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 2695).

6.407.3.2 virtual void decaf::util::concurrent::locks::Lock::lockInterruptibly () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::InterruptedException) [pure virtual]

Acquires the lock unless the current thread is interrupted. Acquires the lock if it is available and returns immediately.

If the lock is not available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

∗ The lock is acquired by the current thread; or ∗ Some other thread interrupts the current thread, and interruption of lock acquisition is supported.

If the current thread:

∗ has its interrupted status set on entry to this method; or ∗ is interrupted while acquiring the lock, and interruption of lock acquisition is supported,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

Implementation Considerations

The ability to interrupt a lock acquisition in some implementations may not be possible, and if possible may be an expensive operation. The programmer should be aware that this may be the case. An implementation should document when this is the case.

An implementation can favor responding to an interrupt over normal method return.

A **Lock** (p. 2017) implementation may be able to detect erroneous use of the lock, such as an invocation that would cause deadlock, and may throw an exception in such circumstances. The circumstances and the exception type must be documented by that **Lock** (p. 2017) implementation.

Exceptions:

RuntimeException if an error occurs while acquiring the lock.

InterruptedException if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported).

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 2695).

6.407.3.3 virtual Condition∗ decaf::util::concurrent::locks::Lock::newCondition () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::UnsupportedOperationException) [pure virtual]

Returns a new **Condition** (p. 1118) instance that is bound to this **Lock** (p. 2017) instance. Before waiting on the condition the lock must be held by the current thread. A call to **Condition.await()**

(p. 1120) will atomically release the lock before waiting and re-acquire the lock before the wait returns.

Implementation Considerations

The exact operation of the **Condition** (p. 1118) instance depends on the **Lock** (p. 2017) implementation and must be documented by that implementation.

Returns:

A new **Condition** (p. 1118) instance for this **Lock** (p. 2017) instance the caller must delete the returned **Condition** (p. 1118) object when done with it.

Exceptions:

RuntimeException if an error occurs while creating the **Condition** (p. 1118).

UnsupportedOperationException if this **Lock** (p. 2017) implementation does not support conditions

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 2696).

6.407.3.4 virtual bool decaf::util::concurrent::locks::Lock::tryLock (long long *time*, const TimeUnit & *unit*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::InterruptedException) [pure virtual]

Acquires the lock if it is free within the given waiting time and the current thread has not been interrupted. If the lock is available this method returns immediately with the value true. If the lock is not available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

∗ The lock is acquired by the current thread; or ∗ Some other thread interrupts the current thread, and interruption of lock acquisition is supported; or ∗ The specified waiting time elapses

If the lock is acquired then the value true is returned.

If the current thread:

∗ has its interrupted status set on entry to this method; or ∗ is interrupted while acquiring the lock, and interruption of lock acquisition is supported,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

Implementation Considerations

The ability to interrupt a lock acquisition in some implementations may not be possible, and if possible may be an expensive operation. The programmer should be aware that this may be the case. An implementation should document when this is the case.

An implementation can favor responding to an interrupt over normal method return, or reporting a timeout.

A **Lock** (p. 2017) implementation may be able to detect erroneous use of the lock, such as an invocation that would cause deadlock, and may throw an (unchecked) exception in such circumstances. The circumstances and the exception type must be documented by that **Lock** (p. 2017) implementation.

Parameters:

time the maximum time to wait for the lock

unit the time unit of the time argument

Returns:

true if the lock was acquired and false if the waiting time elapsed before the lock was acquired

Exceptions:

RuntimeException if an error occurs while acquiring the lock.

InterruptedException if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported)

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 2696).

6.407.3.5 virtual bool decaf::util::concurrent::locks::Lock::tryLock () throw (decaf::lang::exceptions::RuntimeException) [pure virtual]

Acquires the lock only if it is free at the time of invocation. Acquires the lock if it is available and returns immediately with the value true. If the lock is not available then this method will return immediately with the value false.

A typical usage idiom for this method would be:

Lock (p. 2017) lock = ...; if (lock.tryLock()) { try { // manipulate protected state } catch(...) { lock.unlock(); } } else { // perform alternative actions }

This usage ensures that the lock is unlocked if it was acquired, and doesn't try to unlock if the lock was not acquired.

Returns:

true if the lock was acquired and false otherwise

Exceptions:

RuntimeException if an error occurs while acquiring the lock.

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 2697).

6.407.3.6 virtual void decaf::util::concurrent::locks::Lock::unlock () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [pure virtual]

Releases the lock. Implementation Considerations

A **Lock** (p. 2017) implementation will usually impose restrictions on which thread can release a lock (typically only the holder of the lock can release it) and may throw an exception if the restriction is violated. Any restrictions and the exception type must be documented by that **Lock** (p. 2017) implementation.

Exceptions:

RuntimeException if an error occurs while acquiring the lock.

IllegalMonitorStateException if the current thread is not the owner of the lock.

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 2698).

Basic thread blocking primitives for creating locks and other synchronization classes.

`#include <src/main/decaf/util/concurrent/locks/LockSupport.h>`

Public Member Functions

- ~**LockSupport** ()

Static Public Member Functions

- static void **unpark** (decaf::lang::Thread *thread) throw ()

  Makes available the permit for the given thread, if it was not already available.

- static void **park** () throw ()

  Disables the current thread for thread scheduling purposes unless the permit is available.

- static void **parkNanos** (long long nanos) throw ()

  Disables the current thread for thread scheduling purposes, for up to the specified waiting time, unless the permit is available.

- static void **parkUntil** (long long deadline) throw ()

  Disables the current thread for thread scheduling purposes, until the specified deadline, unless the permit is available.

6.409.1 Detailed Description

Basic thread blocking primitives for creating locks and other synchronization classes. This class associates, with each thread that uses it, a permit (in the sense of the **Semaphore** (p. 2827) class). A call to park will return immediately if the permit is available, consuming it in the process; otherwise it may block. A call to unpark makes the permit available, if it was not already available. (Unlike with Semaphores though, permits do not accumulate. There is at most one.)

Methods park and unpark provide efficient means of blocking and unblocking threads Races between one thread invoking park and another thread trying to unpark it will preserve liveness, due to the permit. Additionally, park will return if the caller's thread was interrupted, and timeout versions are supported. The park method may also return at any other time, for "no reason", so in general must be invoked within a loop that rechecks conditions upon return. In this sense park serves as an optimization of a "busy wait" that does not waste as much time spinning, but must be paired with an unpark to be effective.

These methods are designed to be used as tools for creating higher-level synchronization utilities, and are not in themselves useful for most concurrency control applications. The park method is designed for use only in constructions of the form:

while (!canProceed()) { ... LockSupport.park(this); }

where neither canProceed nor any other actions prior to the call to park entail locking or blocking. Because only one permit is associated with each thread, any intermediary uses of park could interfere with its intended effects.

Sample Usage. Here is a sketch of a first-in-first-out non-reentrant lock class:

class FIFOMutex { private:

AtomicBoolean locked; ConcurrentLinkedQueue<Thread*> waiters;

public:

void lock() {

bool wasInterrupted = false; Thread* current = Thread::currentThread(); waiters.add(current);

// Block while not first in queue or cannot acquire lock while(waiters.peek() != current || !locked.compareAndSet(false, true)) {

LockSupport.park(this); if(Thread::interrupted()) // ignore interrupts while waiting wasInterrupted = true; }

waiters.remove(); if(wasInterrupted) // reassert interrupt status on exit current.interrupt(); }

void unlock() { locked.set(false); **LockSupport.unpark** (p. 2027)(waiters.peek()); } };

Since:

1.0

6.409.2 Constructor & Destructor Documentation

6.409.2.1 decaf::util::concurrent::locks::LockSupport::~LockSupport ()

6.409.3 Member Function Documentation

6.409.3.1 static void decaf::util::concurrent::locks::LockSupport::park () throw () [static]

Disables the current thread for thread scheduling purposes unless the permit is available. If the permit is available then it is consumed and the call returns immediately; otherwise the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

* Some other thread invokes unpark with the current thread as the target; or * Some other thread interrupts the current thread; or * The call spuriously (that is, for no reason) returns.

This method does not report which of these caused the method to return. Callers should re-check the conditions which caused the thread to park in the first place. Callers may also determine, for example, the interrupt status of the thread upon return.

6.409.3.2 static void decaf::util::concurrent::locks::LockSupport::parkNanos (long long *nanos*) throw () [static]

Disables the current thread for thread scheduling purposes, for up to the specified waiting time, unless the permit is available. If the permit is available then it is consumed and the call returns immediately; otherwise the current thread becomes disabled for thread scheduling purposes and lies dormant until one of four things happens:

* Some other thread invokes unpark with the current thread as the target; or * Some other thread interrupts the current thread; or * The specified waiting time elapses; or * The call spuriously (that is, for no reason) returns.

This method does not report which of these caused the method to return. Callers should re-check the conditions which caused the thread to park in the first place. Callers may also determine, for example, the interrupt status of the thread, or the elapsed time upon return.

Parameters:

nanos the maximum number of nanoseconds to wait

6.409.3.3 static void decaf::util::concurrent::locks::LockSupport::parkUntil (long long *deadline*) throw () [static]

Disables the current thread for thread scheduling purposes, until the specified deadline, unless the permit is available. If the permit is available then it is consumed and the call returns immediately; otherwise the current thread becomes disabled for thread scheduling purposes and lies dormant until one of four things happens:

∗ Some other thread invokes unpark with the current thread as the target; or ∗ Some other thread interrupts the current thread; or ∗ The specified deadline passes; or ∗ The call spuriously (that is, for no reason) returns.

This method does not report which of these caused the method to return. Callers should re-check the conditions which caused the thread to park in the first place. Callers may also determine, for example, the interrupt status of the thread, or the current time upon return.

Parameters:

deadline the absolute time, in milliseconds from the Epoch, to wait until

6.409.3.4 static void decaf::util::concurrent::locks::LockSupport::unpark (decaf::lang::Thread ∗ *thread*) throw () [static]

Makes available the permit for the given thread, if it was not already available. If the thread was blocked on park then it will unblock. Otherwise, its next call to park is guaranteed not to block. This operation is not guaranteed to have any effect at all if the given thread has not been started.

Parameters:

thread the thread to unport, or NULL in which case the method has no effect.

- virtual void **debug** (const std::string &file, const int line, const std::string functionName, const std::string &message)

  Log a Debug Level Log.

- virtual void **info** (const std::string &file, const int line, const std::string functionName, const std::string &message)

  Log a info Level Log.

- virtual void **warn** (const std::string &file, const int line, const std::string functionName, const std::string &message)

  Log a warn Level Log.

- virtual void **error** (const std::string &file, const int line, const std::string fnctionName, const std::string &message)

  Log a error Level Log.

- virtual void **fatal** (const std::string &file, const int line, const std::string functionName, const std::string &message)

  Log a fatal Level Log.

- virtual bool **isLoggable** (**Level** level) const

  Log a Throw Message.

- virtual void **log** (**LogRecord** &record)

  *Log a **LogRecord** (p. 2050).*

- virtual void **log** (**Level** level, const std::string &message)

  Log a message, with no arguments.

- virtual void **log** (**Level** level, const std::string &file, const int line, const std::string &message,...)

  Log a message, with the list of params that is formatted into the message string.

- virtual void **log** (**Level** level, const std::string &file, const int line, const std::string &message, **lang::Exception** &ex)

  Log a message, with associated Throwable information.

Static Public Member Functions

- static **Logger** * **getAnonymousLogger** ()

  Creates an anonymous logger.

- static **Logger** * **getLogger** (const std::string &name)

  Find or create a logger for a named subsystem.

6.410.1 Constructor & Destructor Documentation

6.410.1.1 decaf::util::logging::Logger::Logger (const std::string & *name*, Logger * *parent*)

Creates a new instance of the **Logger** (p. 2028) with the given name and assign it the given parent logger. The logger will be initially configured with a null Level and with useParentHandlers true.

Parameters:

name - A name for the logger. This should be a dot-separated name and should normally be based on the package name or class name of the subsystem, such as java.net or javax.swing. It may be null for anonymous Loggers.

parent logger that is this one's parent

6.410.1.2 virtual decaf::util::logging::Logger::~Logger () [virtual]

6.410.2 Member Function Documentation

6.410.2.1 virtual void decaf::util::logging::Logger::addHandler (Handler * *handler*) throw (lang::exceptions::IllegalArgumentException) [virtual]

Add a log **Handler** (p. 1709) to receive logging messages. By default, Loggers also send their output to their parent logger. Typically the root **Logger** (p. 2028) is configured with a set of Handlers that essentially act as default handlers for all loggers.

Parameters:

handler A Logging **Handler** (p. 1709)

Exceptions:

IllegalArgumentException

6.410.2.2 virtual void decaf::util::logging::Logger::debug (const std::string & *file*, const int *line*, const std::string *functionName*, const std::string & *message*) [virtual]

Log a Debug Level Log. If the logger is currently enabled for the DEBUG message level then the given message is forwarded to all the registered output **Handler** (p. 1709) objects.

Parameters:

file the file name where the log was generated

line the line number where the log was generated

functionName name of the function that logged this

message the message to log

6.410.2.3 virtual void decaf::util::logging::Logger::entry (const std::string & *blockName*, const std::string & *file*, const int *line*) [virtual]

Logs an Block Enter message. This is a convenience method that is used to tag a block enter, a log record with the class name function name and the string Entering is logged at the DEBUG log level.

Parameters:

blockName source block name

file source file name

line source line name

6.410.2.4 virtual void decaf::util::logging::Logger::error (const std::string & *file*, const int *line*, const std::string *fnctionName*, const std::string & *message*) [virtual]

Log a error Level Log. If the logger is currently enabled for the error message level then the given message is forwarded to all the registered output **Handler** (p. 1709) objects.

Parameters:

file the file name where the log was generated

line the line number where the log was generated

fnctionName name of the function that logged this

message the message to log

6.410.2.5 virtual void decaf::util::logging::Logger::exit (const std::string & *blockName*, const std::string & *file*, const int *line*) [virtual]

Logs an Block Exit message. This is a convenience method that is used to tag a block exit, a log record with the class name function name and the string Exiting is logged at the DEBUG log level.

Parameters:

blockName source block name

file source file name

line source line name

6.410.2.6 virtual void decaf::util::logging::Logger::fatal (const std::string & *file*, const int *line*, const std::string *functionName*, const std::string & *message*) [virtual]

Log a fatal Level Log. If the logger is currently enabled for the fatal message level then the given message is forwarded to all the registered output **Handler** (p. 1709) objects.

Parameters:

file the file name where the log was generated

line the line number where the log was generated

functionName name of the function that logged this

message the message to log

6.410.2.7 static Logger* decaf::util::logging::Logger::getAnonymousLogger () [static]

Creates an anonymous logger. The newly created **Logger** (p. 2028) is not registered in the **LogManager** (p. 2045) namespace. There will be no access checks on updates to the logger. Even although the new logger is anonymous, it is configured to have the root logger ("") as its parent. This means that by default it inherits its effective level and handlers from the root logger.

The caller is responsible for destroying the returned logger.

Returns:

Newly created anonymous logger

6.410.2.8 virtual const Filter* decaf::util::logging::Logger::getFilter () const [inline, virtual]

Gets the **Filter** (p. 1630) object that this class is using.

Returns:

the **Filter** (p. 1630) in use, can be null

6.410.2.9 virtual Level decaf::util::logging::Logger::getLevel () const [inline, virtual]

Get the log Level that has been specified for this **Logger** (p. 2028). The result may be the Null level, which means that this logger's effective level will be inherited from its parent.

Returns:

the level that is currently set

6.410.2.10 static Logger* decaf::util::logging::Logger::getLogger (const std::string & *name*) [static]

Find or create a logger for a named subsystem. If a logger has already been created with the given name it is returned. Otherwise a new logger is created.

If a new logger is created its log level will be configured based on the **LogManager** (p. 2045) and it will configured to also send logging output to its parent loggers Handlers. It will be registered in the **LogManager** (p. 2045) global namespace.

Parameters:

name - A name for the logger. This should be a dot-separated name and should normally be based on the package name or class name of the subsystem, such as cms or **activemq.core.ActiveMQConnection** (p. 233)

Returns:

a suitable logger.

6.410.2.11 virtual const std::string& decaf::util::logging::Logger::getName () const [inline, virtual]

Gets the name of this **Logger** (p. 2028).

Returns:

logger name

6.410.2.12 virtual bool decaf::util::logging::Logger::getUseParentHandlers () const [inline, virtual]

Discover whether or not this logger is sending its output to its parent logger.

Returns:

true if using Parent Handlers

6.410.2.13 virtual void decaf::util::logging::Logger::info (const std::string & *file*, const int *line*, const std::string *functionName*, const std::string & *message*) [virtual]

Log a info Level Log. If the logger is currently enabled for the info message level then the given message is forwarded to all the registered output **Handler** (p. 1709) objects.

Parameters:

file the file name where the log was generated

line the line number where the log was generated

functionName name of the function that logged this

message the message to log

6.410.2.14 virtual bool decaf::util::logging::Logger::isLoggable (Level *level*) const [virtual]

Log a Throw Message. If the logger is currently enabled for the Throwing message level then the given message is forwarded to all the registered output **Handler** (p. 1709) objects.

Parameters:

file the file name where the log was generated

line the line number where the log was generated

functionName name of the function that logged this

message the message to log virtual void throwing(const std::string& file, const int line, const std::string functionName, const std::string& message); Check if a message of the given level would actually be logged by this logger. This check is based on the Loggers effective level, which may be inherited from its parent.

level - a message logging level

Returns:

true if the given message level is currently being logged.

6.410.2.15 virtual void decaf::util::logging::Logger::log (Level *level*, const std::string & *file*, const int *line*, const std::string & *message*, lang::Exception & *ex*) [virtual]

Log a message, with associated Throwable information. If the logger is currently enabled for the given message level then the given arguments are stored in a **LogRecord** (p. 2050) which is

forwarded to all registered output handlers. Note that the thrown argument is stored in the **LogRecord** (p. 2050) thrown property, rather than the **LogRecord** (p. 2050) parameters property. Thus is it processed specially by output Formatters and is not treated as a formatting parameter to the **LogRecord** (p. 2050) message property.

Parameters:

level the Level to log at.

file File that the message was logged in.

line the line number where the message was logged at.

message the message to log.

ex the Exception to log

6.410.2.16 virtual void decaf::util::logging::Logger::log (Level *level*, const std::string & *file*, const int *line*, const std::string & *message*, ...) [virtual]

Log a message, with the list of params that is formatted into the message string. If the logger is currently enabled for the given message level then the given message is forwarded to all the registered output **Handler** (p. 1709) objects

Parameters:

level the Level to log at

file the message to log

line the line in the file

... variable length argument to format the message string.

6.410.2.17 virtual void decaf::util::logging::Logger::log (Level *level*, const std::string & *message*) [virtual]

Log a message, with no arguments. If the logger is currently enabled for the given message level then the given message is forwarded to all the registered output **Handler** (p. 1709) objects

Parameters:

level the Level to log at

message the message to log

6.410.2.18 virtual void decaf::util::logging::Logger::log (LogRecord & *record*) [virtual]

Log a **LogRecord** (p. 2050). All the other logging methods in this class call through this method to actually perform any logging. Subclasses can override this single method to capture all log activity.

Parameters:

record - the **LogRecord** (p. 2050) to be published

6.410.2.19 virtual void decaf::util::logging::Logger::removeHandler (Handler * *handler*) [virtual]

Removes the specified **Handler** (p. 1709) and destroys it. Returns silently if the given **Handler** (p. 1709) is not found.

Parameters:

handler The **Handler** (p. 1709) to remove

6.410.2.20 virtual void decaf::util::logging::Logger::setFilter (Filter * *filter*) [virtual]

Gets a vector containing all the handlers that this class has been assigned to use.

Returns:

a list of handlers that are used by this logger **Set** (p. 2905) a filter to control output on this **Logger** (p. 2028).

After passing the initial "level" check, the **Logger** (p. 2028) will call this **Filter** (p. 1630) to check if a log record should really be published.

The caller releases ownership of this filter to this logger

Parameters:

filter to use, can be null

6.410.2.21 virtual void decaf::util::logging::Logger::setLevel (Level *level*) [inline, virtual]

Set (p. 2905) the log level specifying which message levels will be logged by this logger. Message levels lower than this value will be discarded. The level value Level.OFF can be used to turn off logging.

If the new level is the Null Level, it means that this node should inherit its level from its nearest ancestor with a specific (non-null) level value.

Parameters:

level new Level value

6.410.2.22 virtual void decaf::util::logging::Logger::setUseParentHandlers (bool *value*) [inline, virtual]

pecify whether or not this logger should send its output to it's parent **Logger** (p. 2028). This means that any LogRecords will also be written to the parent's Handlers, and potentially to its parent, recursively up the namespace.

Parameters:

value True is output is to be writen to the parent

6.410.2.23 virtual void decaf::util::logging::Logger::warn (const std::string & *file*, const int *line*, const std::string *functionName*, const std::string & *message*) [virtual]

Log a warn Level Log. If the logger is currently enabled for the warn message level then the given message is forwarded to all the registered output **Handler** (p. 1709) objects.

Parameters:

file the file name where the log was generated

line the line number where the log was generated

functionName name of the function that logged this

message the message to log

`#include <src/main/activemq/io/LoggingInputStream.h>`Inheritance diagram for activemq::io::LoggingInputStream:

Public Member Functions

- **LoggingInputStream** (**decaf::io::InputStream** ∗**inputStream**, bool **own**=false)

  Creates a DataInputStream that uses the specified underlying InputStream.

- virtual ∼**LoggingInputStream** ()
- virtual int **read** () throw (decaf::io::IOException)

  Reads a single byte from the buffer.

- virtual int **read** (unsigned char ∗buffer, std::size_t offset, std::size_t bufferSize) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)

  Reads an array of bytes from the buffer.

6.412.1 Constructor & Destructor Documentation

6.412.1.1 activemq::io::LoggingInputStream::LoggingInputStream (decaf::io::InputStream ∗ *inputStream*, bool *own* = `false`)

Creates a DataInputStream that uses the specified underlying InputStream.

Parameters:

inputStream the InputStream instance to wrap.

own indicates if this class owns the wrapped string defaults to false.

6.412.1.2 virtual activemq::io::LoggingInputStream::∼LoggingInputStream () `[virtual]`

6.412.2 Member Function Documentation

6.412.2.1 virtual int activemq::io::LoggingInputStream::read (unsigned char ∗ *buffer*, std::size_t *offset*, std::size_t *bufferSize*) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException) `[virtual]`

Reads an array of bytes from the buffer. Blocks until the requested number of bytes are available.

Parameters:

buffer (out) the target buffer.

offset the position in the buffer to start at

bufferSize the size of the output buffer.

Returns:

The number of bytes read or -1 if EOF is detected

Exceptions:

IOException thrown if an error occurs.

NullPointerException if buffer is null

Reimplemented from **decaf::io::FilterInputStream** (p. 1635).

6.412.2.2 virtual int activemq::io::LoggingInputStream::read () throw (decaf::io::IOException) [virtual]

Reads a single byte from the buffer. Blocks until data is available.

Returns:

The next byte.

Exceptions:

IOException thrown if an error occurs.

Reimplemented from **decaf::io::FilterInputStream** (p. 1636).

6.413 activemq::io::LoggingOutputStream Class Reference

OutputStream filter that just logs the data being written.

`#include <src/main/activemq/io/LoggingOutputStream.h>`Inheritance diagram for activemq::io::LoggingOutputStream:

Public Member Functions

- **LoggingOutputStream** (OutputStream *next, bool **own**=false)

  Constructor.

- virtual ~**LoggingOutputStream** ()
- virtual void **write** (unsigned char c) throw (decaf::io::IOException)

  Writes a single byte to the output stream.

- virtual void **write** (const unsigned char *buffer, std::size_t offset, std::size_t len) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)

  Writes an array of bytes to the output stream.

6.413.1 Detailed Description

OutputStream filter that just logs the data being written.

6.413.2 Constructor & Destructor Documentation

6.413.2.1 activemq::io::LoggingOutputStream::LoggingOutputStream (OutputStream * *next*, bool *own* = `false`)

Constructor.

Parameters:

next The OutputStream to wrap an write logs to.

own If true, this object will control the lifetime of the output stream that it encapsulates.

6.413.2.2 virtual activemq::io::LoggingOutputStream::~LoggingOutputStream () `[virtual]`

6.413.3 Member Function Documentation

6.413.3.1 virtual void activemq::io::LoggingOutputStream::write (const unsigned char * *buffer*, std::size_t *offset*, std::size_t *len*) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException) `[virtual]`

Writes an array of bytes to the output stream.

Parameters:

buffer The array of bytes to write.

offset the position in the buffer to start at

len The number of bytes from the buffer to be written.

Exceptions:

IOException thrown if an error occurs.

NullPointerException if buffer is null.

Reimplemented from **decaf::io::FilterOutputStream** (p. 1645).

6.413.3.2 virtual void activemq::io::LoggingOutputStream::write (unsigned char *c*) throw (decaf::io::IOException) [virtual]

Writes a single byte to the output stream.

Parameters:

c the byte.

Exceptions:

IOException thrown if an error occurs.

Reimplemented from **decaf::io::FilterOutputStream** (p. 1646).

6.414 activemq::transport::logging::LoggingTransport Class Reference

A transport filter that logs commands as they are sent/received.

`#include <src/main/activemq/transport/logging/LoggingTransport.h>`Inheritance diagram for activemq::transport::logging::LoggingTransport:

Public Member Functions

- **LoggingTransport** (const **Pointer**< **Transport** > &**next**)

  Constructor.

- virtual ~**LoggingTransport** ()
- virtual void **onCommand** (const **Pointer**< **Command** > &command)

  Event handler for the receipt of a command.

- virtual void **oneway** (const **Pointer**< **Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

  Sends a one-way command.

- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

  Not supported by this class - throws an exception.

- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

  Not supported by this class - throws an exception.

6.414.1 Detailed Description

A transport filter that logs commands as they are sent/received.

6.414.2 Constructor & Destructor Documentation

6.414.2.1 activemq::transport::logging::LoggingTransport::LoggingTransport (const Pointer< Transport > & *next*)

Constructor.

Parameters:

next - the next **Transport** (p. 3273) in the chain

6.414.2.2 virtual activemq::transport::logging::LoggingTransport::~LoggingTransport () [inline, virtual]

6.414.3 Member Function Documentation

6.414.3.1 virtual void activemq::transport::logging::LoggingTransport::onCommand (const Pointer< Command > & *command*) [virtual]

Event handler for the receipt of a command.

Parameters:

command - the received command object.

Reimplemented from **activemq::transport::TransportFilter** (p. 3285).

6.414.3.2 virtual void activemq::transport::logging::LoggingTransport::oneway (const Pointer< Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command the command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Reimplemented from **activemq::transport::TransportFilter** (p. 3285).

6.414.3.3 virtual Pointer<Response> activemq::transport::logging::LoggingTransport::request (const Pointer< Command > & *command*, unsigned int *timeout*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Not supported by this class - throws an exception.

Parameters:

command the command that is sent as a request

timeout the time to wait for a response.

Exceptions:

UnsupportedOperationException.

Reimplemented from **activemq::transport::TransportFilter** (p. 3286).

6.414.3.4 virtual Pointer<Response> activemq::transport::logging::LoggingTransport::request (const Pointer< Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Not supported by this class - throws an exception.

Parameters:

command the command that is sent as a request

Exceptions:

UnsupportedOperationException.

Reimplemented from **activemq::transport::TransportFilter** (p. 3287).

  Assignment operator.

6.415.1 Detailed Description

There is a single global **LogManager** (p. 2045) object that is used to maintain a set of shared state about Loggers and log services. This **LogManager** (p. 2045) object:

* Manages a hierarchical namespace of **Logger** (p. 2028) objects. All named Loggers are stored in this namespace. * Manages a set of logging control properties. These are simple key-value pairs that can be used by Handlers and other logging objects to configure themselves.

The global **LogManager** (p. 2045) object can be retrieved using LogManager.getLogManager(). The **LogManager** (p. 2045) object is created during class initialization and cannot subsequently be changed.

TODO* By default, the **LogManager** (p. 2045) reads its initial configuration from a properties file "lib/logging.properties" in the JRE directory. If you edit that property file you can change the default logging configuration for all uses of that JRE.

In addition, the **LogManager** (p. 2045) uses two optional system properties that allow more control over reading the initial configuration:

* "decaf.logger.config.class" * "decaf.logger.config.file"

These two properties may be set via the Preferences API, or as command line property definitions to the "java" command, or as system property definitions passed to JNI_CreateJavaVM.

If the "java.util.logging.config.class" property is set, then the property value is treated as a class name. The given class will be loaded, an object will be instantiated, and that object's constructor is responsible for reading in the initial configuration. (That object may use other system properties to control its configuration.) The alternate configuration class can use readConfiguration(InputStream) to define properties in the **LogManager** (p. 2045).

If "java.util.logging.config.class" property is not set, then the "java.util.logging.config.file" system property can be used to specify a properties file (in java.util.Properties format). The initial logging configuration will be read from this file.

If neither of these properties is defined then, as described above, the **LogManager** (p. 2045) will read its initial configuration from a properties file "lib/logging.properties" in the JRE directory.

The properties for loggers and Handlers will have names starting with the dot-separated name for the handler or logger. ***TODO****

The global logging properties may include:

* A property "handlers". This defines a whitespace separated list of class names for handler classes to load and register as handlers on the root **Logger** (p. 2028) (the **Logger** (p. 2028) named ""). Each class name must be for a **Handler** (p. 1709) class which has a default constructor. Note that these Handlers may be created lazily, when they are first used. * A property "<logger>.handlers".

This defines a whitespace or comma separated list of class names for handlers classes to load and register as handlers to the specified logger. Each class name must be for a **Handler** (p. 1709) class which has a default constructor. Note that these Handlers may be created lazily, when they are first used. * A property "<logger>.useParentHandlers". This defines a boolean value. By default every logger calls its parent in addition to handling the logging message itself, this often result in messages being handled by the root logger as well. When setting this property to false a **Handler** (p. 1709) needs to be configured for this logger otherwise no logging messages are delivered. * A property "config". This property is intended to allow arbitrary configuration code to be run. The property defines a whitespace separated list of class names. A new instance will be created for each named class. The default constructor of each class may execute arbitrary code to update the logging configuration, such as setting logger levels, adding handlers, adding filters, etc.

Loggers are organized into a naming hierarchy based on their dot separated names. Thus "a.b.c" is a child of "a.b", but "a.b1" and a.b2" are peers.

All properties whose names end with ".level" are assumed to define log levels for Loggers. Thus "foo.level" defines a log level for the logger called "foo" and (recursively) for any of its children in the naming hierarchy. Log Levels are applied in the order they are defined in the properties file. Thus level settings for child nodes in the tree should come after settings for their parents. The property name ".level" can be used to set the level for the root of the tree.

All methods on the **LogManager** (p. 2045) object are multi-thread safe.

6.415.2 Constructor & Destructor Documentation

6.415.2.1 virtual decaf::util::logging::LogManager::~LogManager () [virtual]

6.415.2.2 decaf::util::logging::LogManager::LogManager () [inline, protected]

Constructor, hidden to protect against direct instantiation.

6.415.2.3 decaf::util::logging::LogManager::LogManager (const LogManager & *manager*) [protected]

Copy Constructo.

Parameters:

manager the Manager to copy

6.415.3 Member Function Documentation

6.415.3.1 virtual void decaf::util::logging::LogManager::addPropertyChangeListener (PropertyChangeListener * *listener*) [virtual]

Adds a change listener for **LogManager** (p. 2045) **Properties** (p. 2657), adding the same instance of a change event listener does nothing.

Parameters:

listener a PropertyChangeListener

6.415.3.2 static void decaf::util::logging::LogManager::destroy () [static]

Forcefully Delete the Instance of this **LogManager** (p. 2045) even if there are outstanding references.

6.415.3.3 static LogManager* decaf::util::logging::LogManager::getInstance () [static]

Get the singleton instance.

Returns:

Pointer to an instance of the Log Manager

6.415.3.4 virtual Logger* decaf::util::logging::LogManager::getLogger (const std::string & *name*) [virtual]

Retrieves or creates a new **Logger** (p. 2028) using the name specified a new logger inherits the configuration of the logger's parent if there is no configuration data for the logger.

Parameters:

name The name of the **Logger** (p. 2028).

6.415.3.5 virtual int decaf::util::logging::LogManager::getLoggerNames (const std::vector< std::string > & *names*) [virtual]

Gets a list of known **Logger** (p. 2028) Names from this Manager.

Parameters:

names STL Vector to hold string logger names

Returns:

names count of how many loggers were inserted

6.415.3.6 virtual const util::Properties& decaf::util::logging::LogManager::getProperties () const [inline, virtual]

Gets a reference to the Logging **Properties** (p. 2657) used by this logger.

Returns:

The **Logger** (p. 2028) **Properties** (p. 2657) Pointer

6.415.3.7 virtual std::string decaf::util::logging::LogManager::getProperty (const std::string & *name*) [inline, virtual]

Gets the value of a named property of this **LogManager** (p. 2045).

Parameters:

name of the Property to retrieve

Returns:

the value of the property

References decaf::util::Properties::getProperty().

6.415.3.8 void decaf::util::logging::LogManager::operator= (const LogManager & *manager*) [protected]

Assignment operator.

Parameters:

manager the manager to assign from

6.415.3.9 virtual void decaf::util::logging::LogManager::removePropertyChangeListener (PropertyChangeListener * *listener*) [virtual]

Removes a properties change listener from the **LogManager** (p. 2045).

Parameters:

listener a PropertyChangeListener

6.415.3.10 static void decaf::util::logging::LogManager::returnInstance () [static]

Returns a Checked out instance of this Manager.

6.415.3.11 virtual void decaf::util::logging::LogManager::setProperties (const util::Properties & *properties*) [virtual]

Sets the **Properties** (p. 2657) this **LogManager** (p. 2045) should use to configure its loggers. Once set a properties change event is fired.

Parameters:

properties Pointer to read the configuration from

The documentation for this class was generated from the following file:

6.416 decaf::util::logging::LogRecord Class Reference

`#include <src/main/decaf/util/logging/LogRecord.h>`

Public Member Functions

- **LogRecord** ()
- virtual ~**LogRecord** ()
- **Level getLevel** () const

  Get Level of this log record.

- void **setLevel** (**Level** value)

  Set *(p. 2905) the Level of this Log Record.*

- const std::string & **getLoggerName** () const

  Gets the Source Logger's Name.

- void **setLoggerName** (const std::string &loggerName)

  Sets the Source Logger's Name.

- const std::string & **getSourceFile** () const

  Gets the Source Log File name.

- void **setSourceFile** (const std::string &sourceFile)

  Sets the Source Log File Name.

- unsigned long **getSourceLine** () const

  Gets the Source Log line number.

- void **setSourceLine** (long sourceLine)

  Sets the Source Log line number.

- const std::string & **getMessage** () const

  Gets the Message to be Logged.

- void **setMessage** (const std::string &message)

  Sets the Message to be Logged.

- const std::string & **getSourceFunction** () const

  Gets the name of the function where this log was logged.

- void **setSourceFunction** (const std::string &functionName)

  Sets the name of the function where this log was logged.

- unsigned long **getTimestamp** () const

  Gets the time in mills that this message was logged.

- void **setTimestamp** (long timeStamp)

  Sets the time in mills that this message was logged.

- unsigned long **getTreadId** () const
  Gets the Thread Id where this Log was created.
- void **setTreadId** (long threadId)
  Sets the Thread Id where this Log was created.

6.416.1 Constructor & Destructor Documentation

6.416.1.1 decaf::util::logging::LogRecord::LogRecord () [inline]

6.416.1.2 virtual decaf::util::logging::LogRecord::~LogRecord () [inline, virtual]

6.416.2 Member Function Documentation

6.416.2.1 Level decaf::util::logging::LogRecord::getLevel () const [inline]

Get Level of this log record.

Returns:

Level enumeration value.

6.416.2.2 const std::string& decaf::util::logging::LogRecord::getLoggerName () const [inline]

Gets the Source Logger's Name.

Returns:

the source loggers name

6.416.2.3 const std::string& decaf::util::logging::LogRecord::getMessage () const [inline]

Gets the Message to be Logged.

Returns:

the source logger's message

Referenced by decaf::util::logging::SimpleFormatter::formatMessage().

6.416.2.4 const std::string& decaf::util::logging::LogRecord::getSourceFile () const [inline]

Gets the Source Log File name.

Returns:

the source loggers name

6.416.2.5 const std::string& decaf::util::logging::LogRecord::getSourceFunction () const [inline]

Gets the name of the function where this log was logged.

Returns:

the source logger's message

6.416.2.6 unsigned long decaf::util::logging::LogRecord::getSourceLine () const [inline]

Gets the Source Log line number.

Returns:

the source loggers line number

6.416.2.7 unsigned long decaf::util::logging::LogRecord::getTimestamp () const [inline]

Gets the time in mills that this message was logged.

Returns:

UTC time in milliseconds

6.416.2.8 unsigned long decaf::util::logging::LogRecord::getTreadId () const [inline]

Gets the Thread Id where this Log was created.

Returns:

the source loggers line number

6.416.2.9 void decaf::util::logging::LogRecord::setLevel (Level *value*) [inline]

Set (p. 2905) the Level of this Log Record.

Parameters:

value Level Enumeration Value

6.416.2.10 void decaf::util::logging::LogRecord::setLoggerName (const std::string & *loggerName*) [inline]

Sets the Source Logger's Name.

Parameters:

loggerName the source loggers name

6.416.2.11 void decaf::util::logging::LogRecord::setMessage (const std::string & *message*) [inline]

Sets the Message to be Logged.

Parameters:

message the source loggers message

6.416.2.12 void decaf::util::logging::LogRecord::setSourceFile (const std::string & *sourceFile*) [inline]

Sets the Source Log File Name.

Parameters:

sourceFile the source loggers name

6.416.2.13 void decaf::util::logging::LogRecord::setSourceFunction (const std::string & *functionName*) [inline]

Sets the name of the function where this log was logged.

Parameters:

functionName the source of the log

6.416.2.14 void decaf::util::logging::LogRecord::setSourceLine (long *sourceLine*) [inline]

Sets the Source Log line number.

Parameters:

sourceLine the source logger's line number

6.416.2.15 void decaf::util::logging::LogRecord::setTimestamp (long *timeStamp*) [inline]

Sets the time in mills that this message was logged.

Parameters:

timeStamp UTC Time in Milliseconds.

6.416.2.16 void decaf::util::logging::LogRecord::setTreadId (long *threadId*) [inline]

Sets the Thread Id where this Log was created.

Parameters:

threadId the source logger's line number

6.417 decaf::util::logging::LogWriter Class Reference

`#include <src/main/decaf/util/logging/LogWriter.h>`

Public Member Functions

- **LogWriter** ()
- virtual ~**LogWriter** ()
- virtual void **log** (const std::string &file, const int line, const std::string &prefix, const std::string &message)

  Writes a message to the output destination.

- virtual void **log** (const std::string &message)

  Writes a message to the output destination.

Static Public Member Functions

- static **LogWriter** & **getInstance** ()

  Get the singleton instance.

- static void **returnInstance** ()

  Returns a Checked out instance of this Writer.

- static void **destroy** ()

  *Forcefully Delete the Instance of this **LogWriter** (p. 2055) even if there are outstanding references.*

6.417.1 Constructor & Destructor Documentation

6.417.1.1 decaf::util::logging::LogWriter::LogWriter ()

6.417.1.2 virtual decaf::util::logging::LogWriter::~LogWriter () [virtual]

6.417.2 Member Function Documentation

6.417.2.1 static void decaf::util::logging::LogWriter::destroy () [static]

Forcefully Delete the Instance of this **LogWriter** (p. 2055) even if there are outstanding references.

6.417.2.2 static LogWriter& decaf::util::logging::LogWriter::getInstance () [static]

Get the singleton instance.

6.417.2.3 virtual void decaf::util::logging::LogWriter::log (const std::string & *message*) [virtual]

Writes a message to the output destination.

Parameters:

message

6.417.2.4 virtual void decaf::util::logging::LogWriter::log (const std::string & *file*, const int *line*, const std::string & *prefix*, const std::string & *message*) [virtual]

Writes a message to the output destination.

Parameters:

file

line

prefix

message

6.417.2.5 static void decaf::util::logging::LogWriter::returnInstance () [static]

Returns a Checked out instance of this Writer.

6.418 decaf::lang::Long Class Reference

`#include <src/main/decaf/lang/Long.h>`Inheritance diagram for decaf::lang::Long:

Public Member Functions

- **Long** (long long value)
- **Long** (const std::string &value) throw (exceptions::NumberFormatException)
- virtual ~**Long** ()
- virtual int **compareTo** (const **Long** &l) const

  *Compares this **Long** (p. 2057) instance with another.*

- bool **equals** (const **Long** &l) const
- virtual bool **operator==** (const **Long** &l) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const **Long** &l) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- virtual int **compareTo** (const long long &l) const

  *Compares this **Long** (p. 2057) instance with another.*

- bool **equals** (const long long &l) const
- virtual bool **operator==** (const long long &l) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const long long &l) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- std::string **toString** () const
- virtual double **doubleValue** () const

  Answers the double value which the receiver represents.

- virtual float **floatValue** () const

  Answers the float value which the receiver represents.

- virtual unsigned char **byteValue** () const

  Answers the byte value which the receiver represents.

- virtual short **shortValue** () const

  Answers the short value which the receiver represents.

- virtual int **intValue** () const

  Answers the int value which the receiver represents.

- virtual long long **longValue** () const

  Answers the long value which the receiver represents.

Static Public Member Functions

- static int **bitCount** (long long value)

  Returns the number of one-bits in the two's complement binary representation of the specified int value.

- static **Long decode** (const std::string &value) throw (exceptions::NumberFormatException)

  *Decodes a String into a **Long** (p. 2057).*

- static long long **highestOneBit** (long long value)

  Returns an long long value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value.

- static long long **lowestOneBit** (long long value)

  Returns an long long value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value.

- static int **numberOfLeadingZeros** (long long value)

  Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified long long value.

- static int **numberOfTrailingZeros** (long long value)

  Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified long long value.

- static long long **parseLong** (const std::string &value) throw (exceptions::NumberFormatException)

  Parses the string argument as a signed decimal long.

- static long long **parseLong** (const std::string &value, int radix) throw (exceptions::NumberFormatException)

  *Returns a **Long** (p. 2057) object holding the value extracted from the specified string when parsed with the radix given by the second argument.*

- static long long **reverseBytes** (long long value)

  Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified long long value.

- static long long **reverse** (long long value)

  Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified long long value.

- static long long **rotateLeft** (long long value, int distance)

  Returns the value obtained by rotating the two's complement binary representation of the specified value left by the specified number of bits.

- static long long **rotateRight** (long long value, int distance)

  Returns the value obtained by rotating the two's complement binary representation of the specified value right by the specified number of bits.

- static int **signum** (long long value)

Returns the signum function of the specified value.

- static std::string **toString** (long long value)

  Converts the long to a String representation.

- static std::string **toString** (long long value, int radix)
- static std::string **toHexString** (long long value)

  Returns a string representation of the integer argument as an unsigned integer in base 16.

- static std::string **toOctalString** (long long value)

  Returns a string representation of the long long argument as an unsigned long long in base 8.

- static std::string **toBinaryString** (long long value)

  Returns a string representation of the long long argument as an unsigned long long in base 2.

- static **Long valueOf** (long long value)

  *Returns a **Long** (p. 2057) instance representing the specified int value.*

- static **Long valueOf** (const std::string &value) throw (exceptions::NumberFormatException)

  *Returns a **Long** (p. 2057) object holding the value given by the specified std::string.*

- static **Long valueOf** (const std::string &value, int radix) throw (exceptions::NumberFormatException)

  *Returns a **Long** (p. 2057) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*

Static Public Attributes

- static const int **SIZE** = 64

  The size in bits of the primitive long long type.

- static const long long **MAX_VALUE** = (long long)0x7FFFFFFFFFFFFFFFLL

  The maximum value that the primitive type can hold.

- static const long long **MIN_VALUE** = (long long)0x8000000000000000LL

  The minimum value that the primitive type can hold.

6.418.1 Constructor & Destructor Documentation

6.418.1.1 decaf::lang::Long::Long (long long *value*)

Parameters:

value - the primitive long long to wrap

6.418.1.2 decaf::lang::Long::Long (const std::string & *value*) throw (exceptions::NumberFormatException)

Parameters:

value - the long long formated string to wrap

Exceptions:

NumberFormatException

6.418.1.3 virtual decaf::lang::Long::~Long () [inline, virtual]

6.418.2 Member Function Documentation

6.418.2.1 static int decaf::lang::Long::bitCount (long long *value*) [static]

Returns the number of one-bits in the two's complement binary representation of the specified int value. This function is sometimes referred to as the population count.

Parameters:

value - the long long to count

Returns:

the number of one-bits in the two's complement binary representation of the specified long long value.

6.418.2.2 virtual unsigned char decaf::lang::Long::byteValue () const [inline, virtual]

Answers the byte value which the receiver represents.

Returns:

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2432).

6.418.2.3 virtual int decaf::lang::Long::compareTo (const long long & *l*) const [virtual]

Compares this **Long** (p. 2057) instance with another.

Parameters:

l - the **Integer** (p. 1762) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object repesents a value less than the passed in value.

Implements **decaf::lang::Comparable< long long >** (p. 1083).

6.418.2.4 virtual int decaf::lang::Long::compareTo (const Long & *l*) const [virtual]

Compares this **Long** (p. 2057) instance with another.

Parameters:

l - the **Long** (p. 2057) instance to be compared

Returns:

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object repesents a value less than the passed in value.

Implements **decaf::lang::Comparable< Long >** (p. 1083).

6.418.2.5 static Long decaf::lang::Long::decode (const std::string & *value*) throw (exceptions::NumberFormatException) [static]

Decodes a String into a **Long** (p. 2057). Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the Integer.parseInteger method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a NumberFormatException will be thrown. The result is negated if first character of the specified String is the minus sign. No whitespace characters are permitted in the string.

Parameters:

value - The string to decode

Returns:

a **Long** (p. 2057) object containing the decoded value

Exceptions:

NumberFomatException if the string is not formatted correctly.

6.418.2.6 virtual double decaf::lang::Long::doubleValue () const [inline, virtual]

Answers the double value which the receiver represents.

Returns:

double the value of the receiver.

Implements **decaf::lang::Number** (p. 2433).

6.418.2.7 bool decaf::lang::Long::equals (const long long & *l*) const [inline, virtual]

Parameters:

l - the **Long** (p. 2057) object to compare against.

Returns:

true if the two **Integer** (p. 1762) Objects have the same value.

Implements **decaf::lang::Comparable< long long >** (p. 1084).

6.418.2.8 bool decaf::lang::Long::equals (const Long & *l*) const [inline, virtual]

Parameters:

l - the **Long** (p. 2057) object to compare against.

Returns:

true if the two **Integer** (p. 1762) Objects have the same value.

Implements **decaf::lang::Comparable< Long >** (p. 1084).

6.418.2.9 virtual float decaf::lang::Long::floatValue () const [inline, virtual]

Answers the float value which the receiver represents.

Returns:

float the value of the receiver.

Implements **decaf::lang::Number** (p. 2433).

6.418.2.10 static long long decaf::lang::Long::highestOneBit (long long *value*) [static]

Returns an long long value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value. Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters:

value - the long long to be inspected

Returns:

an long long value with a single one-bit, in the position of the highest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.418.2.11 virtual int decaf::lang::Long::intValue () const [inline, virtual]

Answers the int value which the receiver represents.

Returns:

int the value of the receiver.

Implements **decaf::lang::Number** (p. 2433).

6.418.2.12 virtual long long decaf::lang::Long::longValue () const [inline, virtual]

Answers the long value which the receiver represents.

Returns:

long the value of the receiver.

Implements **decaf::lang::Number** (p. 2433).

6.418.2.13 static long long decaf::lang::Long::lowestOneBit (long long *value*) [static]

Returns an long long value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value. Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters:

value - the long long to be inspected

Returns:

an long long value with a single one-bit, in the position of the lowest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.418.2.14 static int decaf::lang::Long::numberOfLeadingZeros (long long *value*) [static]

Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified long long value. Returns 64 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Note that this method is closely related to the logarithm base 2. For all positive int values x:

∗ floor(log2(x)) = 63 - numberOfLeadingZeros(x) ∗ ceil(log2(x)) = 64 - numberOfLeadingZeros(x - 1)

Parameters:

value - the long long to be inspected

Returns:

the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified long long value, or 64 if the value is equal to zero.

6.418.2.15 static int decaf::lang::Long::numberOfTrailingZeros (long long *value*) [static]

Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified long long value. Returns 64 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Parameters:

value - the int to be inspected

Returns:

the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified long long value, or 64 if the value is equal to zero.

6.418.2.16 virtual bool decaf::lang::Long::operator< (const long long & *l*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

l - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< long long >** (p. 1084).

6.418.2.17 virtual bool decaf::lang::Long::operator< (const Long & *l*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

l - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Long >** (p. 1084).

6.418.2.18 virtual bool decaf::lang::Long::operator== (const long long & *l*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

l - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< long long >** (p. 1085).

6.418.2.19 virtual bool decaf::lang::Long::operator== (const Long & *l*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters:

l - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Long >** (p. 1085).

6.418.2.20 static long long decaf::lang::Long::parseLong (const std::string & *value*, int *radix*) throw (exceptions::NumberFormatException) [static]

Returns a **Long** (p. 2057) object holding the value extracted from the specified string when parsed with the radix given by the second argument. The first argument is interpreted as representing a signed long in the radix specified by the second argument, exactly as if the arguments were given to the parseLong(std::string, int) method. The result is a **Long** (p. 2057) object that represents the long long value specified by the string.

Parameters:

value - String to parse

radix - the base encoding of the string

Returns:

long long value

Exceptions:

NumberFormatException on invalid string value

6.418.2.21 static long long decaf::lang::Long::parseLong (const std::string & *value*) throw (exceptions::NumberFormatException) [static]

Parses the string argument as a signed decimal long. The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting long value is returned, exactly as if the argument and the radix 10 were given as arguments to the parseLong(java.lang.String, int) method.

Note that the characters LL or ULL are not permitted to appear at the end of this string as would normally be permitted in a C++ program.

Parameters:

value - String to parse

Returns:

long long value

Exceptions:

NumberFormatException on invalid string value

6.418.2.22 static long long decaf::lang::Long::reverse (long long *value*) [static]

Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified long long value.

Parameters:

value - the value whose bits are to be reversed

Returns:

the reversed bits long long.

6.418.2.23 static long long decaf::lang::Long::reverseBytes (long long *value*) [static]

Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified long long value.

Parameters:

value - the long long whose bytes we are to reverse

Returns:

the reversed long long.

6.418.2.24 static long long decaf::lang::Long::rotateLeft (long long *value*, int *distance*) [static]

Returns the value obtained by rotating the two's complement binary representation of the specified value left by the specified number of bits. (Bits shifted out of the left hand, or high-order, side reenter on the right, or low-order.)

Note that left rotation with a negative distance is equivalent to right rotation: rotateLeft(val, -distance) == rotateRight(val, distance). Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation distance can be ignored, even if the distance is negative: rotateLeft(val, distance) == rotateLeft(val, distance & 0x1F).

Parameters:

value - the long long to be inspected

distance - the number of bits to rotate

Returns:

the value obtained by rotating the two's complement binary representation of the specified value left by the specified number of bits.

6.418.2.25 static long long decaf::lang::Long::rotateRight (long long *value*, int *distance*) [static]

Returns the value obtained by rotating the two's complement binary representation of the specified value right by the specified number of bits. (Bits shifted out of the right hand, or low-order, side reenter on the left, or high-order.)

Note that right rotation with a negative distance is equivalent to left rotation: rotateRight(val, -distance) == rotateLeft(val, distance). Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation distance can be ignored, even if the distance is negative: rotateRight(val, distance) == rotateRight(val, distance & 0x1F).

Parameters:

value - the long long to be inspected

distance - the number of bits to rotate

Returns:

the value obtained by rotating the two's complement binary representation of the specified value right by the specified number of bits.

6.418.2.26 virtual short decaf::lang::Long::shortValue () const [inline, virtual]

Answers the short value which the receiver represents.

Returns:

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 2434).

6.418.2.27 static int decaf::lang::Long::signum (long long *value*) [static]

Returns the signum function of the specified value. (The return value is -1 if the specified value is negative; 0 if the specified value is zero; and 1 if the specified value is positive.)

Parameters:

value - the long long to be inspected

Returns:

the signum function of the specified long long value.

6.418.2.28 static std::string decaf::lang::Long::toBinaryString (long long *value*) [static]

Returns a string representation of the long long argument as an unsigned long long in base 2. The unsigned long long value is the argument plus 2^32 if the argument is negative; otherwise it is equal to the argument. This value is converted to a string of ASCII digits in binary (base 2) with no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The characters '0' and '1' are used as binary digits.

Parameters:

value - the long long to be translated to a binary string

Returns:

the unsigned long long value as a binary string

6.418.2.29 static std::string decaf::lang::Long::toHexString (long long *value*) [static]

Returns a string representation of the integer argument as an unsigned integer in base 16. The unsigned integer value is the argument plus 2^32 if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in hexadecimal (base 16) with no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as hexadecimal digits:

0123456789abcdef

If uppercase letters are desired, the toUpperCase() method may be called on the result:

Parameters:

value - the long long to be translated to an Octal string

Returns:

the unsigned long long value as a Octal string

6.418.2.30 static std::string decaf::lang::Long::toOctalString (long long *value*) [static]

Returns a string representation of the long long argument as an unsigned long long in base 8. The unsigned long long value is the argument plus 2^32 if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in octal (base 8) with no extra leading 0s.

If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as octal digits:

01234567

Parameters:

value - the long long to be translated to an Octal string

Returns:

the unsigned long long value as a Octal string

6.418.2.31 static std::string decaf::lang::Long::toString (long long *value*, int *radix*) [static]

6.418.2.32 static std::string decaf::lang::Long::toString (long long *value*) [static]

Converts the long to a String representation.

Parameters:

value The long to convert to a std::string.

Returns:

string representation

6.418.2.33 std::string decaf::lang::Long::toString () const

Returns:

this **Long** (p. 2057) Object as a String Representation

6.418.2.34 static Long decaf::lang::Long::valueOf (const std::string & *value*, int *radix*) throw (exceptions::NumberFormatException) [static]

Returns a **Long** (p. 2057) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument. The first argument is interpreted as representing a signed long long in the radix specified by the second argument, exactly as if the argument were given to the parseLong(std::string, int) method. The result is a **Long** (p. 2057) object that represents the long long value specified by the string.

Parameters:

value - std::string to parse as base (radix)

radix - base of the string to parse.

Returns:

new **Long** (p. 2057) Object wrapping the primitive

Exceptions:

NumberFormatException if the string is not a valid long long.

6.418.2.35 static Long decaf::lang::Long::valueOf (const std::string & *value*) throw (exceptions::NumberFormatException) [static]

Returns a **Long** (p. 2057) object holding the value given by the specified std::string. The argument is interpreted as representing a signed decimal long long, exactly as if the argument were given to the parseLong(std::string) method. The result is a **Integer** (p. 1762) object that represents the long long value specified by the string.

Parameters:

value - std::string to parse as base 10

Returns:

new **Long** (p. 2057) Object wrapping the primitive

Exceptions:

NumberFormatException if the string is not a decimal long long.

6.418.2.36 static Long decaf::lang::Long::valueOf (long long *value*) [inline, static]

Returns a **Long** (p. 2057) instance representing the specified int value.

Parameters:

value - the long long to wrap

Returns:

the new **Integer** (p. 1762) object wrapping value.

6.418.3 Field Documentation

6.418.3.1 const long long decaf::lang::Long::MAX_VALUE = (long long)0x7FFFFFFFFFFFFFFFLL [static]

The maximum value that the primitive type can hold.

6.418.3.2 const long long decaf::lang::Long::MIN_VALUE = (long long)0x8000000000000000LL [static]

The minimum value that the primitive type can hold.

6.418.3.3 const int decaf::lang::Long::SIZE = 64 [static]

The size in bits of the primitive long long type.

The documentation for this class was generated from the following file:

6.419 decaf::internal::nio::LongArrayBuffer Class Reference

`#include <src/main/decaf/internal/nio/LongArrayBuffer.h>`Inheritance diagram for decaf::internal::nio::LongArrayBuffer:

Public Member Functions

- **LongArrayBuffer** (std::size_t capacity, bool readOnly=false)

  *Creates a **IntArrayBuffer** (p. 1744) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

- **LongArrayBuffer** (long long *array, std::size_t offset, std::size_t capacity, bool readOnly=false) throw (decaf::lang::exceptions::NullPointerException)

  *Creates a **LongArrayBuffer** (p. 2071) object that wraps the given array.*

- **LongArrayBuffer** (**ByteArrayPerspective** &array, std::size_t offset, std::size_t capacity, bool readOnly=false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

  *Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 908) and start at the given offset.*

- **LongArrayBuffer** (const **LongArrayBuffer** &other)

  *Create a **LongArrayBuffer** (p. 2071) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 908) and when changes are made to that data it is reflected in both.*

- virtual ~**LongArrayBuffer** ()
- virtual long long * **array** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)

  Returns the long long array that backs this buffer (optional operation).

- virtual std::size_t **arrayOffset** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

- virtual LongBuffer * **asReadOnlyBuffer** () const

  Creates a new, read-only long long buffer that shares this buffer's content.

- virtual LongBuffer & **compact** () throw (decaf::nio::ReadOnlyBufferException)

  Compacts this buffer.

- virtual LongBuffer * **duplicate** ()

  Creates a new long long buffer that shares this buffer's content.

- virtual long long **get** () throw (decaf::nio::BufferUnderflowException)

  Relative get method.

- virtual long long **get** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)

Absolute get method.

- virtual bool **hasArray** () const

  Tells whether or not this buffer is backed by an accessible long long array.

- virtual bool **isReadOnly** () const

  Tells whether or not this buffer is read-only.

- virtual LongBuffer & **put** (long long value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)

  Writes the given doubles into this buffer at the current position, and then increments the position.

- virtual LongBuffer & **put** (std::size_t index, long long value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)

  Writes the given doubles into this buffer at the given index.

- virtual LongBuffer * **slice** () const

  Creates a new LongBuffer whose content is a shared subsequence of this buffer's content.

Protected Member Functions

- virtual void **setReadOnly** (bool value)

  *Sets this **ByteArrayBuffer** (p. 870) as Read-Only.*

6.419.1 Constructor & Destructor Documentation

6.419.1.1 decaf::internal::nio::LongArrayBuffer::LongArrayBuffer (std::size_t *capacity*, bool *readOnly* = `false`)

Creates a **IntArrayBuffer** (p. 1744) object that has its backing array allocated internally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

6.419.1.2 decaf::internal::nio::LongArrayBuffer::LongArrayBuffer (long long * *array*, std::size_t *offset*, std::size_t *capacity*, bool *readOnly* = `false`) throw (decaf::lang::exceptions::NullPointerException)

Creates a **LongArrayBuffer** (p. 2071) object that wraps the given array. If the own flag is set then it will delete this array when this object is deleted.

Parameters:

array - array to wrap

offset - the position that is this buffers start pos.

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

Exceptions:

NullPointerException if buffer is NULL

6.419.1.3 decaf::internal::nio::LongArrayBuffer::LongArrayBuffer (ByteArrayPerspective & *array*, std::size_t *offset*, std::size_t *capacity*, bool *readOnly* = `false`) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 908) and start at the given offset. The capacity and limit of the new **LongArrayBuffer** (p. 2071) will be that of the remaining capacity of the passed buffer.

Parameters:

array - the **ByteArrayPerspective** (p. 908) to wrap

offset - the offset into array where the buffer starts

capacity - the length of the array we are wrapping or limit.

readOnly - is this a readOnly buffer.

Exceptions:

IndexOutOfBoundsException if offset is greater than array capacity.

6.419.1.4 decaf::internal::nio::LongArrayBuffer::LongArrayBuffer (const LongArrayBuffer & *other*)

Create a **LongArrayBuffer** (p. 2071) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 908) and when changes are made to that data it is reflected in both.

Parameters:

other - the **LongArrayBuffer** (p. 2071) this one is to mirror.

6.419.1.5 virtual decaf::internal::nio::LongArrayBuffer::~LongArrayBuffer () `[virtual]`

6.419.2 Member Function Documentation

6.419.2.1 virtual long long* decaf::internal::nio::LongArrayBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) `[virtual]`

Returns the long long array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this Buffer

Exceptions:

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::LongBuffer** (p. 2082).

6.419.2.2 virtual std::size_t decaf::internal::nio::LongArrayBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset into the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::LongBuffer** (p. 2082).

6.419.2.3 virtual LongBuffer* decaf::internal::nio::LongArrayBuffer::asReadOnlyBuffer () const [virtual]

Creates a new, read-only long long buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only long long buffer which the caller then owns.

Implements **decaf::nio::LongBuffer** (p. 2082).

6.419.2.4 virtual LongBuffer& decaf::internal::nio::LongArrayBuffer::compact () throw (decaf::nio::ReadOnlyBufferException) [virtual]

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 807) is copied

to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 807) - 1 is copied to index n = **limit()** (p. 807) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this LongBuffer

Exceptions:

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::LongBuffer** (p. 2083).

6.419.2.5 virtual LongBuffer* decaf::internal::nio::LongArrayBuffer::duplicate () [virtual]

Creates a new long long buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new long long Buffer which the caller owns.

Implements **decaf::nio::LongBuffer** (p. 2083).

6.419.2.6 virtual long long decaf::internal::nio::LongArrayBuffer::get (std::size_t *index*) const throw (lang::exceptions::IndexOutOfBoundsException) [virtual]

Absolute get method. Reads the value at the given index.

Parameters:

index - the index in the Buffer where the long long is to be read

Returns:

the long long that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implements **decaf::nio::LongBuffer** (p. 2085).

6.419.2.7 virtual long long decaf::internal::nio::LongArrayBuffer::get () throw (decaf::nio::BufferUnderflowException) [virtual]

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the long long at the current position

Exceptions:

BufferUnderflowException if there no more data to return

Implements **decaf::nio::LongBuffer** (p. 2085).

6.419.2.8 virtual bool decaf::internal::nio::LongArrayBuffer::hasArray () const [inline, virtual]

Tells whether or not this buffer is backed by an accessible long long array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implements **decaf::nio::LongBuffer** (p. 2085).

6.419.2.9 virtual bool decaf::internal::nio::LongArrayBuffer::isReadOnly () const [inline, virtual]

Tells whether or not this buffer is read-only.

Returns:

true if, and only if, this buffer is read-only

Implements **decaf::nio::Buffer** (p. 806).

6.419.2.10 virtual LongBuffer& decaf::internal::nio::LongArrayBuffer::put (std::size_t *index*, long long *value*) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException) [virtual]

Writes the given doubles into this buffer at the given index.

Parameters:

index - position in the Buffer to write the data

value - the doubles to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::LongBuffer** (p. 2086).

6.419.2.11 virtual LongBuffer& decaf::internal::nio::LongArrayBuffer::put (long long *value*) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException) [virtual]

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters:

value - the doubles value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::LongBuffer** (p. 2086).

6.419.2.12 virtual void decaf::internal::nio::LongArrayBuffer::setReadOnly (bool *value*) [inline, protected, virtual]

Sets this **ByteArrayBuffer** (p. 870) as Read-Only.

Parameters:

value - true if this buffer is to be read-only.

6.419.2.13 virtual LongBuffer* decaf::internal::nio::LongArrayBuffer::slice () const [virtual]

Creates a new LongBuffer whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create LongBuffer which the caller owns.

Implements **decaf::nio::LongBuffer** (p. 2088).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/nio/**LongArrayBuffer.h**

6.420 decaf::nio::LongBuffer Class Reference

This class defines four categories of operations upon long long buffers:.

`#include <src/main/decaf/nio/LongBuffer.h>`Inheritance diagram for decaf::nio::LongBuffer:

Public Member Functions

- virtual ~**LongBuffer** ()
- virtual std::string **toString** () const
- virtual long long * **array** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)

  Returns the long long array that backs this buffer (optional operation).

- virtual std::size_t **arrayOffset** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

- virtual **LongBuffer** * **asReadOnlyBuffer** () const =0

  Creates a new, read-only long long buffer that shares this buffer's content.

- virtual **LongBuffer** & **compact** ()=0 throw (ReadOnlyBufferException)

  Compacts this buffer.

- virtual **LongBuffer** * **duplicate** ()=0

  Creates a new long long buffer that shares this buffer's content.

- virtual long long **get** ()=0 throw (BufferUnderflowException)

  Relative get method.

- virtual long long **get** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)

  Absolute get method.

- **LongBuffer** & **get** (std::vector< long long > buffer) throw (BufferUnderflowException)

  Relative bulk get method.

- **LongBuffer** & **get** (long long *buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)

  Relative bulk get method.

- virtual bool **hasArray** () const =0

  Tells whether or not this buffer is backed by an accessible long long array.

- **LongBuffer** & **put** (**LongBuffer** &src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)

  This method transfers the long longs remaining in the given source buffer long longo this buffer.

- **LongBuffer** & **put** (const long long *buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)

  This method transfers long longs long longo this buffer from the given source array.

- **LongBuffer** & **put** (std::vector< long long > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)

  This method transfers the entire content of the given source long longs array long longo this buffer.

- virtual **LongBuffer** & **put** (long long value)=0 throw (BufferOverflowException, ReadOnlyBufferException)

  Writes the given long longs long longo this buffer at the current position, and then increments the position.

- virtual **LongBuffer** & **put** (std::size_t index, long long value)=0 throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)

  Writes the given long longs long longo this buffer at the given index.

- virtual **LongBuffer** * **slice** () const =0

  *Creates a new **LongBuffer** (p. 2079) whose content is a shared subsequence of this buffer's content.*

- virtual int **compareTo** (const **LongBuffer** &value) const

  Compares this object with the specified object for order.

- virtual bool **equals** (const **LongBuffer** &value) const
- virtual bool **operator==** (const **LongBuffer** &value) const

  Compares equality between this object and the one passed.

- virtual bool **operator<** (const **LongBuffer** &value) const

  Compares this object to another and returns true if this object is considered to be less than the one passed.

Static Public Member Functions

- static **LongBuffer** * **allocate** (std::size_t capacity)

  Allocates a new Double buffer.

- static **LongBuffer** * **wrap** (long long *array, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)

  *Wraps the passed buffer with a new **LongBuffer** (p. 2079).*

- static **LongBuffer** * **wrap** (std::vector< long long > &buffer)

  *Wraps the passed STL long long Vector in a **LongBuffer** (p. 2079).*

Protected Member Functions

- **LongBuffer** (std::size_t capacity)

  *Creates a **LongBuffer** (p. 2079) object that has its backing array allocated long longernally and is then owned and deleted when this object is deleted.*

6.420.1 Detailed Description

This class defines four categories of operations upon long long buffers:. o Absolute and relative get and put methods that read and write single long longs; o Relative bulk get methods that transfer contiguous sequences of long longs from this buffer long longo an array; and o Relative bulk put methods that transfer contiguous sequences of long longs from a long long array or some other long long buffer long longo this buffer o Methods for compacting, duplicating, and slicing a long long buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing long long array long longo a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.420.2 Constructor & Destructor Documentation

6.420.2.1 decaf::nio::LongBuffer::LongBuffer (std::size_t *capacity*) [protected]

Creates a **LongBuffer** (p. 2079) object that has its backing array allocated long longernally and is then owned and deleted when this object is deleted. The array is initially created with all elements initialized to zero.

Parameters:

capacity - size and limit of the **Buffer** (p. 803) in doubles

6.420.2.2 virtual decaf::nio::LongBuffer::~LongBuffer () [inline, virtual]

6.420.3 Member Function Documentation

6.420.3.1 static LongBuffer* decaf::nio::LongBuffer::allocate (std::size_t *capacity*) [static]

Allocates a new Double buffer. The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters:

capacity - The size of the Double buffer in long longs

Returns:

the **LongBuffer** (p. 2079) that was allocated, caller owns.

6.420.3.2 virtual long long* decaf::nio::LongBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]

Returns the long long array that backs this buffer (optional operation). Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

the array that backs this **Buffer** (p. 803)

Exceptions:

ReadOnlyBufferException *(p. 2685)* if this **Buffer** (p. 803) is read only.
UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 2073).

6.420.3.3 virtual std::size_t decaf::nio::LongBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation). Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns:

The offset long longo the backing array where index zero starts.

Exceptions:

ReadOnlyBufferException *(p. 2685)* if this **Buffer** (p. 803) is read only.
UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 2074).

6.420.3.4 virtual LongBuffer* decaf::nio::LongBuffer::asReadOnlyBuffer () const [pure virtual]

Creates a new, read-only long long buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns:

The new, read-only long long buffer which the caller then owns.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 2074).

6.420.3.5 virtual LongBuffer& decaf::nio::LongBuffer::compact () throw (ReadOnlyBufferException) [pure virtual]

Compacts this buffer. The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 807) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 807) - 1 is copied to index n = **limit()** (p. 807) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns:

a reference to this **LongBuffer** (p. 2079)

Exceptions:

ReadOnlyBufferException *(p. **2685**)* - If this buffer is read-only

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 2074).

6.420.3.6 virtual int decaf::nio::LongBuffer::compareTo (const LongBuffer & *value*) const [virtual]

Compares this object with the specified object for order. Returns a negative long longeger, zero, or a positive long longeger as this object is less than, equal to, or greater than the specified object.

Parameters:

value - the Object to be compared.

Returns:

a negative long longeger, zero, or a positive long longeger as this object is less than, equal to, or greater than the specified object.

6.420.3.7 virtual LongBuffer* decaf::nio::LongBuffer::duplicate () [pure virtual]

Creates a new long long buffer that shares this buffer's content. The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

a new long long **Buffer** (p. 803) which the caller owns.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 2075).

6.420.3.8 virtual bool decaf::nio::LongBuffer::equals (const LongBuffer & *value*) const [virtual]

Returns:

true if this value is considered equal to the passed value.

6.420.3.9 LongBuffer& decaf::nio::LongBuffer::get (long long * *buffer*, std::size_t *offset*, std::size_t *length*) throw (BufferUnderflowException, lang::exceptions::NullPointerException)

Relative bulk get method. This method transfers long longs from this buffer long longo the given destination array. If there are fewer long longs remaining in the buffer than are required to satisfy the request, that is, if length > **remaining()** (p. 808), then no bytes are transferred and a **BufferUnderflowException** (p. 837) is thrown.

Otherwise, this method copies length long longs from this buffer long longo the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters:

buffer - long longer to an allocated buffer to fill

offset - position in the buffer to start filling

length - amount of data to put in the passed buffer

Returns:

a reference to this **Buffer** (p. 803)

Exceptions:

BufferUnderflowException *(*p. ***837)*** - If there are fewer than length long longs remaining in this buffer

NullPolong longerException if the passed buffer is null.

6.420.3.10 LongBuffer& decaf::nio::LongBuffer::get (std::vector< long long > *buffer*) throw (BufferUnderflowException)

Relative bulk get method. This method transfers values from this buffer long longo the given destination vector. An invocation of this method of the form src.get(a) behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call buffer.resize(N) before calling this get method.

Returns:

a reference to this **Buffer** (p. 803)

Exceptions:

BufferUnderflowException *(*p. ***837)*** - If there are fewer than length long longs remaining in this buffer

6.420.3.11 virtual long long decaf::nio::LongBuffer::get (std::size_t *index*) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Absolute get method. Reads the value at the given index.

Parameters:

index - the index in the **Buffer** (p. 803) where the long long is to be read

Returns:

the long long that is located at the given index

Exceptions:

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 2075).

6.420.3.12 virtual long long decaf::nio::LongBuffer::get () throw (BufferUnderflowException) [pure virtual]

Relative get method. Reads the value at this buffer's current position, and then increments the position.

Returns:

the long long at the current position

Exceptions:

BufferUnderflowException *(p. 837)* if there no more data to return

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 2076).

6.420.3.13 virtual bool decaf::nio::LongBuffer::hasArray () const [pure virtual]

Tells whether or not this buffer is backed by an accessible long long array. If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns:

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 2076).

6.420.3.14 virtual bool decaf::nio::LongBuffer::operator< (const LongBuffer & *value*) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed. This

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.420.3.15 virtual bool decaf::nio::LongBuffer::operator== (const LongBuffer & *value*) const [virtual]

Compares equality between this object and the one passed.

Parameters:

value - the value to be compared to this one.

Returns:

true if this object is equal to the one passed.

6.420.3.16 virtual LongBuffer& decaf::nio::LongBuffer::put (std::size_t *index*, long long *value*) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException) [pure virtual]

Writes the given long longs long longo this buffer at the given index.

Parameters:

index - position in the **Buffer** (p. 803) to write the data

value - the long longs to write.

Returns:

a reference to this buffer

Exceptions:

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. ***2685***) - If this buffer is read-only

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 2076).

6.420.3.17 virtual LongBuffer& decaf::nio::LongBuffer::put (long long *value*) throw (BufferOverflowException, ReadOnlyBufferException) [pure virtual]

Writes the given long longs long longo this buffer at the current position, and then increments the position.

Parameters:

value - the long longs value to be written

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException *(p. 834)* - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException *(p. 2685)* - If this buffer is read-only

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 2077).

6.420.3.18 LongBuffer& decaf::nio::LongBuffer::put (std::vector< long long > & *buffer*) throw (BufferOverflowException, ReadOnlyBufferException)

This method transfers the entire content of the given source long longs array long longo this buffer. This is the same as calling put(&buffer[0], 0, buffer.size()

Parameters:

buffer - The buffer whose contents are copied to this **LongBuffer** (p. 2079)

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException *(p. 834)* - If there is insufficient space in this buffer

ReadOnlyBufferException *(p. 2685)* - If this buffer is read-only

6.420.3.19 LongBuffer& decaf::nio::LongBuffer::put (const long long * *buffer*, std::size_t *offset*, std::size_t *length*) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)

This method transfers long longs long longo this buffer from the given source array. If there are more long longs to be copied from the array than remain in this buffer, that is, if length > **remaining()** (p. 808), then no long longs are transferred and a **BufferOverflowException** (p. 834) is thrown.

Otherwise, this method copies length bytes from the given array long longo this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by length.

Parameters:

buffer- The array from which long longs are to be read

offset- The offset within the array of the first long long to be read;

length - The number of long longs to be read from the given array

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException *(p. 834)* - If there is insufficient space in this buffer

ReadOnlyBufferException *(p. 2685)* - If this buffer is read-only

NullPolong longerException if the passed buffer is null.

6.420.3.20 LongBuffer& decaf::nio::LongBuffer::put (LongBuffer & *src*) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)

This method transfers the long longs remaining in the given source buffer long longo this buffer. If there are more long longs remaining in the source buffer than in this buffer, that is, if src.remaining() > **remaining()** (p. 808), then no long longs are transferred and a **BufferOverflowException** (p. 834) is thrown.

Otherwise, this method copies n = src.remaining() long longs from the given buffer long longo this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by n.

Parameters:

src - the buffer to take long longs from an place in this one.

Returns:

a reference to this buffer

Exceptions:

BufferOverflowException *(p. 834)* - If there is insufficient space in this buffer for the remaining long longs in the source buffer

IllegalArgumentException - If the source buffer is this buffer

ReadOnlyBufferException *(p. 2685)* - If this buffer is read-only

6.420.3.21 virtual LongBuffer* decaf::nio::LongBuffer::slice () const [pure virtual]

Creates a new **LongBuffer** (p. 2079) whose content is a shared subsequence of this buffer's content. The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns:

the newly create **LongBuffer** (p. 2079) which the caller owns.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 2077).

6.420.3.22 virtual std::string decaf::nio::LongBuffer::toString () const [virtual]

Returns:

a std::string describing this object

6.420.3.23 static LongBuffer* decaf::nio::LongBuffer::wrap (std::vector< long long > & *buffer*) [static]

Wraps the passed STL long long Vector in a **LongBuffer** (p. 2079). The new buffer will be backed by the given long long array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns:

a new **LongBuffer** (p. 2079) that is backed by buffer, caller owns.

6.420.3.24 static LongBuffer* decaf::nio::LongBuffer::wrap (long long * *array*, std::size_t *offset*, std::size_t *length*) throw (lang::exceptions::NullPointerException) [static]

Wraps the passed buffer with a new **LongBuffer** (p. 2079). The new buffer will be backed by the given long long array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters:

array - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns:

a new **LongBuffer** (p. 2079) that is backed by buffer, caller owns.

The documentation for this class was generated from the following file:

6.421 activemq::util::LongSequenceGenerator Class Reference

This class is used to generate a sequence of long long values that are incremented each time a new value is requested.

`#include <src/main/activemq/util/LongSequenceGenerator.h>`

Public Member Functions

- **LongSequenceGenerator** ()
- virtual ~**LongSequenceGenerator** ()
- long long **getNextSequenceId** ()
- long long **getLastSequenceId** ()

6.421.1 Detailed Description

This class is used to generate a sequence of long long values that are incremented each time a new value is requested. This class is thread safe so the ids can be requested in different threads safely.

6.421.2 Constructor & Destructor Documentation

6.421.2.1 activemq::util::LongSequenceGenerator::LongSequenceGenerator ()

6.421.2.2 virtual activemq::util::LongSequenceGenerator::~LongSequenceGenerator () [inline, virtual]

6.421.3 Member Function Documentation

6.421.3.1 long long activemq::util::LongSequenceGenerator::getLastSequenceId ()

Returns:

the last id that was generated.

6.421.3.2 long long activemq::util::LongSequenceGenerator::getNextSequenceId ()

Returns:

the next id in the sequence.

The documentation for this class was generated from the following file:

- src/main/activemq/util/**LongSequenceGenerator.h**

6.422 decaf::net::MalformedURLException Class Reference

`#include <src/main/decaf/net/MalformedURLException.h>`Inheritance diagram for decaf::net::MalformedURLException:

Public Member Functions

- **MalformedURLException** () throw ()
  Default Constructor.
- **MalformedURLException** (const Exception &ex) throw ()
  Conversion Constructor from some other Exception.
- **MalformedURLException** (const **MalformedURLException** &ex) throw ()
  Copy Constructor.
- **MalformedURLException** (const char *file, const int lineNumber, const std::exception ***cause**, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- **MalformedURLException** (const std::exception ***cause**) throw ()
  Constructor.
- **MalformedURLException** (const char *file, const int lineNumber, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **MalformedURLException** * **clone** () const
  Clones this exception.
- virtual ~**MalformedURLException** () throw ()

6.422.1 Constructor & Destructor Documentation

6.422.1.1 decaf::net::MalformedURLException::MalformedURLException () throw () [inline]

Default Constructor.

6.422.1.2 decaf::net::MalformedURLException::MalformedURLException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.422.1.3 decaf::net::MalformedURLException::MalformedURLException (const MalformedURLException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.422.1.4 decaf::net::MalformedURLException::MalformedURLException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.422.1.5 decaf::net::MalformedURLException::MalformedURLException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.422.1.6 decaf::net::MalformedURLException::MalformedURLException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.422.1.7 virtual decaf::net::MalformedURLException::~MalformedURLException () throw () [inline, virtual]

6.422.2 Member Function Documentation

6.422.2.1 virtual MalformedURLException* decaf::net::MalformedURLException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1822).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**MalformedURLException.h**

6.423 decaf::util::Map< K, V, COMPARATOR > Class Template Reference

Map (p. 2094) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

`#include <src/main/decaf/util/Map.h>`Inheritance diagram for decaf::util::Map< K, V, COMPARATOR >:

Data Structures

- class **Entry**

Public Member Functions

- **Map** ()

  Default constructor - does nothing.

- virtual ~**Map** ()
- virtual bool **equals** (const **Map** &source) const =0

  Comparison, equality is dependent on the method of determining if the element are equal.

- virtual void **copy** (const **Map** &source)=0

  Copies the content of the source map into this map.

- virtual void **clear** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException)

  Removes all keys and values from this map.

- virtual bool **containsKey** (const K &key) const =0

  Indicates whether or this map contains a value for the given key.

- virtual bool **containsValue** (const V &value) const =0

  Indicates whether or this map contains a value for the given value, i.e.

- virtual bool **isEmpty** () const =0
- virtual std::size_t **size** () const =0
- virtual V & **get** (const K &key)=0 throw (lang::exceptions::NoSuchElementException)

  *Gets the value mapped to the specified key in the **Map** (p. 2094).*

- virtual const V & **get** (const K &key) const =0 throw (lang::exceptions::NoSuchElementException)

  *Gets the value mapped to the specified key in the **Map** (p. 2094).*

- virtual void **put** (const K &key, const V &value)=0 throw (decaf::lang::exceptions::UnsupportedOperationException)

  Sets the value for the specified key.

- virtual void **putAll** (const **Map**< K, V, COMPARATOR > &other)=0 throw (decaf::lang::exceptions::UnsupportedOperationException)

  *Stores a copy of the Mappings contained in the other **Map** (p. 2094) in this one.*

- virtual V **remove** (const K &key)=0 throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

  Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

- virtual std::vector< K > **keySet** () const =0

  *Returns a **Set** (p. 2905) view of the mappings contained in this map.*

- virtual std::vector< V > **values** () const =0

6.423.1 Detailed Description

template<typename K, typename V, typename COMPARATOR = std::less<K>> class decaf::util::Map< K, V, COMPARATOR >

Map (p. 2094) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

6.423.2 Constructor & Destructor Documentation

6.423.2.1 template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::Map< K, V, COMPARATOR >::Map () [inline]

Default constructor - does nothing.

6.423.2.2 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual decaf::util::Map< K, V, COMPARATOR >::~Map () [inline, virtual]

6.423.3 Member Function Documentation

6.423.3.1 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::Map< K, V, COMPARATOR >::clear () throw (decaf::lang::exceptions::UnsupportedOperationException) [pure virtual]

Removes all keys and values from this map.

Exceptions:

UnsupportedOperationException if this map is unmodifiable.

Implemented in **decaf::util::concurrent::ConcurrentStlMap**< K, V, COMPARATOR > (p. 1106), **decaf::util::StlMap**< K, V, COMPARATOR >

(p. 3034), **decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >** (p. 1106), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 1106), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 1106), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1106), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1106), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1106), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 3034), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 3034), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 3034), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 3034), **decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >** (p. 3034), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 3034), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 3034), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 3034), **decaf::util::StlMap< int, Pointer< Command > >** (p. 3034), **decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >** (p. 3034), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 3034), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 3034).

6.423.3.2 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::Map< K, V, COMPARATOR >::containsKey (const K & *key*) const [pure virtual]

Indicates whether or this map contains a value for the given key.

Parameters:

key The key to look up.

Returns:

true if this map contains the value, otherwise false.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1107), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 3034), **decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >** (p. 1107), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 1107), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 1107), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1107), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1107), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1107), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 3034), **decaf::util::StlMap< std::string,**

WireFormatFactory * > (p. 3034), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 3034), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 3034), **decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >** (p. 3034), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 3034), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 3034), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 3034), **decaf::util::StlMap< int, Pointer< Command > >** (p. 3034), **decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >** (p. 3034), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 3034), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 3034).

6.423.3.3 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::Map< K, V, COMPARATOR >::containsValue (const V & *value*) const [pure virtual]

Indicates whether or this map contains a value for the given value, i.e. they are equal, this is done by operator== so the types must pass equivalence testing in this manner.

Parameters:

value The Value to look up.

Returns:

true if this map contains the value, otherwise false.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1107), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 3035), **decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >** (p. 1107), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 1107), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 1107), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1107), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1107), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1107), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 3035), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 3035), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 3035), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 3035), **decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >** (p. 3035), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 3035), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 3035), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 3035), **decaf::util::StlMap< int, Pointer< Command > >** (p. 3035), **decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >** (p. 3035), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 3035), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 3035).

6.423.3.4 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::Map< K, V, COMPARATOR >::copy (const Map< K, V, COMPARATOR > & *source*) [pure virtual]

Copies the content of the source map into this map. Erases all existing data in this map.

Parameters:

source The source object to copy from.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1107), and **decaf::util::StlMap< K, V, COMPARATOR >** (p. 3035).

6.423.3.5 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::Map< K, V, COMPARATOR >::equals (const Map< K, V, COMPARATOR > & *source*) const [pure virtual]

Comparison, equality is dependent on the method of determining if the element are equal.

Parameters:

source - **Map** (p. 2094) to compare to this one.

Returns:

true if the **Map** (p. 2094) passed is equal in value to this one.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1108), and **decaf::util::StlMap< K, V, COMPARATOR >** (p. 3035).

6.423.3.6 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual const V& decaf::util::Map< K, V, COMPARATOR >::get (const K & *key*) const throw (lang::exceptions::NoSuchElementException) [pure virtual]

Gets the value mapped to the specified key in the **Map** (p. 2094). If there is no element in the map whose key is equivalent to the key provided then a NoSuchElementException is thrown.

Parameters:

key The search key.

Returns:

A {const} reference to the value for the given key.

Exceptions:

NoSuchElementException if the key requests doesn't exist in the **Map** (p. 2094).

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1108), **decaf::util::StlMap< K, V, COMPARATOR >**

(p. 3036), **decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >** (p. 1108), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 1108), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 1108), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1108), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1108), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1108), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 3036), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 3036), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 3036), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 3036), **decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >** (p. 3036), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 3036), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 3036), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 3036), **decaf::util::StlMap< int, Pointer< Command > >** (p. 3036), **decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >** (p. 3036), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 3036), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 3036).

6.423.3.7 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual V& decaf::util::Map< K, V, COMPARATOR >::get (const K & *key*) throw (lang::exceptions::NoSuchElementException) [pure virtual]

Gets the value mapped to the specified key in the **Map** (p. 2094). If there is no element in the map whose key is equivalent to the key provided then a NoSuchElementException is thrown.

Parameters:

key The search key.

Returns:

A reference to the value for the given key.

Exceptions:

NoSuchElementException if the key requests doesn't exist in the **Map** (p. 2094).

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1109), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 3036), **decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >** (p. 1109), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 1109), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 1109), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR**

> (p. 1109), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1109), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1109), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 3036), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 3036), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 3036), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 3036), **decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >** (p. 3036), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 3036), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 3036), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 3036), **decaf::util::StlMap< int, Pointer< Command > >** (p. 3036), **decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >** (p. 3036), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 3036), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 3036).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::equals(), and decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::equals().

6.423.3.8 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::Map< K, V, COMPARATOR >::isEmpty () const [pure virtual]

Returns:

if the **Map** (p. 2094) contains any element or not, TRUE or FALSE

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1109), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 3037), **decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >** (p. 1109), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 1109), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 1109), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1109), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1109), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1109), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 3037), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 3037), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 3037), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 3037), **decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >** (p. 3037), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 3037), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 3037), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 3037), **decaf::util::StlMap< int, Pointer< Command > >** (p. 3037), **decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >** (p. 3037), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 3037), and

decaf::util::StlMap< std::string, cms::Topic * > (p. 3037).

6.423.3.9 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual std::vector<K> decaf::util::Map< K, V, COMPARATOR >::keySet () const [pure virtual]

Returns a **Set** (p. 2905) view of the mappings contained in this map. The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1833), **Set.remove** (p. 155), removeAll, retainAll and clear operations. It does not support the add or addAll operations.

Returns:

the entire set of keys in this map as a std::vector.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1109), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 3037), **decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >** (p. 1109), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 1109), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 1109), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1109), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1109), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1109), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 3037), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 3037), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 3037), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 3037), **decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >** (p. 3037), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 3037), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 3037), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 3037), **decaf::util::StlMap< int, Pointer< Command > >** (p. 3037), **decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >** (p. 3037), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 3037), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 3037).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::equals(), and decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::equals().

6.423.3.10 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::Map< K, V, COMPARATOR >::put (const K & *key*, const V & *value*) throw (decaf::lang::exceptions::UnsupportedOperationException) [pure virtual]

Sets the value for the specified key.

Parameters:

key The target key.

value The value to be set.

Exceptions:

UnsupportedOperationException if this map is unmodifiable.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1111), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 3038), **decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >** (p. 1111), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 1111), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 1111), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1111), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1111), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1111), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 3038), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 3038), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 3038), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 3038), **decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >** (p. 3038), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 3038), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 3038), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 3038), **decaf::util::StlMap< int, Pointer< Command > >** (p. 3038), **decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >** (p. 3038), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 3038), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 3038).

6.423.3.11 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::Map< K, V, COMPARATOR >::putAll (const Map< K, V, COMPARATOR > & *other*) throw (decaf::lang::exceptions::UnsupportedOperationException) [pure virtual]

Stores a copy of the Mappings contained in the other **Map** (p. 2094) in this one.

Parameters:

other A **Map** (p. 2094) instance whose elements are to all be inserted in this **Map** (p. 2094).

Exceptions:

UnsupportedOperationException If the implementing class does not support the putAll operation.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1111), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 3039), **decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >** (p. 1111), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 1111), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 1111), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1111), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1111), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1111), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 3039), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 3039), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 3039), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 3039), **decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >** (p. 3039), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 3039), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 3039), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 3039), **decaf::util::StlMap< int, Pointer< Command > >** (p. 3039), **decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >** (p. 3039), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 3039), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 3039).

6.423.3.12 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual V decaf::util::Map< K, V, COMPARATOR >::remove (const K & *key*) throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [pure virtual]

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Parameters:

key The search key.

Returns:

a copy of the element that was previously mapped to the given key

Exceptions:

NoSuchElementException if this key is not in the **Map** (p. 2094).

UnsupportedOperationException if this map is unmodifiable.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1113), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 3039), **decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >** (p. 1113), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 1113), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 1113), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1113), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1113), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1113), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 3039), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 3039), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 3039), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 3039), **decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >** (p. 3039), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 3039), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 3039), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 3039), **decaf::util::StlMap< int, Pointer< Command > >** (p. 3039), **decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >** (p. 3039), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 3039), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 3039).

6.423.3.13 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual std::size_t decaf::util::Map< K, V, COMPARATOR >::size () const [pure virtual]

Returns:

The number of elements (key/value pairs) in this map.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1114), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 3040), **decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >** (p. 1114), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 1114), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 1114), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1114), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1114), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1114), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 3040), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 3040), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 3040), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 3040), **decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >** (p. 3040), **decaf::util::StlMap< std::string,**

CachedConsumer * > (p. 3040), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 3040), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 3040), **decaf::util::StlMap< int, Pointer< Command > >** (p. 3040), **decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >** (p. 3040), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 3040), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 3040).

6.423.3.14 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual std::vector<V> decaf::util::Map< K, V, COMPARATOR >::values () const [pure virtual]

Returns:

the entire set of values in this map as a std::vector.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1115), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 3040), **decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >** (p. 1115), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 1115), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 1115), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1115), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1115), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1115), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 3040), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 3040), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 3040), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 3040), **decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >** (p. 3040), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 3040), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 3040), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 3040), **decaf::util::StlMap< int, Pointer< Command > >** (p. 3040), **decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >** (p. 3040), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 3040), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 3040).

The documentation for this class was generated from the following file:

- src/main/decaf/util/**Map.h**

6.424 cms::MapMessage Class Reference

A **MapMessage** (p. 2106) object is used to send a set of name-value pairs.

`#include <src/main/cms/MapMessage.h>`Inheritance diagram for cms::MapMessage:

Public Member Functions

- virtual ~**MapMessage** ()
- virtual std::vector< std::string > **getMapNames** () const =0 throw (CMSException)

  *Returns an Enumeration of all the names in the **MapMessage** (p. 2106) object.*

- virtual bool **itemExists** (const std::string &name) const =0 throw (CMSException)

  *Indicates whether an item exists in this **MapMessage** (p. 2106) object.*

- virtual bool **getBoolean** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSException)

  Returns the Boolean value of the Specified name.

- virtual void **setBoolean** (const std::string &name, bool value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Sets a boolean value with the specified name into the Map.

- virtual unsigned char **getByte** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSException)

  Returns the Byte value of the Specified name.

- virtual void **setByte** (const std::string &name, unsigned char value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Sets a Byte value with the specified name into the Map.

- virtual std::vector< unsigned char > **getBytes** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSException)

  Returns the Bytes value of the Specified name.

- virtual void **setBytes** (const std::string &name, const std::vector< unsigned char > &value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Sets a Bytes value with the specified name into the Map.

- virtual char **getChar** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSException)

  Returns the Char value of the Specified name.

- virtual void **setChar** (const std::string &name, char value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Sets a Char value with the specified name into the Map.

- virtual double **getDouble** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSException)

Returns the Double value of the Specified name.

- virtual void **setDouble** (const std::string &name, double value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Sets a Double value with the specified name into the Map.

- virtual float **getFloat** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSException)

  Returns the Float value of the Specified name.

- virtual void **setFloat** (const std::string &name, float value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Sets a Float value with the specified name into the Map.

- virtual int **getInt** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSException)

  Returns the Int value of the Specified name.

- virtual void **setInt** (const std::string &name, int value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Sets a Int value with the specified name into the Map.

- virtual long long **getLong** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSException)

  Returns the Long value of the Specified name.

- virtual void **setLong** (const std::string &name, long long value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Sets a Long value with the specified name into the Map.

- virtual short **getShort** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSException)

  Returns the Short value of the Specified name.

- virtual void **setShort** (const std::string &name, short value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Sets a Short value with the specified name into the Map.

- virtual std::string **getString** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSException)

  Returns the String value of the Specified name.

- virtual void **setString** (const std::string &name, const std::string &value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)

  Sets a String value with the specified name into the Map.

6.424.1 Detailed Description

A **MapMessage** (p. 2106) object is used to send a set of name-value pairs. The names are String objects, and the values are primitive data types in the Java programming language. The

names must have a value that is not null, and not an empty string. The entries can be accessed sequentially or randomly by name. The order of the entries is undefined. **MapMessage** (p. 2106) inherits from the **Message** (p. 2163) interface and adds a message body that contains a Map.

When a client receives a **MapMessage** (p. 2106), it is in read-only mode. If a client attempts to write to the message at this point, a **MessageNotWriteableException** (p. 2331) is thrown. To place the **MapMessage** (p. 2106) back into a state where it can be read from and written to, call the `clearBody` method.

MapMessage (p. 2106) objects support the following conversion table. The marked cases must be supported. The unmarked cases must throw a **CMSException** (p. 1031). The String-to-primitive conversions may throw a **MessageFormatException** (p. 2278) if the primitive's valueOf() method does not accept it as a valid String representation of the primitive.

A value written as the row type can be read as the column type.

	boolean	byte	short	char	int	long	float	double	String	byte[]
boolean	X								X	
byte		X	X		X	X			X	
short			X		X	X			X	
char				X					X	
int					X	X			X	
long						X			X	
float							X	X	X	
double								X	X	
String	X	X	X		X	X	X	X	X	
byte[]										X

6.424.2 Constructor & Destructor Documentation

6.424.2.1 virtual cms::MapMessage::~MapMessage () [inline, virtual]

6.424.3 Member Function Documentation

6.424.3.1 virtual bool cms::MapMessage::getBoolean (const std::string & *name*) const throw (cms::MessageFormatException, cms::CMSException) [pure virtual]

Returns the Boolean value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException (p. ***1031***) - if the operation fails due to an internal error.

MessageFormatExceptio - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 312).

6.424.3.2 virtual unsigned char cms::MapMessage::getByte (const std::string & *name*) const throw (cms::MessageFormatException, cms::CMSException) [pure virtual]

Returns the Byte value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException (p. ***1031***) - if the operation fails due to an internal error.

MessageFormatException (p. ***2278***) - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 313).

6.424.3.3 virtual std::vector<unsigned char> cms::MapMessage::getBytes (const std::string & *name*) const throw (cms::MessageFormatException, cms::CMSException) [pure virtual]

Returns the Bytes value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException (p. ***1031***) - if the operation fails due to an internal error.

MessageFormatException (p. ***2278***) - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 313).

6.424.3.4 virtual char cms::MapMessage::getChar (const std::string & *name*) const throw (cms::MessageFormatException, cms::CMSException) [pure virtual]

Returns the Char value of the Specified name.

Parameters:

name name of the value to fetch from the map

Exceptions:

CMSException (p. ***1031***) - if the operation fails due to an internal error.

MessageFormatException (p. ***2278***) - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 313).

6.424.3.5 virtual double cms::MapMessage::getDouble (const std::string & *name*) const throw (cms::MessageFormatException, cms::CMSException) [pure virtual]

Returns the Double value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException (p. ***1031***) - if the operation fails due to an internal error.

MessageFormatException (p. ***2278***) - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 314).

6.424.3.6 virtual float cms::MapMessage::getFloat (const std::string & *name*) const throw (cms::MessageFormatException, cms::CMSException) [pure virtual]

Returns the Float value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException (p. ***1031***) - if the operation fails due to an internal error.

MessageFormatException (p. ***2278***) - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 314).

6.424.3.7 virtual int cms::MapMessage::getInt (const std::string & *name*) const throw (cms::MessageFormatException, cms::CMSException) [pure virtual]

Returns the Int value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException (p. ***1031***) - if the operation fails due to an internal error.

MessageFormatException (p. ***2278***) - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 314).

6.424.3.8 virtual long long cms::MapMessage::getLong (const std::string & *name*) const throw (cms::MessageFormatException, cms::CMSException) [pure virtual]

Returns the Long value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException (p. ***1031***) - if the operation fails due to an internal error.

MessageFormatException (p. ***2278***) - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 315).

6.424.3.9 virtual std::vector< std::string > cms::MapMessage::getMapNames () const throw (CMSException) [pure virtual]

Returns an Enumeration of all the names in the **MapMessage** (p. 2106) object.

Returns:

STL Vector of String values, each of which is the name of an item in the **MapMessage** (p. 2106)

Exceptions:

CMSException (p. ***1031***) - if the operation fails due to an internal error.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 315).

6.424.3.10 virtual short cms::MapMessage::getShort (const std::string & *name*) const throw (cms::MessageFormatException, cms::CMSException) [pure virtual]

Returns the Short value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException (p. ***1031***) - if the operation fails due to an internal error.

MessageFormatException (p. ***2278***) - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 316).

6.424.3.11 virtual std::string cms::MapMessage::getString (const std::string & *name*) const throw (cms::MessageFormatException, cms::CMSException) [pure virtual]

Returns the String value of the Specified name.

Parameters:

name Name of the value to fetch from the map

Exceptions:

CMSException (p. ***1031***) - if the operation fails due to an internal error.

MessageFormatException (p. ***2278***) - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 316).

6.424.3.12 virtual bool cms::MapMessage::itemExists (const std::string & *name*) const throw (CMSException) [pure virtual]

Indicates whether an item exists in this **MapMessage** (p. 2106) object.

Parameters:

name String name of the Object in question

Returns:

boolean value indicating if the name is in the map

Exceptions:

CMSException (p. ***1031***) - if the operation fails due to an internal error.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 316).

6.424.3.13 virtual void cms::MapMessage::setBoolean (const std::string & *name*, bool *value*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Sets a boolean value with the specified name into the Map.

Parameters:

name the name of the boolean

value the boolean value to set in the Map

Exceptions:

CMSException (p. ***1031***) - if the operation fails due to an internal error.

MessageNotWritableException - if the **Message** (p. 2163) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 317).

6.424.3.14 virtual void cms::MapMessage::setByte (const std::string & *name*, unsigned char *value*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Sets a Byte value with the specified name into the Map.

Parameters:

name the name of the Byte

value the Byte value to set in the Map

Exceptions:

CMSException (p. ***1031***) - if the operation fails due to an internal error.

MessageNotWriteableException (p. ***2331***) - if the **Message** (p. 2163) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 317).

6.424.3.15 virtual void cms::MapMessage::setBytes (const std::string & *name*, const std::vector< unsigned char > & *value*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Sets a Bytes value with the specified name into the Map.

Parameters:

name The name of the Bytes

value The Bytes value to set in the Map

Exceptions:

CMSException (p. ***1031***) - if the operation fails due to an internal error.

MessageNotWriteableException (p. ***2331***) - if the **Message** (p. 2163) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 318).

6.424.3.16 virtual void cms::MapMessage::setChar (const std::string & *name*, char *value*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Sets a Char value with the specified name into the Map.

Parameters:

name the name of the Char

value the Char value to set in the Map

Exceptions:

CMSException (p. ***1031***) - if the operation fails due to an internal error.

MessageNotWriteableException *(p. 2331)* - if the **Message** (p. 2163) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 318).

6.424.3.17 virtual void cms::MapMessage::setDouble (const std::string & *name*, double *value*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Sets a Double value with the specified name into the Map.

Parameters:

name The name of the Double

value The Double value to set in the Map

Exceptions:

CMSException *(p. 1031)* - if the operation fails due to an internal error.

MessageNotWriteableException *(p. 2331)* - if the **Message** (p. 2163) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 318).

6.424.3.18 virtual void cms::MapMessage::setFloat (const std::string & *name*, float *value*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Sets a Float value with the specified name into the Map.

Parameters:

name The name of the Float

value The Float value to set in the Map

Exceptions:

CMSException *(p. 1031)* - if the operation fails due to an internal error.

MessageNotWriteableException *(p. 2331)* - if the **Message** (p. 2163) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 319).

6.424.3.19 virtual void cms::MapMessage::setInt (const std::string & *name*, int *value*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Sets a Int value with the specified name into the Map.

Parameters:

name The name of the Int

value The Int value to set in the Map

Exceptions:

CMSException *(p. 1031)* - if the operation fails due to an internal error.

MessageNotWriteableException *(p. 2331)* - if the **Message** (p. 2163) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 319).

6.424.3.20 virtual void cms::MapMessage::setLong (const std::string & *name*, long long *value*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Sets a Long value with the specified name into the Map.

Parameters:

name The name of the Long

value The Long value to set in the Map

Exceptions:

CMSException *(p. 1031)* - if the operation fails due to an internal error.

MessageNotWriteableException *(p. 2331)* - if the **Message** (p. 2163) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 319).

6.424.3.21 virtual void cms::MapMessage::setShort (const std::string & *name*, short *value*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Sets a Short value with the specified name into the Map.

Parameters:

name The name of the Short

value The Short value to set in the Map

Exceptions:

CMSException *(p. 1031)* - if the operation fails due to an internal error.

MessageNotWriteableException *(p. 2331)* - if the **Message** (p. 2163) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 320).

6.424.3.22 virtual void cms::MapMessage::setString (const std::string & *name*, const std::string & *value*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Sets a String value with the specified name into the Map.

Parameters:

name The name of the String

value The String value to set in the Map

Exceptions:

CMSException (p. ***1031***) - if the operation fails due to an internal error.

MessageNotWriteableException (p. ***2331***) - if the **Message** (p. 2163) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 320).

The documentation for this class was generated from the following file:

- src/main/cms/**MapMessage.h**

6.425 decaf::util::logging::MarkBlockLogger Class Reference

Defines a class that can be used to mark the entry and exit from scoped blocks.

`#include <src/main/decaf/util/logging/MarkBlockLogger.h>`

Public Member Functions

- **MarkBlockLogger** (**Logger** *logger, const std::string &blockName)
  Constructor - Marks Block entry.
- virtual ~**MarkBlockLogger** ()

6.425.1 Detailed Description

Defines a class that can be used to mark the entry and exit from scoped blocks. Create an instance of this class at the start of a scoped block, passing it the logger to use and the name of the block. The block entry and exit will be marked using the scope name, logger to the logger at the MARKBLOCK log level.

6.425.2 Constructor & Destructor Documentation

6.425.2.1 decaf::util::logging::MarkBlockLogger::MarkBlockLogger (Logger * *logger*, const std::string & *blockName*) [inline]

Constructor - Marks Block entry.

Parameters:

logger **Logger** (p. 2028) to use

blockName Block name

6.425.2.2 virtual decaf::util::logging::MarkBlockLogger::~MarkBlockLogger () [inline, virtual]

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**MarkBlockLogger.h**

6.426 activemq::wireformat::MarshalAware Class Reference

`#include <src/main/activemq/wireformat/MarshalAware.h>`Inheritance diagram for activemq::wireformat::MarshalAware:

Public Member Functions

- virtual ~**MarshalAware** ()
- virtual bool **isMarshalAware** () const =0

  Determine if the class implementing this interface is really wanting to be told about marshaling.

- virtual void **beforeMarshal** (**WireFormat** *wireFormat)=0 throw (decaf::io::IOException)

  Called before marshaling is started to prepare the object to be marshaled.

- virtual void **afterMarshal** (**WireFormat** *wireFormat)=0 throw (decaf::io::IOException)

  Called after marshaling is started to cleanup the object being marshaled.

- virtual void **beforeUnmarshal** (**WireFormat** *wireFormat)=0 throw (decaf::io::IOException)

  Called before unmarshaling is started to prepare the object to be unmarshaled.

- virtual void **afterUnmarshal** (**WireFormat** *wireFormat)=0 throw (decaf::io::IOException)

  Called after unmarshaling is started to cleanup the object being unmarshaled.

- virtual void **setMarshaledForm** (**WireFormat** *wireFormat, const std::vector< char > &data)=0

  Called to set the data to this object that will contain the objects marshaled form.

- virtual std::vector< unsigned char > **getMarshaledForm** (**WireFormat** *wireFormat)=0

  Called to get the data to this object that will contain the objects marshaled form.

6.426.1 Constructor & Destructor Documentation

6.426.1.1 virtual activemq::wireformat::MarshalAware::~MarshalAware () [inline, virtual]

6.426.2 Member Function Documentation

6.426.2.1 virtual void activemq::wireformat::MarshalAware::afterMarshal (WireFormat * *wireFormat*) throw (decaf::io::IOException) [pure virtual]

Called after marshaling is started to cleanup the object being marshaled.

Parameters:

wireFormat - the wireformat object to control marshaling

6.426.2.2 virtual void activemq::wireformat::MarshalAware::afterUnmarshal (WireFormat * *wireFormat*) throw (decaf::io::IOException) [pure virtual]

Called after unmarshaling is started to cleanup the object being unmarshaled.

Parameters:

wireFormat - the wireformat object to control unmarshaling

6.426.2.3 virtual void activemq::wireformat::MarshalAware::beforeMarshal (WireFormat * *wireFormat*) throw (decaf::io::IOException) [pure virtual]

Called before marshaling is started to prepare the object to be marshaled.

Parameters:

wireFormat - the wireformat object to control marshaling

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 311), and **activemq::commands::ActiveMQTextMessage** (p. 574).

6.426.2.4 virtual void activemq::wireformat::MarshalAware::beforeUnmarshal (WireFormat * *wireFormat*) throw (decaf::io::IOException) [pure virtual]

Called before unmarshaling is started to prepare the object to be unmarshaled.

Parameters:

wireFormat - the wireformat object to control unmarshaling

6.426.2.5 virtual std::vector<unsigned char> activemq::wireformat::MarshalAware::getMarshaledForm (WireFormat * *wireFormat*) [pure virtual]

Called to get the data to this object that will contain the objects marshaled form.

Parameters:

wireFormat - the wireformat object to control unmarshaling

Returns:

buffer that holds the objects data.

6.426.2.6 virtual bool activemq::wireformat::MarshalAware::isMarshalAware () const [pure virtual]

Determine if the class implementing this interface is really wanting to be told about marshaling. Normally if you didn't want to be marshal aware you just wouldn't implement this interface but since this is C++ and we don't have true interfaces we need a flat inheritance hierarchy, so we always implement this.

Returns:

true if this class cares about marshaling.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 316), **activemq::commands::BaseDataStructure** (p. 717), **activemq::commands::Message** (p. 2155), and **activemq::commands::WireFormatInfo** (p. 3374).

6.426.2.7 virtual void activemq::wireformat::MarshalAware::setMarshaledForm (WireFormat * *wireFormat*, const std::vector< char > & *data*) [pure virtual]

Called to set the data to this object that will contain the objects marshaled form.

Parameters:

wireFormat - the wireformat object to control unmarshaling

data - vector of object binary data

  Returns the absolute value of a double value.

- static double **sqrt** (double value)

  Returns the arc cosine of an angle, in the range of 0.0 through pi.

- static double **pow** (double base, double exp)

  Returns the value of the first argument raised to the power of the second argument.

- static short **min** (short a, short b)

  Returns the double value that is closest in value to the argument and is equal to a mathematical integer.

- static int **min** (int a, int b)

  Returns the smaller of two ***int*** *values.*

- static int **min** (unsigned int a, unsigned int b)

  Returns the smaller of two ***unsigned int*** *values.*

- static long long **min** (long long a, long long b)

  Returns the smaller of two ***long long*** *values.*

- static float **min** (float a, float b)

  Returns the smaller of two float values.

- static double **min** (double a, double b)

  Returns the smaller of two double values.

- static short **max** (short a, short b)

  Returns the larger of two `short` *values.*

- static int **max** (int a, int b)

  Returns the larger of two `int` *values.*

- static long long **max** (long long a, long long b)

  Returns the larger of two `long long` *values.*

- static float **max** (float a, float b)

  Returns the greater of two float values.

- static double **max** (double a, double b)

  Returns the greater of two double values.

- static double **ceil** (double value)

  Returns the natural logarithm (base e) of a double value.

- static double **floor** (double value)

  Returns the largest (closest to positive infinity) double value that is less than or equal to the argument and is equal to a mathematical integer.

- static int **round** (float value)

  Returns the closest int to the argument.

- static long long **round** (double value)

  Returns the closest long long to the argument.

- static double **random** ()

  Computes the remainder operation on two arguments as prescribed by the IEEE 754 standard.

- static float **signum** (float value)

  Returns Euler's number e raised to the power of a double value.

- static double **signum** (double value)

  Returns the signum function of the argument; zero if the argument is zero, 1.0f if the argument is greater than zero, -1.0f if the argument is less than zero.

- static double **toRadians** (double angdeg)

  Returns the measure in radians of the supplied degree angle.

- static double **toDegrees** (double angrad)

  Returns the measure in degrees of the supplied radian angle.

Static Public Attributes

- static const double **E**
- static const double **PI**

6.432.1 Detailed Description

The class `Math` (p. 2126) contains methods for performing basic numeric operations such as the elementary exponential, logarithm, square root, and trigonometric functions.

6.432.2 Constructor & Destructor Documentation

6.432.2.1 decaf::lang::Math::Math () [inline]

6.432.2.2 virtual decaf::lang::Math::~Math () [inline, virtual]

6.432.3 Member Function Documentation

6.432.3.1 static double decaf::lang::Math::abs (double *value*) [static]

Returns the absolute value of a double value. If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned. Special cases:

o If the argument is positive zero or negative zero, the result is positive zero. o If the argument is infinite, the result is positive infinity. o If the argument is NaN, the result is NaN.

In other words, the result is the same as the value of the expression: **Double::longBitsToDouble** (p. 1543)(0x7fffffffffffffffULL & Double::doubleToLongBits(value))

Parameters:

value - the value to return the abs of

Returns:

the value if positive, otherwise the negative of value

6.432.3.2 static float decaf::lang::Math::abs (float *value*) [static]

Returns the absolute value of a float value. If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned. Special cases:

o If the argument is positive zero or negative zero, the result is positive zero. o If the argument is infinite, the result is positive infinity. o If the argument is NaN, the result is NaN.

In other words, the result is the same as the value of the expression: **Float::intBitsToFloat** (p. 1652)(0x7fffffff & Float::floatToIntBits(value))

Parameters:

value - the value to return the abs of

Returns:

the value if positive, otherwise the negative of value

6.432.3.3 static long long decaf::lang::Math::abs (long long *value*) [inline, static]

Returns the absolute value of an long long value. If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned.

Parameters:

value - the value to return the abs of

Returns:

the value if positive, otherwise the negative of value

6.432.3.4 static int decaf::lang::Math::abs (int *value*) [inline, static]

Returns the absolute value of an int value. If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned.

Parameters:

value - the value to return the abs of

Returns:

the value if positive, otherwise the negative of value

6.432.3.5 static double decaf::lang::Math::ceil (double *value*) [static]

Returns the natural logarithm (base e) of a double value. Special cases:

o If the argument is NaN or less than zero, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is positive zero or negative zero, then the result is negative infinity.

Parameters:

value the value to compute the natural log of.

Returns:

the natural log of value. Returns the base 10 logarithm of a double value. Special cases:

o If the argument is NaN or less than zero, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is positive zero or negative zero, then the result is negative infinity. o If the argument is equal to 10n for integer n, then the result is n.

Parameters:

value - the value to operate on

Returns:

the long base 10 of value Returns the natural logarithm of the sum of the argument and 1. Note that for small values x, the result of log1p(x) is much closer to the true result of ln(1 + x) than the floating-point evaluation of log(1.0+x).

Special cases:

o If the argument is NaN or less than -1, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is negative one, then the result is negative infinity. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the value to operate on

Returns:

the the value ln(x + 1), the natural log of x + 1 Returns the smallest (closest to negative infinity) double value that is greater than or equal to the argument and is equal to a mathematical integer. Special cases:

o If the argument value is already equal to a mathematical integer, then the result is the same as the argument. o If the argument is NaN or an infinity or positive zero or negative zero, then the result is the same as the argument. o If the argument value is less than zero but greater than -1.0, then the result is negative zero.

Note that the value of Math.ceil(x) is exactly the value of -Math.floor(-x).

Parameters:

value - the value to find the ceiling of

Returns:

the smallest (closest to negative infinity) floating-point value that is greater than or equal to the argument and is equal to a mathematical integer.

6.432.3.6 static double decaf::lang::Math::floor (double *value*) [static]

Returns the largest (closest to positive infinity) double value that is less than or equal to the argument and is equal to a mathematical integer. Special cases:

o If the argument value is already equal to a mathematical integer, then the result is the same as the argument. o If the argument is NaN or an infinity or positive zero or negative zero, then the result is the same as the argument.

Parameters:

value - the value to find the floor of

Returns:

the largest (closest to positive infinity) floating-point value that less than or equal to the argument and is equal to a mathematical integer.

6.432.3.7 static double decaf::lang::Math::max (double *a*, double *b*) [static]

Returns the greater of two double values. That is, the result is the argument closer to positive infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other negative zero, the result is positive zero.

Parameters:

a - an argument.

b - another argument.

Returns:

the larger of `a` and `b`.

6.432.3.8 static float decaf::lang::Math::max (float *a*, float *b*) [static]

Returns the greater of two float values. That is, the result is the argument closer to positive infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other negative zero, the result is positive zero.

Parameters:

a - an argument.

b - another argument.

Returns:

the larger of `a` and `b`.

6.432.3.9 static long long decaf::lang::Math::max (long long *a*, long long *b*) [inline, static]

Returns the larger of two `long long` values. That is, the result the argument closer to the value of `Long::MAX_VALUE` (p. 2070). If the arguments have the same value, the result is that same value.

Parameters:

a - an argument.

b - another argument.

Returns:

the larger of `a` and `b`.

6.432.3.10 static int decaf::lang::Math::max (int *a*, int *b*) [inline, static]

Returns the larger of two `int` values. That is, the result the argument closer to the value of `Integer::MAX_VALUE` (p. 1775). If the arguments have the same value, the result is that same value.

Parameters:

a - an argument.

b - another argument.

Returns:

the larger of `a` and `b`.

6.432.3.11 static short decaf::lang::Math::max (short *a*, short *b*) [inline, static]

Returns the larger of two `short` values. That is, the result the argument closer to the value of `Short::MAX_VALUE` (p. 2914). If the arguments have the same value, the result is that same value.

Parameters:

a - an argument.

b - another argument.

Returns:

the larger of `a` and `b`.

6.432.3.12 static double decaf::lang::Math::min (double *a*, double *b*) [static]

Returns the smaller of two double values. That is, the result is the value closer to negative infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other is negative zero, the result is negative zero.

Parameters:

a - an argument.

b - another argument.

Returns:

the smaller of `a` and `b`.

6.432.3.13 static float decaf::lang::Math::min (float *a*, float *b*) [static]

Returns the smaller of two float values. That is, the result is the value closer to negative infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other is negative zero, the result is negative zero.

Parameters:

a - an argument.

b - another argument.

Returns:

the smaller of `a` and `b`.

6.432.3.14 static long long decaf::lang::Math::min (long long *a*, long long *b*) [inline, static]

Returns the smaller of two `long long` values. That is, the result the argument closer to the value of `Long::MIN_VALUE` (p. 2070). If the arguments have the same value, the result is that same value.

Parameters:

a - an argument.

b - another argument.

Returns:

the smaller of `a` and `b`.

6.432.3.15 static int decaf::lang::Math::min (unsigned int *a*, unsigned int *b*) [inline, static]

Returns the smaller of two `unsigned int` values. That is, the result the argument closer to the value of `Integer::MIN_VALUE` (p. 1776). If the arguments have the same value, the result is that same value.

Parameters:

a - an argument.

b - another argument.

Returns:

the smaller of `a` and `b`.

6.432.3.16 static int decaf::lang::Math::min (int *a*, int *b*) [inline, static]

Returns the smaller of two `int` values. That is, the result the argument closer to the value of `Integer::MIN_VALUE` (p. 1776). If the arguments have the same value, the result is that same value.

Parameters:

a - an argument.

b - another argument.

Returns:

the smaller of `a` and `b`.

6.432.3.17 static short decaf::lang::Math::min (short *a*, short *b*) [inline, static]

Returns the double value that is closest in value to the argument and is equal to a mathematical integer. If two double values that are mathematical integers are equally close, the result is the integer value that is even. Special cases:

o If the argument value is already equal to a mathematical integer, then the result is the same as the argument. o If the argument is NaN or an infinity or positive zero or negative zero, then the result is the same as the argument.

Parameters:

value - the value to round to the nearest integer

Returns:

the rounded value Returns the smaller of two short values. That is, the result is the argument closer to the value of `decaf.lang.Short::MIN_VALUE` (p. 2914). If the arguments have the same value, the result is that same value.

Parameters:

a - an argument.

b - another argument.

Returns:

the smaller of `a` and `b`.

6.432.3.18 static double decaf::lang::Math::pow (double *base*, double *exp*) [static]

Returns the value of the first argument raised to the power of the second argument. Special cases:

o If the second argument is positive or negative zero, then the result is 1.0. o If the second argument is 1.0, then the result is the same as the first argument. o If the second argument is NaN, then the result is NaN. o If the first argument is NaN and the second argument is nonzero, then the result is NaN.

Parameters:

base - the base

exp - the exponent

Returns:

the base raised to the power of exp.

6.432.3.19 static double decaf::lang::Math::random () [static]

Computes the remainder operation on two arguments as prescribed by the IEEE 754 standard. The remainder value is mathematically equal to f1 - f2 $\times$ n, where n is the mathematical integer closest to the exact mathematical value of the quotient f1/f2, and if two mathematical integers are equally close to f1/f2, then n is the integer that is even. If the remainder is zero, its sign is the same as the sign of the first argument. Special cases:

o If either argument is NaN, or the first argument is infinite, or the second argument is positive zero or negative zero, then the result is NaN. o If the first argument is finite and the second argument is infinite, then the result is the same as the first argument.

Parameters:

f1 - the dividend.

f2 - the divisor

Returns:

the IEEE remainder of value Returns a double value with a positive sign, greater than or equal to 0.0 and less than 1.0. Returned values are chosen pseudorandomly with (approximately) uniform distribution from that range.

When this method is first called, it creates a single new pseudorandom-number generator; This new pseudorandom-number generator is used thereafter for all calls to this method and is used nowhere else.

This method is properly synchronized to allow correct use by more than one thread. However, if many threads need to generate pseudorandom numbers at a great rate, it may reduce contention for each thread to have its own pseudorandom-number generator.

Returns:

a pseudorandom double greater than or equal to 0.0 and less than 1.0.

6.432.3.20 static long long decaf::lang::Math::round (double *value*) [static]

Returns the closest long long to the argument. The result is rounded to an integer by adding 1/2, taking the floor of the result, and casting the result to type long long. In other words, the result is equal to the value of the expression: (long long)**Math.floor** (p. 2130)(a + 0.5d)

o If the argument is NaN, the result is 0. o If the argument is negative infinity or any value less than or equal to the value of **Long::MIN_VALUE** (p. 2070), the result is equal to the value of **Long::MIN_VALUE** (p. 2070). o If the argument is positive infinity or any value greater than or equal to the value of **Long::MAX_VALUE** (p. 2070), the result is equal to the value of **Long::MAX_VALUE** (p. 2070).

Parameters:

value - the value to round

Returns:

the value of the argument rounded to the nearest integral value.

6.432.3.21 static int decaf::lang::Math::round (float *value*) [static]

Returns the closest int to the argument. The result is rounded to an integer by adding 1/2, taking the floor of the result, and casting the result to type int. In other words, the result is equal to the value of the expression: (int)**Math.floor** (p. 2130)(a + 0.5f)

o If the argument is NaN, the result is 0. o If the argument is negative infinity or any value less than or equal to the value of **Integer::MIN_VALUE** (p. 1776), the result is equal to the value of **Integer::MIN_VALUE** (p. 1776). o If the argument is positive infinity or any value greater than or equal to the value of **Integer::MAX_VALUE** (p. 1775), the result is equal to the value of **Integer::MAX_VALUE** (p. 1775).

Parameters:

value - the value to round

Returns:

the value of the argument rounded to the nearest integral value.

6.432.3.22 static double decaf::lang::Math::signum (double *value*) [static]

Returns the signum function of the argument; zero if the argument is zero, 1.0f if the argument is greater than zero, -1.0f if the argument is less than zero. Special Cases:

o If the argument is NaN, then the result is NaN. o If the argument is positive zero or negative zero, then the result is the same as the argument.

Parameters:

value - the floating-point value whose signum is to be returned

Returns:

the signum function of the argument

6.432.3.23 static float decaf::lang::Math::signum (float *value*) [static]

Returns Euler's number e raised to the power of a double value. Special cases:

o If the argument is NaN, the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is negative infinity, then the result is positive zero.

Parameters:

value - the exponent to raise e to

Returns:

the value e^a, where e is the base of the natural logarithms. Returns e^x - 1. Note that for values of x near 0, the exact sum of expm1(x) + 1 is much closer to the true result of ex than exp(x). Special cases:

o If the argument is NaN, the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is negative infinity, then the result is -1.0. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the value to raise e^x - 1

Returns:

the value ex - 1. Returns sqrt(x^2 + y^2) without intermediate overflow or underflow. Special cases:

If either argument is infinite, then the result is positive infinity. If either argument is NaN and neither argument is infinite, then the result is NaN.

Parameters:

x - an argument

y - another argument

Returns:

the sqrt(x^2 + y^2) without intermediate overflow or underflow Returns the signum function of the argument; zero if the argument is zero, 1.0f if the argument is greater than zero, -1.0f if the argument is less than zero. Special Cases:

o If the argument is NaN, then the result is NaN. o If the argument is positive zero or negative zero, then the result is the same as the argument.

Parameters:

value - the floating-point value whose signum is to be returned

Returns:

the signum function of the argument

6.432.3.24 static double decaf::lang::Math::sqrt (double *value*) [static]

Returns the arc cosine of an angle, in the range of 0.0 through pi. Special case:

o If the argument is NaN or its absolute value is greater than 1, then the result is NaN.

Parameters:

value - the value to return the arc cosine of.

Returns:

arc cosine of value in radians. Returns the arc sine of an angle, in the range of -pi/2 through pi/2. Special cases:

o If the argument is NaN or its absolute value is greater than 1, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the value to return the arc cosine of.

Returns:

arc cosine of value in radians. Returns the arc tangent of an angle, in the range of -pi/2 through pi/2. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the value to return the arc cosine of.

Returns:

arc tangent of value in radians. Converts rectangular coordinates (x, y) to polar (r, theta). This method computes the phase theta by computing an arc tangent of y/x in the range of -pi to pi. Special cases:

o If either argument is NaN, then the result is NaN. o If the first argument is positive zero and the second argument is positive, or the first argument is positive and finite and the second argument is positive infinity, then the result is positive zero. o If the first argument is negative zero and the second argument is positive, or the first argument is negative and finite and the second argument is positive infinity, then the result is negative zero. o If the first argument is positive zero and the second argument is negative, or the first argument is positive and finite and the second argument is negative infinity, then the result is the double value closest to pi. o If the first argument is negative zero and the second argument is negative, or the first argument is negative and finite and the second argument is negative infinity, then the result is the double value closest to -pi. o If the first argument is positive and the second argument is positive zero or negative zero, or the first argument is positive infinity and the second argument is finite, then the result is the double value closest to pi/2. o If the first argument is negative and the second argument is positive zero or negative zero, or the first argument is negative infinity and the second argument is finite, then the result is the double value closest to -pi/2. o If both arguments are positive infinity, then the result is the double value closest to pi/4. o If the first argument is positive infinity and the second argument is negative infinity, then the result is the double value closest to 3∗pi/4. o If the first argument is negative infinity and the second argument is positive infinity, then the result is the double value closest to -pi/4. o If both arguments are negative infinity, then the result is the double value closest to -3∗pi/4.

Parameters:

y - the ordinate coordinate

x - the abscissa coordinate

Returns:

the theta component of the point (r, theta) in polar coordinates that corresponds to the point (x, y) in Cartesian coordinates. Returns the cube root of a double value. For positive finite x, cbrt(-x) == -cbrt(x); that is, the cube root of a negative value is the negative of the cube root of that value's magnitude. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is infinite, then the result is an infinity with the same sign as the argument. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the double to compute the cube root of

Returns:

the cube root of value Returns the trigonometric cosine of an angle. Special cases:

o If the argument is NaN or an infinity, then the result is NaN.

Parameters:

value - an value in radians

Returns:

the cosine of the argument. Returns the hyperbolic cosine of a double value. The hyperbolic cosine of x is defined to be (ex + e-x)/2 where e is Euler's number. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is infinite, then the result is positive infinity. o If the argument is zero, then the result is 1.0.

Parameters:

value - the number whose hyperbolic cosine is to be found

Returns:

the hyperbolic cosine of value Returns the trigonometric sine of an angle. Special case:

o If the argument is NaN or an infinity, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the number whose sin is to be found

Returns:

the sine of value Returns the hyperbolic sine of a double value. The hyperbolic sine of x is defined to be (ex - e-x)/2 where e is Euler's number. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is infinite, then the result is an infinity with the same sign as the argument. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the number whose hyperbolic sin is to be found

Returns:

the hyperbolic sine of value Returns the trigonometric tangent of an angle. Special cases:

o If the argument is NaN or an infinity, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters:

value - the number whose tangent is to be found

Returns:

the tangent of value Returns the hyperbolic tangent of a double value. The hyperbolic tangent of x is defined to be (ex - e-x)/(ex + e-x), in other words, sinh(x)/cosh(x). Note that the absolute value of the exact tanh is always less than 1. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument. o If the argument is positive infinity, then the result is +1.0. o If the argument is negative infinity, then the result is -1.0.

Parameters:

value - the number whose hyperbolic tangent is to be found

Returns:

the hyperbolic cosine of value Returns the correctly rounded positive square root of a double value. Special cases:

o If the argument is NaN or less than zero, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is positive zero or negative zero, then the result is the same as the argument.

Otherwise, the result is the double value closest to the true mathematical square root of the argument value.

Parameters:

value - the value to find the square root of

the square root of the argument.

6.432.3.25 static double decaf::lang::Math::toDegrees (double *angrad*) [inline, static]

Returns the measure in degrees of the supplied radian angle.

Parameters:

angrad - an angle in radians

Returns:

the degree measure of the angle.

6.432.3.26 static double decaf::lang::Math::toRadians (double *angdeg*) [inline, static]

Returns the measure in radians of the supplied degree angle.

Parameters:

angdeg - an angle in degrees

Returns:

the radian measure of the angle.

6.432.4 Field Documentation

6.432.4.1 const double decaf::lang::Math::E [static]

6.432.4.2 const double decaf::lang::Math::PI [static]

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Math.h**

6.433 activemq::util::MemoryUsage Class Reference

`#include <src/main/activemq/util/MemoryUsage.h>`Inheritance diagram for activemq::util::MemoryUsage:

Public Member Functions

- **MemoryUsage** ()

  Default Constructor.

- **MemoryUsage** (unsigned long long limit)

  *Creates an instance of an **Usage** (p. 3351) monitor with a set limit.*

- virtual ~**MemoryUsage** ()
- virtual void **waitForSpace** ()

  *Waits forever for more space to be returned to this **Usage** (p. 3351) Manager.*

- virtual void **waitForSpace** (unsigned int timeout)

  *Waits for more space to be returned to this **Usage** (p. 3351) Manager, times out when the given time span in milliseconds elapses.*

- virtual void **enqueueUsage** (unsigned long long value)

  Tries to increase the usage by value amount but blocks if this object is currently full.

- virtual void **increaseUsage** (unsigned long long value)

  Increases the usage by the value amount.

- virtual void **decreaseUsage** (unsigned long long value)

  Decreases the usage by the value amount.

- virtual bool **isFull** () const

  *Returns true if this **Usage** (p. 3351) instance is full, i.e.*

- unsigned long long **getUsage** () const

  Gets the current usage amount.

- void **setUsage** (unsigned long long usage)

  Sets the current usage amount.

- unsigned long long **getLimit** () const

  Gets the current limit amount.

- void **setLimit** (unsigned long long limit)

  Sets the current limit amount.

6.433.1 Constructor & Destructor Documentation

6.433.1.1 activemq::util::MemoryUsage::MemoryUsage ()

Default Constructor.

6.433.1.2 activemq::util::MemoryUsage::MemoryUsage (unsigned long long *limit*)

Creates an instance of an **Usage** (p. 3351) monitor with a set limit.

Parameters:

limit - amount of memory this manager allows.

6.433.1.3 virtual activemq::util::MemoryUsage::~MemoryUsage () [virtual]

6.433.2 Member Function Documentation

6.433.2.1 virtual void activemq::util::MemoryUsage::decreaseUsage (unsigned long long *value*) [virtual]

Decreases the usage by the value amount.

Parameters:

value Amount of space to return to the pool

Implements **activemq::util::Usage** (p. 3351).

6.433.2.2 virtual void activemq::util::MemoryUsage::enqueueUsage (unsigned long long *value*) [inline, virtual]

Tries to increase the usage by value amount but blocks if this object is currently full.

Parameters:

value Amount of usage in bytes to add.

Implements **activemq::util::Usage** (p. 3351).

6.433.2.3 unsigned long long activemq::util::MemoryUsage::getLimit () const [inline]

Gets the current limit amount.

Returns:

the amount that can be used before full.

6.433.2.4 unsigned long long activemq::util::MemoryUsage::getUsage () const [inline]

Gets the current usage amount.

Returns:

the amount of bytes currently used.

6.433.2.5 virtual void activemq::util::MemoryUsage::increaseUsage (unsigned long long *value*) [virtual]

Increases the usage by the value amount.

Parameters:

value Amount of usage to add.

Implements **activemq::util::Usage** (p. 3352).

6.433.2.6 virtual bool activemq::util::MemoryUsage::isFull () const [virtual]

Returns true if this **Usage** (p. 3351) instance is full, i.e. **Usage** (p. 3351) >= 100%

Implements **activemq::util::Usage** (p. 3352).

6.433.2.7 void activemq::util::MemoryUsage::setLimit (unsigned long long *limit*) [inline]

Sets the current limit amount.

Parameters:

limit - The amount that can be used before full.

6.433.2.8 void activemq::util::MemoryUsage::setUsage (unsigned long long *usage*) [inline]

Sets the current usage amount.

Parameters:

usage - The amount to tag as used.

6.433.2.9 virtual void activemq::util::MemoryUsage::waitForSpace (unsigned int *timeout*) [virtual]

Waits for more space to be returned to this **Usage** (p. 3351) Manager, times out when the given time span in milliseconds elapses.

Parameters:

timeout The time to wait for more space.

Implements **activemq::util::Usage** (p. 3352).

6.433.2.10 virtual void activemq::util::MemoryUsage::waitForSpace () [virtual]

Waits forever for more space to be returned to this **Usage** (p. 3351) Manager.

Implements **activemq::util::Usage** (p. 3352).

The documentation for this class was generated from the following file:

- src/main/activemq/util/**MemoryUsage.h**

6.434 activemq::commands::Message Class Reference

`#include <src/main/activemq/commands/Message.h>`Inheritance diagram for activemq::commands::Message:

Public Member Functions

- **Message** ()
- virtual ~**Message** ()
- virtual unsigned char **getDataStructureType** () const

  Get the unique identifier that this object and its own Marshaler share.

- virtual **Message** * **cloneDataStructure** () const

  Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

  Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure*** (p. *1461) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure*** (p. *1461) passed in to this one, and returns if they are equivalent.*

- virtual void **beforeMarshal** (**wireformat::WireFormat** *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)

  Handles the marshaling of the objects properties into the internal byte array before the object is marshaled to the wire.

- virtual void **afterUnmarshal** (**wireformat::WireFormat** *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)

  Called after unmarshaling is started to cleanup the object being unmarshaled.

- virtual bool **isMarshalAware** () const

  Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.

- virtual void **setAckHandler** (const **Pointer**< **core::ActiveMQAckHandler** > &handler)

  *Sets the Acknowledgment Handler that this **Message*** (p. *2145) will use when the Acknowledge method is called.*

- virtual **Pointer**< **core::ActiveMQAckHandler** > **getAckHandler** () const

  *Gets the Acknowledgment Handler that this **Message*** (p. *2145) will use when the Acknowledge method is called.*

- virtual unsigned int **getSize** () const

Returns the Size of this message in Bytes.

- virtual bool **isExpired** () const

  Returns if this message has expired, meaning that its Expiration time has elapsed.

- virtual void **onSend** ()

  *Allows derived **Message** (p. 2145) classes to perform tasks before a message is sent.*

- **util::PrimitiveMap** & **getMessageProperties** ()

  Gets a reference to the Message's Properties object, allows the derived classes to get and set their own specific properties.

- const **util::PrimitiveMap** & **getMessageProperties** () const
- bool **isReadOnlyProperties** () const

  *Returns if the **Message** (p. 2145) Properties Are Read Only.*

- void **setReadOnlyProperties** (bool value)

  *Set the Read Only State of the **Message** (p. 2145) Properties.*

- bool **isReadOnlyBody** () const

  *Returns if the **Message** (p. 2145) Body is Read Only.*

- void **setReadOnlyBody** (bool value)

  *Set the Read Only State of the **Message** (p. 2145) Content.*

- virtual const **Pointer< ProducerId >** & **getProducerId** () const

6.434.1 Constructor & Destructor Documentation

6.434.1.1 activemq::commands::Message::Message (const Message &) [inline, protected]

6.434.1.2 activemq::commands::Message::Message ()

6.434.1.3 virtual activemq::commands::Message::~Message () [virtual]

6.434.2 Member Function Documentation

6.434.2.1 virtual void activemq::commands::Message::afterUnmarshal (wireformat::WireFormat *wireFormat *AMQCPP_UNUSED*) throw (decaf::io::IOException) [virtual]

Called after unmarshaling is started to cleanup the object being unmarshaled.

Parameters:

wireFormat - the wireformat object to control unmarshaling

Reimplemented from **activemq::commands::BaseDataStructure** (p. 716).

6.434.2.2 virtual void activemq::commands::Message::beforeMarshal (wireformat::WireFormat *wireFormat *AMQCPP_UNUSED*) throw (decaf::io::IOException) [virtual]

Handles the marshaling of the objects properties into the internal byte array before the object is marshaled to the wire.

Parameters:

wireFormat - the wireformat controller

Reimplemented from **activemq::commands::BaseDataStructure** (p. 716).

6.434.2.3 virtual Message* activemq::commands::Message::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 173), **activemq::commands::ActiveMQBytesMessage** (p. 200), **activemq::commands::ActiveMQMapMessage** (p. 312), **activemq::commands::ActiveMQMessage** (p. 343), **activemq::commands::ActiveMQObjectMessage** (p. 384), **activemq::commands::ActiveMQStreamMessage** (p. 467), and **activemq::commands::ActiveMQTextMessage** (p. 575).

6.434.2.4 virtual void activemq::commands::Message::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 173), **activemq::commands::ActiveMQBytesMessage** (p. 201), **activemq::commands::ActiveMQMapMessage** (p. 312), **activemq::commands::ActiveMQMessage** (p. 343), **activemq::commands::ActiveMQObjectMessage** (p. 384), **activemq::commands::ActiveMQStreamMessage** (p. 467), and **activemq::commands::ActiveMQTextMessage** (p. 575).

6.434.2.5 virtual bool activemq::commands::Message::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 174), **activemq::commands::ActiveMQBytesMessage** (p. 201), **activemq::commands::ActiveMQMapMessage** (p. 312), **activemq::commands::ActiveMQMessage** (p. 343), **activemq::commands::ActiveMQMessageTemplate< T >** (p. 369), **activemq::commands::ActiveMQObjectMessage** (p. 384), **activemq::commands::ActiveMQStreamMessage** (p. 468), **activemq::commands::ActiveMQTextMessage** (p. 575), **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 369), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 369), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 369), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 369), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 369), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 369).

6.434.2.6 virtual Pointer<core::ActiveMQAckHandler> activemq::commands::Message::getAckHandler () const [inline, virtual]

Gets the Acknowledgment Handler that this **Message** (p. 2145) will use when the Acknowledge method is called.

Returns:

handler ActiveMQAckHandler to call or NULL if not set

6.434.2.7 virtual long long activemq::commands::Message::getArrival () const [virtual]

6.434.2.8 virtual long long activemq::commands::Message::getBrokerInTime () const [virtual]

6.434.2.9 virtual long long activemq::commands::Message::getBrokerOutTime () const [virtual]

6.434.2.10 virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::Message::getBrokerPath () [virtual]

6.434.2.11 virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::Message::getBrokerPath () const [virtual]

6.434.2.12 virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::Message::getCluster () [virtual]

6.434.2.13 virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::Message::getCluster () const [virtual]

6.434.2.14 virtual std::vector<unsigned char>& activemq::commands::Message::getContent () [virtual]

6.434.2.15 virtual const std::vector<unsigned char>& activemq::commands::Message::getContent () const [virtual]

6.434.2.16 virtual std::string& activemq::commands::Message::getCorrelationId () [virtual]

6.434.2.17 virtual const std::string& activemq::commands::Message::getCorrelationId () const [virtual]

6.434.2.18 virtual Pointer<DataStructure>& activemq::commands::Message::getDataStructure () [virtual]

6.434.2.19 virtual const Pointer<DataStructure>& activemq::commands::Message::getDataStructure () const [virtual]

6.434.2.20 virtual unsigned char activemq::commands::Message::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 174), **activemq::commands::ActiveMQBytesMessage** (p. 202), **activemq::commands::ActiveMQMapMessage** (p. 314), **activemq::commands::ActiveMQMessage** (p. 343), **activemq::commands::ActiveMQObjectMessage** (p. 385), **activemq::commands::ActiveMQStreamMessage** (p. 468), and **activemq::commands::ActiveMQTextMessage** (p. 575).

6.434.2.21 virtual Pointer<ActiveMQDestination>& activemq::commands::Message::getDestination () [virtual]

6.434.2.22 virtual const Pointer<ActiveMQDestination>& activemq::commands::Message::getDestination () const [virtual]

6.434.2.23 virtual long long activemq::commands::Message::getExpiration () const [virtual]

6.434.2.24 virtual std::string& activemq::commands::Message::getGroupID () [virtual]

6.434.2.25 virtual const std::string& activemq::commands::Message::getGroupID () const [virtual]

6.434.2.26 virtual int activemq::commands::Message::getGroupSequence () const [virtual]

6.434.2.27 virtual std::vector<unsigned char>& activemq::commands::Message::getMarshalledProperties () [virtual]

6.434.2.28 virtual const std::vector<unsigned char>& activemq::commands::Message::getMarshalledProperties () const [virtual]

6.434.2.29 virtual Pointer<MessageId>& activemq::commands::Message::getMessageId () [virtual]

6.434.2.30 virtual const Pointer<MessageId>& activemq::commands::Message::getMessageId () const [virtual]

6.434.2.31 const util::PrimitiveMap& activemq::commands::Message::getMessageProperties () const [inline]

6.434.2.32 util::PrimitiveMap& activemq::commands::Message::getMessageProperties () [inline]

Gets a reference to the Message's Properties object, allows the derived classes to get and set their own specific properties.

Returns:

a reference to the Primitive Map that holds message properties.

6.434.2.33 virtual Pointer<ActiveMQDestination>& activemq::commands::Message::getOriginalDestination () [virtual]

6.434.2.34 virtual const Pointer<ActiveMQDestination>& activemq::commands::Message::getOriginalDestination () const [virtual]

6.434.2.35 virtual Pointer<TransactionId>& activemq::commands::Message::getOriginalTransactionId () [virtual]

6.434.2.36 virtual const Pointer<TransactionId>& activemq::commands::Message::getOriginalTransactionId () const [virtual]

6.434.2.37 virtual unsigned char activemq::commands::Message::getPriority () const [virtual]

6.434.2.38 virtual Pointer<ProducerId>& activemq::commands::Message::getProducerId () [virtual]

6.434.2.39 virtual const Pointer<ProducerId>& activemq::commands::Message::getProducerId () const [virtual]

6.434.2.40 virtual int activemq::commands::Message::getRedeliveryCounter () const [virtual]

6.434.2.41 virtual Pointer<ActiveMQDestination>& activemq::commands::Message::getReplyTo () [virtual]

6.434.2.42 virtual const Pointer<ActiveMQDestination>& activemq::commands::Message::getReplyTo () const [virtual]

6.434.2.43 virtual unsigned int activemq::commands::Message::getSize () const [virtual]

Returns the Size of this message in Bytes.

Returns:

number of bytes this message equates to.

Reimplemented in **activemq::commands::ActiveMQTextMessage** (p. 576).

6.434.2.44 virtual Pointer<ConsumerId>& activemq::commands::Message::getTargetConsumerId () [virtual]

6.434.2.45 virtual const Pointer<ConsumerId>& activemq::commands::Message::getTargetConsumerId () const [virtual]

6.434.2.46 virtual long long activemq::commands::Message::getTimestamp () const [virtual]

6.434.2.47 virtual Pointer<TransactionId>& activemq::commands::Message::getTransactionId () [virtual]

6.434.2.48 virtual const Pointer<TransactionId>& activemq::commands::Message::getTransactionId () const [virtual]

6.434.2.49 virtual std::string& activemq::commands::Message::getType () [virtual]

6.434.2.50 virtual const std::string& activemq::commands::Message::getType () const [virtual]

6.434.2.51 virtual std::string& activemq::commands::Message::getUserID () [virtual]

6.434.2.52 virtual const std::string& activemq::commands::Message::getUserID () const [virtual]

6.434.2.53 virtual bool activemq::commands::Message::isCompressed () const [virtual]

6.434.2.54 virtual bool activemq::commands::Message::isDroppable () const [virtual]

6.434.2.55 virtual bool activemq::commands::Message::isExpired () const [virtual]

Returns if this message has expired, meaning that its Expiration time has elapsed.

Returns:

true if message is expired.

6.434.2.56 virtual bool activemq::commands::Message::isMarshalAware () const [inline, virtual]

Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.

Returns:

boolean indicating desire to be in marshaling stages

Reimplemented from **activemq::commands::BaseDataStructure** (p. 717).

Reimplemented in **activemq::commands::ActiveMQMapMessage** (p. 316).

6.434.2.57 virtual bool activemq::commands::Message::isMessage () const [inline, virtual]

Returns:

an answer of true to the **isMessage()** (p. 2156) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 653).

6.434.2.58 virtual bool activemq::commands::Message::isPersistent () const [virtual]

6.434.2.59 bool activemq::commands::Message::isReadOnlyBody () const [inline]

Returns if the **Message** (p. 2145) Body is Read Only.

Returns:

true if **Message** (p. 2145) Content is Read Only.

6.434.2.60 bool activemq::commands::Message::isReadOnlyProperties () const [inline]

Returns if the **Message** (p. 2145) Properties Are Read Only.

Returns:

true if **Message** (p. 2145) Properties are Read Only.

6.434.2.61 virtual bool activemq::commands::Message::isRecievedByDFBridge () const [virtual]

6.434.2.62 virtual void activemq::commands::Message::onSend () [inline, virtual]

Allows derived **Message** (p. 2145) classes to perform tasks before a message is sent.

Reimplemented in **activemq::commands::ActiveMQBytesMessage** (p. 202), **activemq::commands::ActiveMQMessageTemplate< T >** (p. 376), **activemq::commands::ActiveMQStreamMessage** (p. 468), **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 376), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 376), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 376), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 376), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 376), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 376).

6.434.2.63 Message& activemq::commands::Message::operator= (const Message &) [inline, protected]

6.434.2.64 virtual void activemq::commands::Message::setAckHandler (const Pointer< core::ActiveMQAckHandler > & *handler*) [inline, virtual]

Sets the Acknowledgment Handler that this **Message** (p. 2145) will use when the Acknowledge method is called.

Parameters:

handler ActiveMQAckHandler to call

6.434.2.65 virtual void activemq::commands::Message::setArrival (long long *arrival*) [virtual]

6.434.2.66 virtual void activemq::commands::Message::setBrokerInTime (long long *brokerInTime*) [virtual]

6.434.2.67 virtual void activemq::commands::Message::setBrokerOutTime (long long *brokerOutTime*) [virtual]

6.434.2.68 virtual void activemq::commands::Message::setBrokerPath (const std::vector< decaf::lang::Pointer< BrokerId > > & *brokerPath*) [virtual]

6.434.2.69 virtual void activemq::commands::Message::setCluster (const std::vector< decaf::lang::Pointer< BrokerId > > & *cluster*) [virtual]

6.434.2.70 virtual void activemq::commands::Message::setCompressed (bool *compressed*) [virtual]

6.434.2.71 virtual void activemq::commands::Message::setContent (const std::vector< unsigned char > & *content*) [virtual]

6.434.2.72 virtual void activemq::commands::Message::setCorrelationId (const std::string & *correlationId*) [virtual]

6.434.2.73 virtual void activemq::commands::Message::setDataStructure (const Pointer< DataStructure > & *dataStructure*) [virtual]

6.434.2.74 virtual void activemq::commands::Message::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.434.2.75 virtual void activemq::commands::Message::setDroppable (bool *droppable*) [virtual]

6.434.2.76 virtual void activemq::commands::Message::setExpiration (long long *expiration*) [virtual]

6.434.2.77 virtual void activemq::commands::Message::setGroupID (const std::string & *groupID*) [virtual]

6.434.2.78 virtual void activemq::commands::Message::setGroupSequence (int *groupSequence*) [virtual]

6.434.2.79 virtual void activemq::commands::Message::setMarshalledProperties (const std::vector< unsigned char > & *marshalledProperties*) [virtual]

6.434.2.80 virtual void activemq::commands::Message::setMessageId (const Pointer< MessageId > & *messageId*) [virtual]

6.434.2.81 virtual void activemq::commands::Message::setOriginalDestination (const Pointer< ActiveMQDestination > & *originalDestination*) [virtual]

6.434.2.82 virtual void activemq::commands::Message::setOriginalTransactionId (const Pointer< TransactionId > & *originalTransactionId*) [virtual]

6.434.2.83 virtual void activemq::commands::Message::setPersistent (bool *persistent*) [virtual]

6.434.2.84 virtual void activemq::commands::Message::setPriority (unsigned char *priority*) [virtual]

Parameters:

value - true if Content should be read only.

6.434.2.87 void activemq::commands::Message::setReadOnlyProperties (bool *value*) [inline]

Set the Read Only State of the **Message** (p. 2145) Properties.

Parameters:

value - true if Properties should be read only.

6.434.2.88 virtual void activemq::commands::Message::setRecievedByDFBridge (bool *recievedByDFBridge*) [virtual]

6.434.2.89 virtual void activemq::commands::Message::setRedeliveryCounter (int *redeliveryCounter*) [virtual]

6.434.2.90 virtual void activemq::commands::Message::setReplyTo (const Pointer< ActiveMQDestination > & *replyTo*) [virtual]

6.434.2.91 virtual void activemq::commands::Message::setTargetConsumerId (const Pointer< ConsumerId > & *targetConsumerId*) [virtual]

6.434.2.92 virtual void activemq::commands::Message::setTimestamp (long long *timestamp*) [virtual]

6.434.2.93 virtual void activemq::commands::Message::setTransactionId (const Pointer< TransactionId > & *transactionId*) [virtual]

6.434.2.94 virtual void activemq::commands::Message::setType (const std::string & *type*) [virtual]

6.434.2.95 virtual void activemq::commands::Message::setUserID (const std::string & *userID*) [virtual]

6.434.2.96 virtual std::string activemq::commands::Message::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 655).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 176), **activemq::commands::ActiveMQBytesMessage** (p. 208), **activemq::commands::ActiveMQMapMessage** (p. 320), **activemq::commands::ActiveMQMessage** (p. 344), **activemq::commands::ActiveMQObjectMessage** (p. 385), **activemq::commands::ActiveMQStreamMessage** (p. 474), and **activemq::commands::ActiveMQTextMessage** (p. 577).

6.434.2.97 virtual Pointer<Command> activemq::commands::Message::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1067).

6.435 cms::Message Class Reference

Root of all messages.

`#include <src/main/cms/Message.h>`Inheritance diagram for cms::Message:

Public Member Functions

- virtual ~**Message** ()
- virtual **Message** * **clone** () const =0

  Clone this message exactly, returns a new instance that the caller is required to delete.

- virtual void **acknowledge** () const =0 throw (IllegalStateException, CMSException)

  Acknowledges all consumed messages of the session of this consumed message.

- virtual void **clearBody** ()=0 throw (CMSException)

  Clears out the body of the message.

- virtual void **clearProperties** ()=0 throw (CMSException)

  Clears out the message body.

- virtual std::vector< std::string > **getPropertyNames** () const =0 throw (CMSException)

  Retrieves the property names.

- virtual bool **propertyExists** (const std::string &name) const =0 throw (CMSException)

  Indicates whether or not a given property exists.

- virtual bool **getBooleanProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSException)

  Gets a boolean property.

- virtual unsigned char **getByteProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSException)

  Gets a byte property.

- virtual double **getDoubleProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSException)

  Gets a double property.

- virtual float **getFloatProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSException)

  Gets a float property.

- virtual int **getIntProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSException)

  Gets a int property.

- virtual long long **getLongProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSException)

  Gets a long property.

- virtual short **getShortProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSException)

  Gets a short property.

- virtual std::string **getStringProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSException)

  Gets a string property.

- virtual void **setBooleanProperty** (const std::string &name, bool value)=0 throw (MessageNotWriteableException, CMSException)

  Sets a boolean property.

- virtual void **setByteProperty** (const std::string &name, unsigned char value)=0 throw (MessageNotWriteableException, CMSException)

  Sets a byte property.

- virtual void **setDoubleProperty** (const std::string &name, double value)=0 throw (MessageNotWriteableException, CMSException)

  Sets a double property.

- virtual void **setFloatProperty** (const std::string &name, float value)=0 throw (MessageNotWriteableException, CMSException)

  Sets a float property.

- virtual void **setIntProperty** (const std::string &name, int value)=0 throw (MessageNotWriteableException, CMSException)

  Sets a int property.

- virtual void **setLongProperty** (const std::string &name, long long value)=0 throw (MessageNotWriteableException, CMSException)

  Sets a long property.

- virtual void **setShortProperty** (const std::string &name, short value)=0 throw (MessageNotWriteableException, CMSException)

  Sets a short property.

- virtual void **setStringProperty** (const std::string &name, const std::string &value)=0 throw (MessageNotWriteableException, CMSException)

  Sets a string property.

- virtual std::string **getCMSCorrelationID** () const =0 throw (CMSException)

  Gets the correlation ID for the message.

- virtual void **setCMSCorrelationID** (const std::string &correlationId)=0 throw (CMSException)

  Sets the correlation ID for the message.

- virtual int **getCMSDeliveryMode** () const =0 throw (CMSException)

  *Gets the **DeliveryMode** (p. 1478) for this message.*

- virtual void **setCMSDeliveryMode** (int mode)=0 throw (CMSException)

  *Sets the **DeliveryMode** (p. 1478) for this message.*

- virtual const **Destination** * **getCMSDestination** () const =0 throw (CMSException)

  *Gets the **Destination** (p. 1480) object for this message.*

- virtual void **setCMSDestination** (const **Destination** *destination)=0 throw (CMSException)

  *Sets the **Destination** (p. 1480) object for this message.*

- virtual long long **getCMSExpiration** () const =0 throw (CMSException)

  Gets the message's expiration value.

- virtual void **setCMSExpiration** (long long expireTime)=0 throw (CMSException)

  Sets the message's expiration value.

- virtual std::string **getCMSMessageID** () const =0 throw (CMSException)

  The CMSMessageID header field contains a value that uniquely identifies each message sent by a provider.

- virtual void **setCMSMessageID** (const std::string &id)=0 throw (CMSException)

  Sets the message ID.

- virtual int **getCMSPriority** () const =0 throw (CMSException)

  Gets the message priority level.

- virtual void **setCMSPriority** (int priority)=0 throw (CMSException)

  Sets the Priority Value for this message.

- virtual bool **getCMSRedelivered** () const =0 throw (CMSException)

  Gets an indication of whether this message is being redelivered.

- virtual void **setCMSRedelivered** (bool redelivered)=0 throw (CMSException)

  Specifies whether this message is being redelivered.

- virtual const **cms::Destination** * **getCMSReplyTo** () const =0 throw (CMSException)

  *Gets the **Destination** (p. 1480) object to which a reply to this message should be sent.*

- virtual void **setCMSReplyTo** (const **cms::Destination** *destination)=0 throw (CMSException)

  *Sets the **Destination** (p. 1480) object to which a reply to this message should be sent.*

- virtual long long **getCMSTimestamp** () const =0 throw (CMSException)

  Gets the message timestamp.

- virtual void **setCMSTimestamp** (long long timeStamp)=0 throw (CMSException)

Sets the message timestamp.

- virtual std::string **getCMSType** () const =0 throw (CMSException)

  Gets the message type identifier supplied by the client when the message was sent.

- virtual void **setCMSType** (const std::string &type)=0 throw (CMSException)

  Sets the message type.

6.435.1 Detailed Description

Root of all messages. As in JMS, a message is comprised of 3 parts: CMS-specific headers, user-defined properties, and the body.

Message (p. 2163) Bodies

The CMS API defines four types of message bodies, each type is contained within its own **Message** (p. 2163) Interface definition.

- Stream - A **StreamMessage** (p. 3081) object's message body contains a stream of primitive values in the C++ language. It is filled and read sequentially. Unlike the **BytesMessage** (p. 938) type the values written to a **StreamMessage** (p. 3081) retain information on their type and rules for type conversion are enforced when reading back the values from the **Message** (p. 2163) Body.
- Map - A **MapMessage** (p. 2106) object's message body contains a set of name-value pairs, where names are std::string objects, and values are C++ primitives. The entries can be accessed sequentially or randomly by name. The **MapMessage** (p. 2106) makes no garuntee on the order of the elements within the **Message** (p. 2163) body.
- Text - A **TextMessage** (p. 3170) object's message body contains a std::string object. This message type can be used to transport plain-text messages, and XML messages.
- Bytes - A **BytesMessage** (p. 938) object's message body contains a stream of uninterpreted bytes. This message type is for literally encoding a body to match an existing message format. In many cases, it is possible to use one of the other body types, which are easier to use.

Message (p. 2163) Properties

Message (p. 2163) properties support the following conversion table. The marked cases must be supported. The unmarked cases must throw a **CMSException** (p. 1031). The String-to-primitive conversions may throw a runtime exception if the primitive's valueOf method does not accept the String as a valid representation of the primitive.

A value written as the row type can be read as the column type.

	boolean	byte	short	int	long	float	double	String
boolean	X							X
byte		X	X	X	X			X
short			X	X	X			X
int				X	X			X
long					X			X
float						X	X	X
double							X	X
String	X	X	X	X	X	X	X	X

|----------

When a **Message** (p. 2163) is delivered its properties are considered to be in a read-only mode and cannot be changed. Attempting to change the value of a delivered Message's properties will result in a **CMSException** (p. 1031) being thrown.

6.435.2 Constructor & Destructor Documentation

6.435.2.1 virtual cms::Message::~Message () [inline, virtual]

6.435.3 Member Function Documentation

6.435.3.1 virtual void cms::Message::acknowledge () const throw (IllegalStateException, CMSException) [pure virtual]

Acknowledges all consumed messages of the session of this consumed message. All consumed CMS messages support the acknowledge method for use when a client has specified that its CMS session's consumed messages are to be explicitly acknowledged. By invoking acknowledge on a consumed message, a client acknowledges all messages consumed by the session that the message was delivered to.

Calls to acknowledge are ignored for both transacted sessions and sessions specified to use implicit acknowledgment modes.

A client may individually acknowledge each message as it is consumed, or it may choose to acknowledge messages as an application-defined group (which is done by calling acknowledge on the last received message of the group, thereby acknowledging all messages consumed by the session.)

Messages that have been received but not acknowledged may be redelivered.

Exceptions:

CMSException (p. ***1031***) - if an internal error occurs.
IllegalStateException (p. ***1729***) - if this method is called on a closed session.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 368), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 368), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 368), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 368), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 368), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 368).

6.435.3.2 virtual void cms::Message::clearBody () throw (CMSException) [pure virtual]

Clears out the body of the message. This does not clear the headers or properties.

Exceptions:

CMSException *(*p. ***1031***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 200), **activemq::commands::ActiveMQMapMessage** (p. 311), **activemq::commands::ActiveMQStreamMessage** (p. 467), **activemq::commands::ActiveMQTextMessage** (p. 574), **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 368), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 368), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 368), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 368), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 368), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 368).

6.435.3.3 virtual void cms::Message::clearProperties () throw (CMSException) [pure virtual]

Clears out the message body. Clearing a message's body does not clear its header values or property entries.

If this message body was read-only, calling this method leaves the message body in the same state as an empty body in a newly created message.

Exceptions:

CMSException *(*p. ***1031***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 369), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 369), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 369), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 369), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 369), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 369).

6.435.3.4 virtual Message* cms::Message::clone () const [pure virtual]

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns:

new copy of this message

Implemented in **activemq::commands::ActiveMQBlobMessage** (p. 173), **activemq::commands::ActiveMQBytesMessage** (p. 200), **activemq::commands::ActiveMQMapMessage** (p. 311), **activemq::commands::ActiveMQMessage** (p. 342), **activemq::commands::ActiveMQObjectMessage** (p. 384), **activemq::commands::ActiveMQStreamMessage** (p. 467), **activemq::commands::ActiveMQTextMessage** (p. 574), and **cms::BytesMessage** (p. 941).

6.435.3.5 virtual bool cms::Message::getBooleanProperty (const std::string & *name*) const throw (MessageFormatException, CMSException) [pure virtual]

Gets a boolean property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSException *(*p. ***1031****)* if the property does not exist.

MessageFormatException *(*p. ***2278****)* - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 369), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 369), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 369), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 369), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 369), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 369).

6.435.3.6 virtual unsigned char cms::Message::getByteProperty (const std::string & *name*) const throw (MessageFormatException, CMSException) [pure virtual]

Gets a byte property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSException *(*p. ***1031****)* if the property does not exist.

MessageFormatException *(*p. ***2278****)* - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 370), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 370), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 370), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 370), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 370), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 370).

6.435.3.7 virtual std::string cms::Message::getCMSCorrelationID () const throw (CMSException) [pure virtual]

Gets the correlation ID for the message. This method is used to return correlation ID values that are either provider-specific message IDs or application-specific String values.

Returns:

string representation of the correlation Id

Exceptions:

CMSException (p. ***1031***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 370), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 370), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 370), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 370), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 370), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 370).

6.435.3.8 virtual int cms::Message::getCMSDeliveryMode () const throw (CMSException) [pure virtual]

Gets the **DeliveryMode** (p. 1478) for this message.

Returns:

DeliveryMode (p. 1478) enumerated value.

Exceptions:

CMSException (p. ***1031***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 370), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 370), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 370), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 370), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 370), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 370).

6.435.3.9 virtual const Destination* cms::Message::getCMSDestination () const throw (CMSException) [pure virtual]

Gets the **Destination** (p. 1480) object for this message. The CMSDestination header field contains the destination to which the message is being sent.

When a message is sent, this field is ignored. After completion of the send or publish method, the field holds the destination specified by the method.

When a message is received, its CMSDestination value must be equivalent to the value assigned when it was sent.

Returns:

Destination (p. 1480) object

Exceptions:

CMSException *(p. **1031**)* - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 371), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 371), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 371), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 371), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 371), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 371).

6.435.3.10 virtual long long cms::Message::getCMSExpiration () const throw (CMSException) [pure virtual]

Gets the message's expiration value. When a message is sent, the CMSExpiration header field is left unassigned. After completion of the send or publish method, it holds the expiration time of the message. This is the sum of the time-to-live value specified by the client and the GMT at the time of the send or publish.

If the time-to-live is specified as zero, CMSExpiration is set to zero to indicate that the message does not expire.

When a message's expiration time is reached, a provider should discard it. The CMS API does not define any form of notification of message expiration.

Clients should not receive messages that have expired; however, the CMS API does not guarantee that this will not happen.

Returns:

the time the message expires, which is the sum of the time-to-live value specified by the client and the GMT at the time of the send

Exceptions:

CMSException *(p. **1031**)* - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 371), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 371), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 371), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 371), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 371), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 371).

6.435.3.11 virtual std::string cms::Message::getCMSMessageID () const throw (CMSException) [pure virtual]

The CMSMessageID header field contains a value that uniquely identifies each message sent by a provider. When a message is sent, CMSMessageID can be ignored. When the send or publish method returns, it contains a provider-assigned value.

A CMSMessageID is a String value that should function as a unique key for identifying messages in a historical repository. The exact scope of uniqueness is provider-defined. It should at least cover all messages for a specific installation of a provider, where an installation is some connected set of message routers.

All CMSMessageID values must start with the prefix 'ID:'. Uniqueness of message ID values across different providers is not required.

Since message IDs take some effort to create and increase a message's size, some CMS providers may be able to optimize message overhead if they are given a hint that the message ID is not used by an application. By calling the **MessageProducer.setDisableMessageID** (p. 2337) method, a CMS client enables this potential optimization for all messages sent by that message producer. If the CMS provider accepts this hint, these messages must have the message ID set to null; if the provider ignores the hint, the message ID must be set to its normal unique value.

Returns:

provider-assigned message id

Exceptions:

CMSException *(*p. ***1031)*** - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 371), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 371), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 371), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 371), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 371), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 371).

6.435.3.12 virtual int cms::Message::getCMSPriority () const throw (CMSException) [pure virtual]

Gets the message priority level. The CMS API defines ten levels of priority value, with 0 as the lowest priority and 9 as the highest. In addition, clients should consider priorities 0-4 as gradations of normal priority and priorities 5-9 as gradations of expedited priority.

The CMS API does not require that a provider strictly implement priority ordering of messages; however, it should do its best to deliver expedited messages ahead of normal messages.

Returns:

priority value

Exceptions:

CMSException *(*p. ***1031)*** - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 372), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 372), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 372), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 372), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 372), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 372).

6.435.3.13 virtual bool cms::Message::getCMSRedelivered () const throw (CMSException) [pure virtual]

Gets an indication of whether this message is being redelivered. If a client receives a message with the CMSRedelivered field set, it is likely, but not guaranteed, that this message was delivered earlier but that its receipt was not acknowledged at that time.

Returns:

true if this message is being redelivered

Exceptions:

CMSException (p. ***1031***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 372), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 372), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 372), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 372), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 372), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 372).

6.435.3.14 virtual const cms::Destination* cms::Message::getCMSReplyTo () const throw (CMSException) [pure virtual]

Gets the **Destination** (p. 1480) object to which a reply to this message should be sent.

Returns:

Destination (p. 1480) to which to send a response to this message

Exceptions:

CMSException (p. ***1031***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 372), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 372), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 372), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 372), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 372), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 372).

6.435.3.15 virtual long long cms::Message::getCMSTimestamp () const throw (CMSException) [pure virtual]

Gets the message timestamp. The CMSTimestamp header field contains the time a message was handed off to a provider to be sent. It is not the time the message was actually transmitted, because the actual send may occur later due to transactions or other client-side queuing of messages.

When a message is sent, CMSTimestamp is ignored. When the send or publish method returns, it contains a time value somewhere in the interval between the call and the return. The value is in the format of a normal millis time value in the Java programming language.

Since timestamps take some effort to create and increase a message's size, some CMS providers may be able to optimize message overhead if they are given a hint that the timestamp is not used by an application. By calling the MessageProducer.setDisableMessageTimestamp method, a CMS client enables this potential optimization for all messages sent by that message producer. If the CMS provider accepts this hint, these messages must have the timestamp set to zero; if the provider ignores the hint, the timestamp must be set to its normal value.

Returns:

the message timestamp

Exceptions:

CMSException *(*p. ***1031)*** - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 372), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 372), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 372), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 372), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 372), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 372).

6.435.3.16 virtual std::string cms::Message::getCMSType () const throw (CMSException) [pure virtual]

Gets the message type identifier supplied by the client when the message was sent.

Returns:

the message type

See also:

setCMSType (p. 2183)

Exceptions:

CMSException *(*p. ***1031)*** - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 373), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 373), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 373), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 373), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 373), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 373).

6.435.3.17 virtual double cms::Message::getDoubleProperty (const std::string & *name*) const throw (MessageFormatException, CMSException) [pure virtual]

Gets a double property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSException *(*p. ***1031***) if the property does not exist.

MessageFormatException *(*p. ***2278***) - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 373), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 373), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 373), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 373), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 373), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 373).

6.435.3.18 virtual float cms::Message::getFloatProperty (const std::string & *name*) const throw (MessageFormatException, CMSException) [pure virtual]

Gets a float property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSException *(*p. ***1031***) if the property does not exist.

MessageFormatException *(*p. ***2278***) - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 373), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 373), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 373), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 373), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 373), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 373).

6.435.3.19 virtual int cms::Message::getIntProperty (const std::string & *name*) const throw (MessageFormatException, CMSException) [pure virtual]

Gets a int property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSException *(*p. ***1031****)* if the property does not exist.

MessageFormatException *(*p. ***2278****)* - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 374), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 374), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 374), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 374), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 374), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 374).

6.435.3.20 virtual long long cms::Message::getLongProperty (const std::string & *name*) const throw (MessageFormatException, CMSException) [pure virtual]

Gets a long property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSException *(*p. ***1031****)* if the property does not exist.

MessageFormatException *(*p. ***2278****)* - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 374), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 374), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 374), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 374), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 374), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 374).

6.435.3.21 virtual std::vector<std::string> cms::Message::getPropertyNames () const throw (CMSException) [pure virtual]

Retrieves the property names.

Returns:

The complete set of property names currently in this message.

Exceptions:

CMSException *(*p. ***1031****)* - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** **>** (p. 375), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** **>** (p. 375), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** **>** (p. 375), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** **>** (p. 375), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** **>** (p. 375), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** **>** (p. 375).

6.435.3.22 virtual short cms::Message::getShortProperty (const std::string & *name*) const throw (MessageFormatException, CMSException) [pure virtual]

Gets a short property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSException *(*p. ***1031****)* if the property does not exist.

MessageFormatException *(*p. ***2278****)* - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** **>** (p. 375), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** **>** (p. 375), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** **>** (p. 375), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** **>** (p. 375), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** **>** (p. 375), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** **>** (p. 375).

6.435.3.23 virtual std::string cms::Message::getStringProperty (const std::string & *name*) const throw (MessageFormatException, CMSException) [pure virtual]

Gets a string property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

Exceptions:

CMSException *(*p. ***1031****)* if the property does not exist.

MessageFormatException *(*p. ***2278)*** - if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage>** (p. 375), **activemq::commands::ActiveMQMessageTemplate<cms::MapMessage>** (p. 375), **activemq::commands::ActiveMQMessageTemplate<cms::Message>** (p. 375), **activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage>** (p. 375), **activemq::commands::ActiveMQMessageTemplate<cms::TextMessage>** (p. 375), and **activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage>** (p. 375).

6.435.3.24 virtual bool cms::Message::propertyExists (const std::string & *name*) const throw (CMSException) [pure virtual]

Indicates whether or not a given property exists.

Parameters:

name The name of the property to look up.

Returns:

True if the property exists in this message.

Exceptions:

CMSException *(*p. ***1031)*** - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage>** (p. 376), **activemq::commands::ActiveMQMessageTemplate<cms::MapMessage>** (p. 376), **activemq::commands::ActiveMQMessageTemplate<cms::Message>** (p. 376), **activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage>** (p. 376), **activemq::commands::ActiveMQMessageTemplate<cms::TextMessage>** (p. 376), and **activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage>** (p. 376).

6.435.3.25 virtual void cms::Message::setBooleanProperty (const std::string & *name*, bool *value*) throw (MessageNotWriteableException, CMSException) [pure virtual]

Sets a boolean property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException *(*p. ***1031)*** - if the name is an empty string.

MessageNotWriteableException *(*p. ***2331)*** - if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage>** (p. 376), **activemq::commands::ActiveMQMessageTemplate<**

cms::MapMessage > (p. 376), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 376), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 376), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 376), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 376).

6.435.3.26 virtual void cms::Message::setByteProperty (const std::string & *name*, unsigned char *value*) throw (MessageNotWriteableException, CMSException) [pure virtual]

Sets a byte property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException *(*p. ***1031****)* - if the name is an empty string.

MessageNotWriteableException *(*p. ***2331****)* - if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 376), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 376), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 376), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 376), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 376), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 376).

6.435.3.27 virtual void cms::Message::setCMSCorrelationID (const std::string & *correlationId*) throw (CMSException) [pure virtual]

Sets the correlation ID for the message. A client can use the CMSCorrelationID header field to link one message with another. A typical use is to link a response message with its request message.

CMSCorrelationID can hold one of the following:

- A provider-specific message ID
- An application-specific String
- A provider-native byte[] value

Since each message sent by a CMS provider is assigned a message ID value, it is convenient to link messages via message ID. All message ID values must start with the 'ID:' prefix.

In some cases, an application (made up of several clients) needs to use an application-specific value for linking messages. For instance, an application may use CMSCorrelationID to hold a value referencing some external information. Application-specified values must not start with the 'ID:' prefix; this is reserved for provider-generated message ID values.

If a provider supports the native concept of correlation ID, a CMS client may need to assign specific CMSCorrelationID values to match those expected by clients that do not use the CMS API. A byte[] value is used for this purpose. CMS providers without native correlation ID values are not required to support byte[] values. The use of a byte[] value for CMSCorrelationID is non-portable.

Parameters:

correlationId The message ID of a message being referred to.

Exceptions:

CMSException *(*p. ***1031***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 377), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 377), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 377), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 377), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 377), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 377).

6.435.3.28 virtual void cms::Message::setCMSDeliveryMode (int *mode*) throw (CMSException) [pure virtual]

Sets the **DeliveryMode** (p. 1478) for this message. CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters:

mode **DeliveryMode** (p. 1478) enumerated value.

Exceptions:

CMSException *(*p. ***1031***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 377), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 377), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 377), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 377), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 377), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 377).

6.435.3.29 virtual void cms::Message::setCMSDestination (const Destination * *destination*) throw (CMSException) [pure virtual]

Sets the **Destination** (p. 1480) object for this message. CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters:

destination **Destination** (p. 1480) Object

Exceptions:

CMSException *(*p. ***1031***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 377), **activemq::commands::ActiveMQMessageTemplate<**

cms::MapMessage > (p. 377), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 377), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 377), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 377), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 377).

6.435.3.30 virtual void cms::Message::setCMSExpiration (long long *expireTime*) throw (CMSException) [pure virtual]

Sets the message's expiration value. CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters:

expireTime the message's expiration time

Exceptions:

CMSException (p. ***1031***) - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 378), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 378), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 378), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 378), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 378), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 378).

6.435.3.31 virtual void cms::Message::setCMSMessageID (const std::string & *id*) throw (CMSException) [pure virtual]

Sets the message ID. CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters:

id the ID of the message

Exceptions:

CMSException (p. ***1031***) - if an internal error occurs.

6.435.3.32 virtual void cms::Message::setCMSPriority (int *priority*) throw (CMSException) [pure virtual]

Sets the Priority Value for this message. CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters:

priority priority value for this message

Exceptions:

CMSException *(*p. ***1031)*** - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 378), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 378), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 378), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 378), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 378), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 378).

6.435.3.33 virtual void cms::Message::setCMSRedelivered (bool *redelivered*) throw (CMSException) [pure virtual]

Specifies whether this message is being redelivered. This field is set at the time the message is delivered. This method can be used to change the value for a message that has been received.

Parameters:

redelivered boolean redelivered value

Exceptions:

CMSException *(*p. ***1031)*** - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 378), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 378), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 378), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 378), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 378), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 378).

6.435.3.34 virtual void cms::Message::setCMSReplyTo (const cms::Destination * *destination*) throw (CMSException) [pure virtual]

Sets the **Destination** (p. 1480) object to which a reply to this message should be sent. The CMSReplyTo header field contains the destination where a reply to the current message should be sent. If it is null, no reply is expected. The destination may be either a **Queue** (p. 2674) object or a **Topic** (p. 3215) object.

Messages sent with a null CMSReplyTo value may be a notification of some event, or they may just be some data the sender thinks is of interest.

Messages with a CMSReplyTo value typically expect a response. A response is optional; it is up to the client to decide. These messages are called requests. A message sent in response to a request is called a reply.

In some cases a client may wish to match a request it sent earlier with a reply it has just received. The client can use the CMSCorrelationID header field for this purpose.

Parameters:

destination **Destination** (p. 1480) to which to send a response to this message

Exceptions:

CMSException *(*p. ***1031)*** - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 379), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 379).

6.435.3.35 virtual void cms::Message::setCMSTimestamp (long long *timeStamp*) throw (CMSException) [pure virtual]

Sets the message timestamp. CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters:

timeStamp integer time stamp value

Exceptions:

CMSException *(*p. ***1031)*** - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 379), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 379), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 379).

6.435.3.36 virtual void cms::Message::setCMSType (const std::string & *type*) throw (CMSException) [pure virtual]

Sets the message type. Some CMS providers use a message repository that contains the definitions of messages sent by applications. The CMSType header field may reference a message's definition in the provider's repository.

The CMS API does not define a standard message definition repository, nor does it define a naming policy for the definitions it contains.

Some messaging systems require that a message type definition for each application message be created and that each message specify its type. In order to work with such CMS providers, CMS clients should assign a value to CMSType, whether the application makes use of it or not. This ensures that the field is properly set for those providers that require it.

To ensure portability, CMS clients should use symbolic values for CMSType that can be configured at installation time to the values defined in the current provider's message repository. If string literals are used, they may not be valid type names for some CMS providers.

Parameters:

type the message type

See also:

getCMSType (p. 2174)

Exceptions:

CMSException *(p. **1031**)* - if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::MapMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::Message >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage >** (p. 379), **activemq::commands::ActiveMQMessageTemplate<cms::TextMessage >** (p. 379), and **activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage >** (p. 379).

6.435.3.37 virtual void cms::Message::setDoubleProperty (const std::string & *name*, double *value*) throw (MessageNotWriteableException, CMSException) [pure virtual]

Sets a double property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException *(p. **1031**)* - if the name is an empty string.

MessageNotWriteableException *(p. **2331**)* - if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage >** (p. 380), **activemq::commands::ActiveMQMessageTemplate<cms::MapMessage >** (p. 380), **activemq::commands::ActiveMQMessageTemplate<cms::Message >** (p. 380), **activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage >** (p. 380), **activemq::commands::ActiveMQMessageTemplate<cms::TextMessage >** (p. 380), and **activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage >** (p. 380).

6.435.3.38 virtual void cms::Message::setFloatProperty (const std::string & *name*, float *value*) throw (MessageNotWriteableException, CMSException) [pure virtual]

Sets a float property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException *(p. **1031**)* - if the name is an empty string.

MessageNotWriteableException *(p. 2331)* - if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage>** (p. 380), **activemq::commands::ActiveMQMessageTemplate<cms::MapMessage>** (p. 380), **activemq::commands::ActiveMQMessageTemplate<cms::Message>** (p. 380), **activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage>** (p. 380), **activemq::commands::ActiveMQMessageTemplate<cms::TextMessage>** (p. 380), and **activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage>** (p. 380).

6.435.3.39 virtual void cms::Message::setIntProperty (const std::string & *name*, int *value*) throw (MessageNotWriteableException, CMSException) [pure virtual]

Sets a int property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException *(p. 1031)* - if the name is an empty string.

MessageNotWriteableException *(p. 2331)* - if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage>** (p. 380), **activemq::commands::ActiveMQMessageTemplate<cms::MapMessage>** (p. 380), **activemq::commands::ActiveMQMessageTemplate<cms::Message>** (p. 380), **activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage>** (p. 380), **activemq::commands::ActiveMQMessageTemplate<cms::TextMessage>** (p. 380), and **activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage>** (p. 380).

6.435.3.40 virtual void cms::Message::setLongProperty (const std::string & *name*, long long *value*) throw (MessageNotWriteableException, CMSException) [pure virtual]

Sets a long property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException *(p. 1031)* - if the name is an empty string.

MessageNotWriteableException *(p. 2331)* - if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage>** (p. 381), **activemq::commands::ActiveMQMessageTemplate<**

cms::MapMessage > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 381), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 381).

6.435.3.41 virtual void cms::Message::setShortProperty (const std::string & *name*, short *value*) throw (MessageNotWriteableException, CMSException) [pure virtual]

Sets a short property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException (p. ***1031***) - if the name is an empty string.

MessageNotWriteableException (p. ***2331***) - if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 381), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 381).

6.435.3.42 virtual void cms::Message::setStringProperty (const std::string & *name*, const std::string & *value*) throw (MessageNotWriteableException, CMSException) [pure virtual]

Sets a string property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

Exceptions:

CMSException (p. ***1031***) - if the name is an empty string.

MessageNotWriteableException (p. ***2331***) - if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate<** **cms::BytesMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::MapMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::Message** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::StreamMessage** > (p. 381), **activemq::commands::ActiveMQMessageTemplate<** **cms::TextMessage** > (p. 381), and **activemq::commands::ActiveMQMessageTemplate<** **cms::ObjectMessage** > (p. 381).

6.436 activemq::commands::MessageAck Class Reference

`#include <src/main/activemq/commands/MessageAck.h>`Inheritance diagram for activemq::commands::MessageAck:

Public Member Functions

- **MessageAck** ()
- virtual ~**MessageAck** ()
- virtual unsigned char **getDataStructureType** () const

  Get the unique identifier that this object and its own Marshaler share.

- virtual **MessageAck** * **cloneDataStructure** () const

  Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

  Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure*** (p. *1461) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure*** (p. *1461) passed in to this one, and returns if they are equivalent.*

- virtual const **Pointer**< **ActiveMQDestination** > & **getDestination** () const
- virtual **Pointer**< **ActiveMQDestination** > & **getDestination** ()
- virtual void **setDestination** (const **Pointer**< **ActiveMQDestination** > &**destination**)

6.436.1 Constructor & Destructor Documentation

6.436.1.1 activemq::commands::MessageAck::MessageAck (const MessageAck &) [inline, protected]

6.436.1.2 activemq::commands::MessageAck::MessageAck ()

6.436.1.3 virtual activemq::commands::MessageAck::~MessageAck () [virtual]

6.436.2 Member Function Documentation

6.436.2.1 virtual MessageAck* activemq::commands::MessageAck::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.436.2.2 virtual void activemq::commands::MessageAck::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.436.2.3 virtual bool activemq::commands::MessageAck::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.436.2.4 virtual unsigned char activemq::commands::MessageAck::getAckType () const [virtual]

6.436.2.5 virtual Pointer<ConsumerId>& activemq::commands::MessageAck::getConsumerId () [virtual]

6.436.2.6 virtual const Pointer<ConsumerId>& activemq::commands::MessageAck::getConsumerId () const [virtual]

6.436.2.7 virtual unsigned char activemq::commands::MessageAck::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.436.2.8 virtual Pointer<ActiveMQDestination>& activemq::commands::MessageAck::getDestination () [virtual]

6.436.2.9 virtual const Pointer<ActiveMQDestination>& activemq::commands::MessageAck::getDestination () const [virtual]

6.436.2.10 virtual Pointer<MessageId>& activemq::commands::MessageAck::getFirstMessageId () [virtual]

6.436.2.11 virtual const Pointer<MessageId>& activemq::commands::MessageAck::getFirstMessageId () const [virtual]

6.436.2.12 virtual Pointer<MessageId>& activemq::commands::MessageAck::getLastMessageId () [virtual]

6.436.2.13 virtual const Pointer<MessageId>& activemq::commands::MessageAck::getLastMessageId () const [virtual]

6.436.2.14 virtual int activemq::commands::MessageAck::getMessageCount () const [virtual]

6.436.2.15 virtual Pointer<TransactionId>& activemq::commands::MessageAck::getTransactionId () [virtual]

6.436.2.16 virtual const Pointer<TransactionId>& activemq::commands::MessageAck::getTransactionId () const [virtual]

6.436.2.17 virtual bool activemq::commands::MessageAck::isMessageAck () const [inline, virtual]

Returns:

an answer of true to the **isMessageAck()** (p. 2191) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 653).

6.436.2.18 MessageAck& activemq::commands::MessageAck::operator= (const MessageAck &) [inline, protected]

6.436.2.19 virtual void activemq::commands::MessageAck::setAckType (unsigned char *ackType*) [virtual]

6.436.2.20 virtual void activemq::commands::MessageAck::setConsumerId (const Pointer< ConsumerId > & *consumerId*) [virtual]

6.436.2.21 virtual void activemq::commands::MessageAck::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.436.2.22 virtual void activemq::commands::MessageAck::setFirstMessageId (const Pointer< MessageId > & *firstMessageId*) [virtual]

6.436.2.23 virtual void activemq::commands::MessageAck::setLastMessageId (const Pointer< MessageId > & *lastMessageId*) [virtual]

6.436.2.24 virtual void activemq::commands::MessageAck::setMessageCount (int *messageCount*) [virtual]

6.436.2.25 virtual void activemq::commands::MessageAck::setTransactionId (const Pointer< TransactionId > & *transactionId*) [virtual]

6.436.2.26 virtual std::string activemq::commands::MessageAck::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 655).

6.436.2.27 virtual Pointer<Command> activemq::commands::MessageAck::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1067).

  Write a object instance to data output stream.

6.437.1 Detailed Description

Marshaling code for Open Wire Format for **MessageAckMarshaller** (p. 2194). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.437.2 Constructor & Destructor Documentation

6.437.2.1 activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::MessageAckMarshal () [inline]

6.437.2.2 virtual activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::~MessageAckMarsh () [inline, virtual]

6.437.3 Member Function Documentation

6.437.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.437.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.437.3.3 virtual void activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 686).

6.437.3.4 virtual void activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 687).

6.437.3.5 virtual int activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 688).

6.437.3.6 virtual void activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 689).

6.437.3.7 virtual void activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 690).

  Write a object instance to data output stream.

6.438.1 Detailed Description

Marshaling code for Open Wire Format for **MessageAckMarshaller** (p. 2198). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.438.2 Constructor & Destructor Documentation

6.438.2.1 activemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::MessageAckMarshal () [inline]

6.438.2.2 virtual activemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::~MessageAckMarsh () [inline, virtual]

6.438.3 Member Function Documentation

6.438.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.438.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.438.3.3 virtual void activemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 679).

6.438.3.4 virtual void activemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 680).

6.438.3.5 virtual int activemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 681).

6.438.3.6 virtual void activemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 682).

6.438.3.7 virtual void activemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 683).

6.439.2.2 virtual activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::~MessageAckMarsh () [inline, virtual]

6.439.3 Member Function Documentation

6.439.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.439.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.439.3.3 virtual void activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 658).

6.439.3.4 virtual void activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 659).

6.439.3.5 virtual int activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 660).

6.439.3.6 virtual void activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 661).

6.439.3.7 virtual void activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 662).

The documentation for this class was generated from the following file:

6.440.3 Member Function Documentation

6.440.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.440.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.440.3.3 virtual void activemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 672).

6.440.3.4 virtual void activemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 673).

6.440.3.5 virtual int activemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 674).

6.440.3.6 virtual void activemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 675).

6.440.3.7 virtual void activemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 676).

6.441.3 Member Function Documentation

6.441.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.441.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.441.3.3 virtual void activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 665).

6.441.3.4 virtual void activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 666).

6.441.3.5 virtual int activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 667).

6.441.3.6 virtual void activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 668).

6.441.3.7 virtual void activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 669).

6.442 cms::MessageConsumer Class Reference

A client uses a `MessageConsumer` (p. 2214) to received messages from a destination.

`#include <src/main/cms/MessageConsumer.h>`Inheritance diagram for cms::MessageConsumer:

Public Member Functions

- virtual ~**MessageConsumer** ()
- virtual **Message** * **receive** ()=0 throw (CMSException)

  *Synchronously Receive a **Message** (p. 2163).*

- virtual **Message** * **receive** (int millisecs)=0 throw (CMSException)

  *Synchronously Receive a **Message** (p. 2163), time out after defined interval.*

- virtual **Message** * **receiveNoWait** ()=0 throw (CMSException)

  *Receive a **Message** (p. 2163), does not wait if there isn't a new message to read, returns NULL if nothing read.*

- virtual void **setMessageListener** (**MessageListener** *listener)=0 throw (CMSException)

  *Sets the **MessageListener** (p. 2304) that this class will send notifs on.*

- virtual **MessageListener** * **getMessageListener** () const =0 throw (CMSException)

  *Gets the **MessageListener** (p. 2304) that this class will send mew **Message** (p. 2163) notification events to.*

- virtual std::string **getMessageSelector** () const =0 throw (cms::CMSException)

  Gets this message consumer's message selector expression.

6.442.1 Detailed Description

A client uses a `MessageConsumer` (p. 2214) to received messages from a destination. A client may either synchronously receive a message consumer's messages or have the consumer asynchronously deliver them as they arrive.

For synchronous receipt, a client can request the next message from a message consumer using one of its `receive` methods. There are several variations of `receive` that allow a client to poll or wait for the next message.

For asynchronous delivery, a client can register a `MessageListener` (p. 2304) object with a message consumer. As messages arrive at the message consumer, it delivers them by calling the `MessageListener` (p. 2304)'s `onMessage` method.

When the MessageConsumer's close method is called the method can block while an asynchronous message delivery is in progress or until a `receive` operation completes. A blocked consumer in a `receive` call will return a Null when the close method is called.

See also:

MessageListener (p. 2304)

Since:

1.0

6.442.2 Constructor & Destructor Documentation

6.442.2.1 virtual cms::MessageConsumer::~MessageConsumer () [inline, virtual]

6.442.3 Member Function Documentation

6.442.3.1 virtual MessageListener* cms::MessageConsumer::getMessageListener () const throw (CMSException) [pure virtual]

Gets the **MessageListener** (p. 2304) that this class will send mew **Message** (p. 2163) notification events to.

Returns:

The listener of messages received by this consumer

Exceptions:

CMSException (p. ***1031***) - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 954), and **activemq::core::ActiveMQConsumer** (p. 268).

6.442.3.2 virtual std::string cms::MessageConsumer::getMessageSelector () const throw (cms::CMSException) [pure virtual]

Gets this message consumer's message selector expression.

Returns:

This Consumer's selector expression or "".

Exceptions:

CMSException (p. ***1031***) - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 954), and **activemq::core::ActiveMQConsumer** (p. 268).

6.442.3.3 virtual Message* cms::MessageConsumer::receive (int *millisecs*) throw (CMSException) [pure virtual]

Synchronously Receive a **Message** (p. 2163), time out after defined interval. Returns null if nothing read.

Returns:

new message which the caller owns and must delete.

Exceptions:

CMSException *(*p. ***1031***) - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 954), and **activemq::core::ActiveMQConsumer** (p. 269).

6.442.3.4 virtual Message* cms::MessageConsumer::receive () throw (CMSException) [pure virtual]

Synchronously Receive a **Message** (p. 2163).

Returns:

new message which the caller owns and must delete.

Exceptions:

CMSException *(*p. ***1031***) - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 955), and **activemq::core::ActiveMQConsumer** (p. 269).

6.442.3.5 virtual Message* cms::MessageConsumer::receiveNoWait () throw (CMSException) [pure virtual]

Receive a **Message** (p. 2163), does not wait if there isn't a new message to read, returns NULL if nothing read.

Returns:

new message which the caller owns and must delete.

Exceptions:

CMSException *(*p. ***1031***) - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 955), and **activemq::core::ActiveMQConsumer** (p. 269).

6.442.3.6 virtual void cms::MessageConsumer::setMessageListener (MessageListener * *listener*) throw (CMSException) [pure virtual]

Sets the **MessageListener** (p. 2304) that this class will send notifs on.

Parameters:

listener The listener of messages received by this consumer.

Exceptions:

CMSException *(*p. ***1031***) - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 955), and **activemq::core::ActiveMQConsumer** (p. 270).

The documentation for this class was generated from the following file:

6.444.1.3 virtual activemq::commands::MessageDispatch::~MessageDispatch () [virtual]

6.444.2 Member Function Documentation

6.444.2.1 virtual MessageDispatch* activemq::commands::MessageDispatch::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.444.2.2 virtual void activemq::commands::MessageDispatch::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.444.2.3 virtual bool activemq::commands::MessageDispatch::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.444.2.4 virtual Pointer<ConsumerId>& activemq::commands::MessageDispatch::getConsumerId () [virtual]

6.444.2.5 virtual const Pointer<ConsumerId>& activemq::commands::MessageDispatch::getConsumerId () const [virtual]

6.444.2.6 virtual unsigned char activemq::commands::MessageDispatch::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.444.2.7 virtual Pointer<ActiveMQDestination>& activemq::commands::MessageDispatch::getDestination () [virtual]

6.444.2.8 virtual const Pointer<ActiveMQDestination>& activemq::commands::MessageDispatch::getDestination () const [virtual]

6.444.2.9 virtual Pointer<Message>& activemq::commands::MessageDispatch::getMessage () [virtual]

6.444.2.10 virtual const Pointer<Message>& activemq::commands::MessageDispatch::getMessage () const [virtual]

6.444.2.11 virtual int activemq::commands::MessageDispatch::getRedeliveryCounter () const [virtual]

6.444.2.12 virtual bool activemq::commands::MessageDispatch::isMessageDispatch () const [inline, virtual]

Returns:

an answer of true to the **isMessageDispatch()** (p. 2222) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 653).

6.444.2.13 MessageDispatch& activemq::commands::MessageDispatch::operator= (const MessageDispatch &) [inline, protected]

6.444.2.14 virtual void activemq::commands::MessageDispatch::setConsumerId (const Pointer< ConsumerId > & *consumerId*) [virtual]

6.444.2.15 virtual void activemq::commands::MessageDispatch::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.444.2.16 virtual void activemq::commands::MessageDispatch::setMessage (const Pointer< Message > & *message*) [virtual]

6.444.2.17 virtual void activemq::commands::MessageDispatch::setRedeliveryCounter (int *redeliveryCounter*) [virtual]

6.444.2.18 virtual std::string activemq::commands::MessageDispatch::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 655).

6.444.2.19 virtual Pointer<Command> activemq::commands::MessageDispatch::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1067).

6.444.3 Field Documentation

6.444.3.1 Pointer<ConsumerId> activemq::commands::MessageDispatch::consumerId [protected]

6.444.3.2 Pointer<ActiveMQDestination> activemq::commands::MessageDispatch::destination [protected]

6.444.3.3 const unsigned char activemq::commands::MessageDispatch::ID_MESSAGEDISPATCH = 21 [static]

6.444.3.4 Pointer<Message> activemq::commands::MessageDispatch::message [protected]

6.444.3.5 int activemq::commands::MessageDispatch::redeliveryCounter [protected]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**MessageDispatch.h**

6.445 activemq::core::MessageDispatchChannel Class Reference

`#include <src/main/activemq/core/MessageDispatchChannel.h>`Inheritance diagram for activemq::core::MessageDispatchChannel:

Public Member Functions

- **MessageDispatchChannel** ()
- virtual ~**MessageDispatchChannel** ()
- void **enqueue** (const **Pointer**< **MessageDispatch** > &message)

  Add a Message to the Channel behind all pending message.

- void **enqueueFirst** (const **Pointer**< **MessageDispatch** > &message)

  Add a message to the front of the Channel.

- bool **isEmpty** () const
- bool **isClosed** () const
- bool **isRunning** () const
- **Pointer**< **MessageDispatch** > **dequeue** (long long timeout) throw (exceptions::ActiveMQException)

  Used to get an enqueued message.

- **Pointer**< **MessageDispatch** > **dequeueNoWait** ()

  Used to get an enqueued message if there is one queued right now.

- **Pointer**< **MessageDispatch** > **peek** () const

  Peek in the Queue and return the first message in the Channel without removing it from the channel.

- void **start** ()

  Starts dispatch of messages from the Channel.

- void **stop** ()

  Stops dispatch of message from the Channel.

- void **close** ()

  Close this channel no messages will be dispatched after this method is called.

- void **clear** ()

  Clear the Channel, all pending messages are removed.

- int **size** () const
- std::vector< **Pointer**< **MessageDispatch** > > **removeAll** ()

  Remove all messages that are currently in the Channel and return them as a list of Messages.

- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)

Locks the object.

- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)

  Unlocks the object.

- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals the waiters on this object that it can now wake up and continue.

6.445.1 Constructor & Destructor Documentation

6.445.1.1 activemq::core::MessageDispatchChannel::MessageDispatchChannel ()

6.445.1.2 virtual activemq::core::MessageDispatchChannel::~MessageDispatchChannel () [virtual]

6.445.2 Member Function Documentation

6.445.2.1 void activemq::core::MessageDispatchChannel::clear ()

Clear the Channel, all pending messages are removed.

6.445.2.2 void activemq::core::MessageDispatchChannel::close ()

Close this channel no messages will be dispatched after this method is called.

6.445.2.3 Pointer<MessageDispatch> activemq::core::MessageDispatchChannel::dequeue (long long *timeout*) throw (exceptions::ActiveMQException)

Used to get an enqueued message. The amount of time this method blocks is based on the timeout value. - if timeout==-1 then it blocks until a message is received. - if timeout==0 then it it tries to not block at all, it returns a message if it is available - if timeout>0 then it blocks up to timeout amount of time. Expired messages will consumed by this method.

Returns:

null if we timeout or if the consumer is closed.

Exceptions:

ActiveMQException

6.445.2.4 Pointer<MessageDispatch> activemq::core::MessageDispatchChannel::dequeueNoWait ()

Used to get an enqueued message if there is one queued right now. If there is no waiting message than this method returns Null.

Returns:

a message if there is one in the queue.

6.445.2.5 void activemq::core::MessageDispatchChannel::enqueue (const Pointer< MessageDispatch > & *message*)

Add a Message to the Channel behind all pending message.

Parameters:

message - The message to add to the Channel.

6.445.2.6 void activemq::core::MessageDispatchChannel::enqueueFirst (const Pointer< MessageDispatch > & *message*)

Add a message to the front of the Channel.

Parameters:

message - The Message to add to the front of the Channel.

6.445.2.7 bool activemq::core::MessageDispatchChannel::isClosed () const [inline]

Returns:

has the Queue been closed.

6.445.2.8 bool activemq::core::MessageDispatchChannel::isEmpty () const

Returns:

true if there are no messages in the Channel.

6.445.2.9 bool activemq::core::MessageDispatchChannel::isRunning () const [inline]

Returns:

true if the Channel currently running and will dequeue message.

6.445.2.10 virtual void activemq::core::MessageDispatchChannel::lock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3123).

6.445.2.11 virtual void activemq::core::MessageDispatchChannel::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3124).

6.445.2.12 virtual void activemq::core::MessageDispatchChannel::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3125).

6.445.2.13 Pointer<MessageDispatch> activemq::core::MessageDispatchChannel::peek () const

Peek in the Queue and return the first message in the Channel without removing it from the channel.

Returns:

a message if there is one in the queue.

6.445.2.14 std::vector< Pointer<MessageDispatch> > activemq::core::MessageDispatchChannel::removeAll ()

Remove all messages that are currently in the Channel and return them as a list of Messages.

Returns:

a list of Messages that was previously in the Channel.

6.445.2.15 int activemq::core::MessageDispatchChannel::size () const

Returns:

the number of Messages currently in the Channel.

6.445.2.16 void activemq::core::MessageDispatchChannel::start ()

Starts dispatch of messages from the Channel.

6.445.2.17 void activemq::core::MessageDispatchChannel::stop ()

Stops dispatch of message from the Channel.

6.445.2.18 virtual bool activemq::core::MessageDispatchChannel::tryLock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3126).

6.445.2.19 virtual void activemq::core::MessageDispatchChannel::unlock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3127).

6.445.2.20 virtual void activemq::core::MessageDispatchChannel::wait (long long *millisecs*, int *nanos*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3128).

6.445.2.21 virtual void activemq::core::MessageDispatchChannel::wait (long long *millisecs*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3130).

6.445.2.22 virtual void activemq::core::MessageDispatchChannel::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3131).

The documentation for this class was generated from the following file:

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.446.1 Detailed Description

Marshaling code for Open Wire Format for **MessageDispatchMarshaller** (p. 2231). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.446.2 Constructor & Destructor Documentation

6.446.2.1 activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::MessageDispat() [inline]

6.446.2.2 virtual activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::~MessageDispa() [inline, virtual]

6.446.3 Member Function Documentation

6.446.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.446.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::getDataStructure() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.446.3.3 virtual void activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 686).

6.446.3.4 virtual void activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 687).

6.446.3.5 virtual int activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 688).

6.446.3.6 virtual void activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 689).

6.446.3.7 virtual void activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 690).

6.447.2 Constructor & Destructor Documentation

6.447.2.1 activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::MessageDispat() [inline]

6.447.2.2 virtual activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::~MessageDispa() [inline, virtual]

6.447.3 Member Function Documentation

6.447.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::createObject() const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.447.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::getDataStructure() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.447.3.3 virtual void activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::looseMarshal(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 672).

6.447.3.4 virtual void activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 673).

6.447.3.5 virtual int activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 674).

6.447.3.6 virtual void activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 675).

6.447.3.7 virtual void activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 676).

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.448.1 Detailed Description

Marshaling code for Open Wire Format for **MessageDispatchMarshaller** (p. 2239). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.448.2 Constructor & Destructor Documentation

6.448.2.1 activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::MessageDispat() [inline]

6.448.2.2 virtual activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::~MessageDispa() [inline, virtual]

6.448.3 Member Function Documentation

6.448.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::createObject() const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.448.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::getDataStructure() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.448.3.3 virtual void activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::looseMarshal(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 658).

6.448.3.4 virtual void activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 659).

6.448.3.5 virtual int activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 660).

6.448.3.6 virtual void activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 661).

6.448.3.7 virtual void activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 662).

The documentation for this class was generated from the following file:

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.449.3.3 virtual void activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::looseMarshal(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 665).

6.449.3.4 virtual void activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 666).

6.449.3.5 virtual int activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 667).

6.449.3.6 virtual void activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 668).

6.449.3.7 virtual void activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 669).

6.450.3 Member Function Documentation

6.450.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::createObject() const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.450.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::getDataStructure() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.450.3.3 virtual void activemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::looseMarshal(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 679).

6.450.3.4 virtual void activemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 680).

6.450.3.5 virtual int activemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 681).

6.450.3.6 virtual void activemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 682).

6.450.3.7 virtual void activemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 683).

6.451.1 Constructor & Destructor Documentation

6.451.1.1 activemq::commands::MessageDispatchNotification::MessageDispatchNotification (const MessageDispatchNotification &) [inline, protected]

6.451.1.2 activemq::commands::MessageDispatchNotification::MessageDispatchNotification ()

6.451.1.3 virtual activemq::commands::MessageDispatchNotification::~MessageDispatchNotification () [virtual]

6.451.2 Member Function Documentation

6.451.2.1 virtual MessageDispatchNotification* activemq::commands::MessageDispatchNotification::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.451.2.2 virtual void activemq::commands::MessageDispatchNotification::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.451.2.3 virtual bool activemq::commands::MessageDispatchNotification::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.451.2.4 virtual Pointer<ConsumerId>& activemq::commands::MessageDispatchNotification::getConsumerId () [virtual]

6.451.2.5 virtual const Pointer<ConsumerId>& activemq::commands::MessageDispatchNotification::getConsumerId () const [virtual]

6.451.2.6 virtual unsigned char activemq::commands::MessageDispatchNotification::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.451.2.7 virtual long long activemq::commands::MessageDispatchNotification::getDeliverySequenceId () const [virtual]

6.451.2.8 virtual Pointer<ActiveMQDestination>& activemq::commands::MessageDispatchNotification::getDestination () [virtual]

6.451.2.10 virtual Pointer<MessageId>& activemq::commands::MessageDispatchNotification::getMessageId () [virtual]

6.451.2.11 virtual const Pointer<MessageId>& activemq::commands::MessageDispatchNotification::getMessageId () const [virtual]

6.451.2.12 virtual bool activemq::commands::MessageDispatchNotification::isMessageDispatchNotification () const [inline, virtual]

Returns:

an answer of true to the **isMessageDispatchNotification()** (p. 2254) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 654).

6.451.2.13 MessageDispatchNotification& activemq::commands::MessageDispatchNotification::operator= (const MessageDispatchNotification &) [inline, protected]

6.451.2.14 virtual void activemq::commands::MessageDispatchNotification::setConsumerId (const Pointer< ConsumerId > & *consumerId*) [virtual]

6.451.2.15 virtual void activemq::commands::MessageDispatchNotification::setDeliverySequenceId (long long *deliverySequenceId*) [virtual]

6.451.2.16 virtual void activemq::commands::MessageDispatchNotification::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.451.2.17 virtual void activemq::commands::MessageDispatchNotification::setMessageId (const Pointer< MessageId > & *messageId*) [virtual]

6.451.2.18 virtual std::string activemq::commands::MessageDispatchNotification::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 655).

6.451.2.19 virtual Pointer<Command> activemq::commands::MessageDispatchNotification::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the visitor.

Returns:

a **Response** (p. 2781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1067).

() const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.452.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller::getDa
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.452.3.3 virtual void activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller::looseM
(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 686).

6.452.3.4 virtual void activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller::looseU (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 687).

6.452.3.5 virtual int activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller::tightM (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 688).

6.452.3.6 virtual void activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller::tightM (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 689).

6.452.3.7 virtual void activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller::tightU (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 690).

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 679).

6.456.3.4 virtual void activemq::wireformat::openwire::marshal::v5::MessageDispatchNotificationMarshaller::looseU (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 680).

6.456.3.5 virtual int activemq::wireformat::openwire::marshal::v5::MessageDispatchNotificationMarshaller::tightM (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 681).

6.456.3.6 virtual void activemq::wireformat::openwire::marshal::v5::MessageDispatchNotificationMarshaller::tightM (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 682).

6.456.3.7 virtual void activemq::wireformat::openwire::marshal::v5::MessageDispatchNotificationMarshaller::tightU (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 683).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v5/**MessageDispatchNotificationMarshaller.h**

6.457 cms::MessageEOFException Class Reference

This exception must be thrown when an unexpected end of stream has been reached when a **StreamMessage** (p. 3081) or **BytesMessage** (p. 938) is being read.

`#include <src/main/cms/MessageEOFException.h>`Inheritance diagram for cms::MessageEOFException:

Public Member Functions

- **MessageEOFException** () throw ()

6.458 cms::MessageFormatException Class Reference

This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type.

`#include <src/main/cms/MessageFormatException.h>`Inheritance diagram for cms::MessageFormatException:

Public Member Functions

- **MessageFormatException** () throw ()
- **MessageFormatException** (const **MessageFormatException** &ex) throw ()
- **MessageFormatException** (const std::string &message, const std::exception *cause) throw ()
- **MessageFormatException** (const std::string &message, const std::exception *cause, const std::vector< std::pair< std::string, int > > &stackTrace) throw ()
- virtual ~**MessageFormatException** () throw ()

6.458.1 Detailed Description

This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type. It must also be thrown when equivalent type errors are made with message property values. For example, this exception must be thrown if **StreamMessage.readShort** (p. 3088) is used to read a boolean value.

Since:

1.3

6.459.1 Member Typedef Documentation

6.459.1.1 typedef decaf::lang::PointerComparator<MessageId> activemq::commands::MessageId::COMPARATOR

6.459.2 Constructor & Destructor Documentation

6.459.2.1 activemq::commands::MessageId::MessageId ()

6.459.2.2 activemq::commands::MessageId::MessageId (const MessageId & *other*)

6.459.2.3 virtual activemq::commands::MessageId::~MessageId () [virtual]

6.459.3 Member Function Documentation

6.459.3.1 virtual MessageId* activemq::commands::MessageId::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.459.3.2 virtual int activemq::commands::MessageId::compareTo (const MessageId & *value*) const [virtual]

6.459.3.3 virtual void activemq::commands::MessageId::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Implements **activemq::commands::DataStructure** (p. 1462).

6.459.3.4 virtual bool activemq::commands::MessageId::equals (const MessageId & *value*) const [virtual]

6.459.3.5 virtual bool activemq::commands::MessageId::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1463).

6.459.3.6 virtual long long activemq::commands::MessageId::getBrokerSequenceId () const [virtual]

6.459.3.7 virtual unsigned char activemq::commands::MessageId::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.459.3.8 virtual Pointer<ProducerId>& activemq::commands::MessageId::getProducerId () [virtual]

6.459.3.9 virtual const Pointer<ProducerId>& activemq::commands::MessageId::getProducerId () const [virtual]

6.459.3.10 virtual long long activemq::commands::MessageId::getProducerSequenceId () const [virtual]

6.459.3.11 virtual bool activemq::commands::MessageId::operator< (const MessageId & *value*) const [virtual]

6.459.3.12 MessageId& activemq::commands::MessageId::operator= (const MessageId & *other*)

6.459.3.13 virtual bool activemq::commands::MessageId::operator== (const MessageId & *value*) const [virtual]

6.459.3.14 virtual void activemq::commands::MessageId::setBrokerSequenceId (long long *brokerSequenceId*) [virtual]

6.459.3.15 virtual void activemq::commands::MessageId::setProducerId (const Pointer< ProducerId > & *producerId*) [virtual]

6.459.3.16 virtual void activemq::commands::MessageId::setProducerSequenceId (long long *producerSequenceId*) [virtual]

6.459.3.17 virtual std::string activemq::commands::MessageId::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 718).

6.459.4 Field Documentation

6.460.3 Member Function Documentation

6.460.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.460.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.460.3.3 virtual void activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.460.3.4 virtual void activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.460.3.5 virtual int activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.460.3.6 virtual void activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.460.3.7 virtual void activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

6.461.3 Member Function Documentation

6.461.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::MessageIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.461.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::MessageIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.461.3.3 virtual void activemq::wireformat::openwire::marshal::v4::MessageIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.461.3.4 virtual void activemq::wireformat::openwire::marshal::v4::MessageIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.461.3.5 virtual int activemq::wireformat::openwire::marshal::v4::MessageIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.461.3.6 virtual void activemq::wireformat::openwire::marshal::v4::MessageIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.461.3.7 virtual void activemq::wireformat::openwire::marshal::v4::MessageIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.462.3.6 virtual void activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.462.3.7 virtual void activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

6.463.2.2 virtual activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::~MessageIdMarshalle () [inline, virtual]

6.463.3 Member Function Documentation

6.463.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.463.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.463.3.3 virtual void activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.463.3.4 virtual void activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.463.3.5 virtual int activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.463.3.6 virtual void activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.463.3.7 virtual void activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.464.3.4 virtual void activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.464.3.5 virtual int activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.464.3.6 virtual void activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.464.3.7 virtual void activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

The documentation for this class was generated from the following file:

6.465 cms::MessageListener Class Reference

A `MessageListener` (p. 2304) object is used to receive asynchronously delivered messages.

`#include <src/main/cms/MessageListener.h>`

Public Member Functions

- virtual ~**MessageListener** ()
- virtual void **onMessage** (const **Message** *message)=0

  *Called asynchronously when a new message is received, the message reference can be to any of the **Message** (p. 2163) types.*

6.465.1 Detailed Description

A `MessageListener` (p. 2304) object is used to receive asynchronously delivered messages.

Since:

1.0

6.465.2 Constructor & Destructor Documentation

6.465.2.1 virtual cms::MessageListener::~MessageListener () [inline, virtual]

6.465.3 Member Function Documentation

6.465.3.1 virtual void cms::MessageListener::onMessage (const Message * *message*) [pure virtual]

Called asynchronously when a new message is received, the message reference can be to any of the **Message** (p. 2163) types. a dynamic cast is used to find out what type of message this is. The lifetime of this object is only guaranteed to be for life of the onMessage function after this call-back returns the message may no longer exists. Users should copy the data or clone the message if they wish to retain information that was contained in this **Message** (p. 2163).

It is considered a programming error for this method to throw an exception.

Parameters:

message **Message** (p. 2163) object {const} pointer recipient does not own.

The documentation for this class was generated from the following file:

- src/main/cms/**MessageListener.h**

6.466 activemq::wireformat::openwire::marshal::v2::MessageMarshaller Class Reference

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 689).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller** (p. 195), **activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller** (p. 231), **activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller** (p. 340), **activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller** (p. 363), **activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller** (p. 404), **activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller** (p. 497), and **activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller** (p. 596).

6.466.3.5 virtual void activemq::wireformat::openwire::marshal::v2::MessageMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 690).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller** (p. 196), **activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller** (p. 232), **activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller** (p. 341), **activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller** (p. 364), **activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller** (p. 405), **activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller** (p. 498), and **activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller** (p. 597).

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 672).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::ActiveMQBlobMessageMarshaller** (p. 186), **activemq::wireformat::openwire::marshal::v4::ActiveMQBytesMessageMarshaller** (p. 222), **activemq::wireformat::openwire::marshal::v4::ActiveMQMapMessageMarshaller** (p. 331), **activemq::wireformat::openwire::marshal::v4::ActiveMQMessageMarshaller** (p. 354), **activemq::wireformat::openwire::marshal::v4::ActiveMQObjectMessageMarshaller** (p. 395), **activemq::wireformat::openwire::marshal::v4::ActiveMQStreamMessageMarshaller** (p. 488), and **activemq::wireformat::openwire::marshal::v4::ActiveMQTextMessageMarshaller** (p. 587).

6.467.3.2 virtual void activemq::wireformat::openwire::marshal::v4::MessageMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 673).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::ActiveMQBlobMessageMarshaller** (p. 187), **activemq::wireformat::openwire::marshal::v4::ActiveMQBytesMessageMarshaller** (p. 223), **activemq::wireformat::openwire::marshal::v4::ActiveMQMapMessageMarshaller** (p. 332), **activemq::wireformat::openwire::marshal::v4::ActiveMQMessageMarshaller** (p. 355), **activemq::wireformat::openwire::marshal::v4::ActiveMQObjectMessageMarshaller** (p. 396), **activemq::wireformat::openwire::marshal::v4::ActiveMQStreamMessageMarshaller** (p. 489), and **activemq::wireformat::openwire::marshal::v4::ActiveMQTextMessageMarshaller** (p. 588).

6.467.3.3 virtual int activemq::wireformat::openwire::marshal::v4::MessageMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 674).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::ActiveMQBlobMessageMarshaller** (p. 187), **activemq::wireformat::openwire::marshal::v4::ActiveMQBytesMessageMarshaller** (p. 223), **activemq::wireformat::openwire::marshal::v4::ActiveMQMapMessageMarshaller** (p. 332), **activemq::wireformat::openwire::marshal::v4::ActiveMQMessageMarshaller** (p. 355), **activemq::wireformat::openwire::marshal::v4::ActiveMQObjectMessageMarshaller** (p. 396), **activemq::wireformat::openwire::marshal::v4::ActiveMQStreamMessageMarshaller** (p. 489), and **activemq::wireformat::openwire::marshal::v4::ActiveMQTextMessageMarshaller** (p. 588).

6.467.3.4 virtual void activemq::wireformat::openwire::marshal::v4::MessageMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 675).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::ActiveMQBlobMessageMarshaller** (p. 187), **activemq::wireformat::openwire::marshal::v4::ActiveMQBytesMessageMarshaller** (p. 223), **activemq::wireformat::openwire::marshal::v4::ActiveMQMapMessageMarshaller** (p. 332), **activemq::wireformat::openwire::marshal::v4::ActiveMQMessageMarshaller** (p. 355), **activemq::wireformat::openwire::marshal::v4::ActiveMQObjectMessageMarshaller** (p. 396), **activemq::wireformat::openwire::marshal::v4::ActiveMQStreamMessageMarshaller** (p. 489), and **activemq::wireformat::openwire::marshal::v4::ActiveMQTextMessageMarshaller** (p. 588).

6.467.3.5 virtual void activemq::wireformat::openwire::marshal::v4::MessageMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 676).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::ActiveMQBlobMessageMarshaller** (p. 188), **activemq::wireformat::openwire::marshal::v4::ActiveMQBytesMessageMarshaller** (p. 224), **activemq::wireformat::openwire::marshal::v4::ActiveMQMapMessageMarshaller** (p. 333), **activemq::wireformat::openwire::marshal::v4::ActiveMQMessageMarshaller** (p. 356), **activemq::wireformat::openwire::marshal::v4::ActiveMQObjectMessageMarshaller** (p. 397), **activemq::wireformat::openwire::marshal::v4::ActiveMQStreamMessageMarshaller** (p. 490), and **activemq::wireformat::openwire::marshal::v4::ActiveMQTextMessageMarshaller** (p. 589).

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 666).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller** (p. 183), **activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller** (p. 219), **activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller** (p. 328), **activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller** (p. 351), **activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller** (p. 392), **activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller** (p. 485), and **activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller** (p. 584).

6.470.3.3 virtual int activemq::wireformat::openwire::marshal::v1::MessageMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 667).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller** (p. 183), **activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller** (p. 219), **activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller** (p. 328), **activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller** (p. 351), **activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller** (p. 392), **activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller** (p. 485), and **activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller** (p. 584).

6.470.3.4 virtual void activemq::wireformat::openwire::marshal::v1::MessageMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 668).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller** (p. 183), **activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller** (p. 219), **activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller** (p. 328), **activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller** (p. 351), **activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller** (p. 392), **activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller** (p. 485), and **activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller** (p. 584).

  *Gets if **Message** (p. 2163) Time Stamps are disabled for this Producer.*
- virtual void **setPriority** (int priority)=0 throw (CMSException)
  Sets the Priority that this Producers sends messages at.
- virtual int **getPriority** () const =0 throw (CMSException)
  Gets the Priority level that this producer sends messages at.
- virtual void **setTimeToLive** (long long time)=0 throw (CMSException)
  Sets the Time to Live that this Producers sends messages with.
- virtual long long **getTimeToLive** () const =0 throw (CMSException)
  Gets the Time to Live that this producer sends messages with.

6.473.1 Detailed Description

A client uses a `MessageProducer (p. 2332)` object to send messages to a **Destination** (p. 1480). A `MessageProducer (p. 2332)` object is created by passing a `Destination (p. 1480)` object to a message-producer creation method supplied by a session.

A client also has the option of creating a message producer without supplying a destination. In this case, a **Destination** (p. 1480) must be provided with every send operation. A typical use for this kind of message producer is to send replies to requests using the request's CMSReplyTo destination.

A client can specify a default delivery mode, priority, and time to live for messages sent by a message producer. It can also specify the delivery mode, priority, and time to live for an individual message.

A client can specify a time-to-live value in milliseconds for each message it sends. This value defines a message expiration time that is the sum of the message's time-to-live and the GMT when it is sent (for transacted sends, this is the time the client sends the message, not the time the transaction is committed).

Since:

1.0

6.473.2 Constructor & Destructor Documentation

6.473.2.1 virtual cms::MessageProducer::~MessageProducer () `[inline, virtual]`

6.473.3 Member Function Documentation

6.473.3.1 virtual int cms::MessageProducer::getDeliveryMode () const throw (CMSException) `[pure virtual]`

Gets the delivery mode for this Producer.

Returns:

The **DeliveryMode** (p. 1478)

Exceptions:

CMSException (p. ***1031***) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 958), and **activemq::core::ActiveMQProducer** (p. 408).

6.473.3.2 virtual bool cms::MessageProducer::getDisableMessageID () const throw (CMSException) [pure virtual]

Gets if **Message** (p. 2163) Ids are disabled for this Producer.

Returns:

boolean indicating enable / disable (true / false)

Exceptions:

CMSException (p. ***1031***) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 959), and **activemq::core::ActiveMQProducer** (p. 408).

6.473.3.3 virtual bool cms::MessageProducer::getDisableMessageTimeStamp () const throw (CMSException) [pure virtual]

Gets if **Message** (p. 2163) Time Stamps are disabled for this Producer.

Returns:

boolean indicating enable / disable (true / false)

Exceptions:

CMSException (p. ***1031***) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 959), and **activemq::core::ActiveMQProducer** (p. 408).

6.473.3.4 virtual int cms::MessageProducer::getPriority () const throw (CMSException) [pure virtual]

Gets the Priority level that this producer sends messages at.

Returns:

int based priority level

Exceptions:

CMSException (p. ***1031***) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 959), and **activemq::core::ActiveMQProducer** (p. 409).

6.473.3.5 virtual long long cms::MessageProducer::getTimeToLive () const throw (CMSException) [pure virtual]

Gets the Time to Live that this producer sends messages with.

Returns:

Time to live value in milliseconds

Exceptions:

CMSException (p. ***1031***) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 959), and **activemq::core::ActiveMQProducer** (p. 409).

6.473.3.6 virtual void cms::MessageProducer::send (const Destination * *destination*, Message * *message*, int *deliveryMode*, int *priority*, long long *timeToLive*) throw (cms::CMSException, cms::MessageFormatException, cms::InvalidDestinationException, cms::UnsupportedOperationException) [pure virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Parameters:

destination The destination on which to send the message

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

Exceptions:

CMSException (p. ***1031***) - if an internal error occurs while sending the message.

MessageFormatException (p. ***2278***) - if an Invalid **Message** (p. 2163) is given.

InvalidDestinationException (p. ***1809***) - if a client uses this method with a **MessageProducer** (p. 2332) with an invalid destination.

UnsupportedOperationException (p. ***3303***) - if a client uses this method with a **MessageProducer** (p. 2332) that did not specify a destination at creation time.

Implemented in **activemq::cmsutil::CachedProducer** (p. 960), and **activemq::core::ActiveMQProducer** (p. 410).

6.473.3.7 virtual void cms::MessageProducer::send (const Destination * *destination*, Message * *message*) throw (cms::CMSException, cms::MessageFormatException, cms::InvalidDestinationException, cms::UnsupportedOperationException) [pure virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it. Uses default values for deliveryMode, priority, and time to live.

Parameters:

destination The destination on which to send the message

message the message to be sent.

Exceptions:

CMSException (p. ***1031***) - if an internal error occurs while sending the message.

MessageFormatException (p. ***2278***) - if an Invalid **Message** (p. 2163) is given.

InvalidDestinationException (p. ***1809***) - if a client uses this method with a **MessageProducer** (p. 2332) with an invalid destination.

UnsupportedOperationException (p. ***3303***) - if a client uses this method with a **MessageProducer** (p. 2332) that did not specify a destination at creation time.

Implemented in **activemq::cmsutil::CachedProducer** (p. 960), and **activemq::core::ActiveMQProducer** (p. 410).

6.473.3.8 virtual void cms::MessageProducer::send (Message * *message*, int *deliveryMode*, int *priority*, long long *timeToLive*) throw (cms::CMSException, cms::MessageFormatException, cms::InvalidDestinationException, cms::UnsupportedOperationException) [pure virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Parameters:

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

Exceptions:

CMSException (p. ***1031***) - if an internal error occurs while sending the message.

MessageFormatException (p. ***2278***) - if an Invalid **Message** (p. 2163) is given.

InvalidDestinationException (p. ***1809***) - if a client uses this method with a **MessageProducer** (p. 2332) with an invalid destination.

UnsupportedOperationException (p. ***3303***) - if a client uses this method with a **MessageProducer** (p. 2332) that did not specify a destination at creation time.

Implemented in **activemq::cmsutil::CachedProducer** (p. 961), and **activemq::core::ActiveMQProducer** (p. 411).

6.473.3.9 virtual void cms::MessageProducer::send (Message * *message*) throw (cms::CMSException, cms::MessageFormatException, cms::InvalidDestinationException, cms::UnsupportedOperationException) [pure virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it. Uses default values for deliveryMode, priority, and time to live.

Parameters:

message The message to be sent.

Exceptions:

CMSException *(*p. *1031)* - if an internal error occurs while sending the message.

MessageFormatException *(*p. *2278)* - if an Invalid **Message** (p. 2163) is given.

InvalidDestinationException *(*p. *1809)* - if a client uses this method with a **MessageProducer** (p. 2332) with an invalid destination.

UnsupportedOperationException *(*p. *3303)* - if a client uses this method with a **MessageProducer** (p. 2332) that did not specify a destination at creation time.

Implemented in **activemq::cmsutil::CachedProducer** (p. 961), and **activemq::core::ActiveMQProducer** (p. 411).

6.473.3.10 virtual void cms::MessageProducer::setDeliveryMode (int *mode*) throw (CMSException) [pure virtual]

Sets the delivery mode for this Producer.

Parameters:

mode The **DeliveryMode** (p. 1478)

Exceptions:

CMSException *(*p. *1031)* - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 962), and **activemq::core::ActiveMQProducer** (p. 412).

6.473.3.11 virtual void cms::MessageProducer::setDisableMessageID (bool *value*) throw (CMSException) [pure virtual]

Sets if **Message** (p. 2163) Ids are disabled for this Producer.

Parameters:

value boolean indicating enable / disable (true / false)

Exceptions:

CMSException *(*p. *1031)* - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 962), and **activemq::core::ActiveMQProducer** (p. 412).

6.473.3.12 virtual void cms::MessageProducer::setDisableMessageTimeStamp (bool *value*) throw (CMSException) [pure virtual]

Sets if **Message** (p. 2163) Time Stamps are disabled for this Producer.

Parameters:

value - boolean indicating enable / disable (true / false)

Exceptions:

CMSException *(*p. ***1031****)* - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 962), and **activemq::core::ActiveMQProducer** (p. 412).

6.473.3.13 virtual void cms::MessageProducer::setPriority (int *priority*) throw (CMSException) [pure virtual]

Sets the Priority that this Producers sends messages at.

Parameters:

priority int value for Priority level

Exceptions:

CMSException *(*p. ***1031****)* - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 962), and **activemq::core::ActiveMQProducer** (p. 412).

6.473.3.14 virtual void cms::MessageProducer::setTimeToLive (long long *time*) throw (CMSException) [pure virtual]

Sets the Time to Live that this Producers sends messages with. This value will be used if the time to live is not specified via the send method.

Parameters:

time default time to live value in milliseconds

Exceptions:

CMSException *(*p. ***1031****)* - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 963), and **activemq::core::ActiveMQProducer** (p. 413).

The documentation for this class was generated from the following file:

- src/main/cms/**MessageProducer.h**

6.474 activemq::wireformat::openwire::utils::MessagePropertyIntercepto Class Reference

Used the base ActiveMQMessage class to intercept calls to get and set properties in order to capture the calls that use the reserved JMS properties and get and set them in the OpenWire Message properties.

`#include <src/main/activemq/wireformat/openwire/utils/MessagePropertyInterceptor.h>`

Public Member Functions

- **MessagePropertyInterceptor** (**commands::Message** *message, **util::PrimitiveMap** *properties) throw (decaf::lang::exceptions::NullPointerException)

  Constructor, accepts the Message that will be used to store JMS reserved property values, and the PrimitiveMap to get and set the rest to.

- virtual ~**MessagePropertyInterceptor** ()
- virtual bool **getBooleanProperty** (const std::string &name) const

  Gets a boolean property.

- virtual unsigned char **getByteProperty** (const std::string &name) const

  Gets a byte property.

  Sets a short property.

- virtual void **setStringProperty** (const std::string &name, const std::string &value)

  Sets a string property.

6.474.1 Detailed Description

Used the base ActiveMQMessage class to intercept calls to get and set properties in order to capture the calls that use the reserved JMS properties and get and set them in the OpenWire Message properties. Currently the only properties that are intercepted and handled are:

Name | Conversion Supported ---------- JMSXDeliveryCount | Int, Long, String JMSXGroupID | String JMSXGroupSeq | Int, Long, String

6.474.2 Constructor & Destructor Documentation

6.474.2.1 activemq::wireformat::openwire::utils::MessagePropertyInterceptor::MessagePropertyInte (commands::Message * *message*, util::PrimitiveMap * *properties*) throw (decaf::lang::exceptions::NullPointerException)

Constructor, accepts the Message that will be used to store JMS reserved property values, and the PrimitiveMap to get and set the rest to.

Parameters:

message - The Message to store reserved property data in

properties - The PrimitiveMap to store the rest of the properties in.

Exceptions:

NullPointerException if either param is NULL

6.474.2.2 virtual activemq::wireformat::openwire::utils::MessagePropertyInterceptor::~MessagePropertyInt () [virtual]

6.474.3 Member Function Documentation

6.474.3.1 virtual bool activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getBooleanProperty (const std::string & *name*) const [virtual]

Gets a boolean property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

6.474.3.2 virtual unsigned char activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getByteProperty (const std::string & *name*) const [virtual]

Gets a byte property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

6.474.3.3 virtual double activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getDoubleProperty (const std::string & *name*) const [virtual]

Gets a double property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

6.474.3.4 virtual float activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getFloatProperty (const std::string & *name*) const [virtual]

Gets a float property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

6.474.3.5 virtual int activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getIntProperty (const std::string & *name*) const [virtual]

Gets a int property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

6.474.3.6 virtual long long activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getLongProperty (const std::string & *name*) const [virtual]

Gets a long property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

6.474.3.7 virtual short activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getShortProperty (const std::string & *name*) const [virtual]

Gets a short property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

6.474.3.8 virtual std::string activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getStringProperty (const std::string & *name*) const [virtual]

Gets a string property.

Parameters:

name The name of the property to retrieve.

Returns:

The value for the named property.

6.474.3.9 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setBooleanProperty (const std::string & *name*, bool *value*) [virtual]

Sets a boolean property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

6.474.3.10 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setByteProperty (const std::string & *name*, unsigned char *value*) [virtual]

Sets a byte property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

6.474.3.11 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setDoubleProperty (const std::string & *name*, double *value*) [virtual]

Sets a double property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

6.474.3.12 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setFloatProperty (const std::string & *name*, float *value*) [virtual]

Sets a float property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

6.474.3.13 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setIntProperty (const std::string & *name*, int *value*) [virtual]

Sets a int property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

6.474.3.14 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setLongProperty (const std::string & *name*, long long *value*) [virtual]

Sets a long property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

6.474.3.15 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setShortProperty (const std::string & *name*, short *value*) [virtual]

Sets a short property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

6.474.3.16 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setStringProperty (const std::string & *name*, const std::string & *value*) [virtual]

Sets a string property.

Parameters:

name The name of the property to retrieve.

value The value for the named property.

6.475 activemq::commands::MessagePull Class Reference

`#include <src/main/activemq/commands/MessagePull.h>`Inheritance diagram for activemq::commands::MessagePull:

Public Member Functions

- **MessagePull** ()
- virtual ~**MessagePull** ()
- virtual unsigned char **getDataStructureType** () const

  Get the unique identifier that this object and its own Marshaler share.

- virtual **MessagePull** * **cloneDataStructure** () const

  Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

  Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

  *Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

  *Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent.*

- virtual const **Pointer**< **ConsumerId** > & **getConsumerId** () const
- virtual **Pointer**< **ConsumerId** > & **getConsumerId** ()
- virtual void **setConsumerId** (const **Pointer**< **ConsumerId** > &**consumerId**)
- virtual const **Pointer**< **ActiveMQDestination** > & **getDestination** () const
- virtual **Pointer**< **ActiveMQDestination** > & **getDestination** ()
- virtual void **setDestination** (const **Pointer**< **ActiveMQDestination** > &**destination**)

6.475.1 Constructor & Destructor Documentation

6.475.1.1 activemq::commands::MessagePull::MessagePull (const MessagePull &) [inline, protected]

6.475.1.2 activemq::commands::MessagePull::MessagePull ()

6.475.1.3 virtual activemq::commands::MessagePull::~MessagePull () [virtual]

6.475.2 Member Function Documentation

6.475.2.1 virtual MessagePull* activemq::commands::MessagePull::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.475.2.2 virtual void activemq::commands::MessagePull::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.475.2.3 virtual bool activemq::commands::MessagePull::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 651).

6.475.2.4 virtual Pointer<ConsumerId>& activemq::commands::MessagePull::getConsumerId () [virtual]

6.475.2.5 virtual const Pointer<ConsumerId>& activemq::commands::MessagePull::getConsumerId () const [virtual]

6.475.2.6 virtual std::string& activemq::commands::MessagePull::getCorrelationId () [virtual]

6.475.2.7 virtual const std::string& activemq::commands::MessagePull::getCorrelationId () const [virtual]

6.475.2.8 virtual unsigned char activemq::commands::MessagePull::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.475.2.9 virtual Pointer<ActiveMQDestination>& activemq::commands::MessagePull::getDestination () [virtual]

6.475.2.10 virtual const Pointer<ActiveMQDestination>& activemq::commands::MessagePull::getDestination () const [virtual]

6.475.2.11 virtual Pointer<MessageId>& activemq::commands::MessagePull::getMessageId () [virtual]

6.475.2.12 virtual const Pointer<MessageId>& activemq::commands::MessagePull::getMessageId () const [virtual]

6.475.2.13 virtual long long activemq::commands::MessagePull::getTimeout () const [virtual]

6.475.2.14 MessagePull& activemq::commands::MessagePull::operator= (const MessagePull &) [inline, protected]

6.475.2.15 virtual void activemq::commands::MessagePull::setConsumerId (const Pointer< ConsumerId > & *consumerId*) [virtual]

6.475.2.16 virtual void activemq::commands::MessagePull::setCorrelationId (const std::string & *correlationId*) [virtual]

6.475.2.17 virtual void activemq::commands::MessagePull::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.475.2.18 virtual void activemq::commands::MessagePull::setMessageId (const Pointer< MessageId > & *messageId*) [virtual]

6.475.2.19 virtual void activemq::commands::MessagePull::setTimeout (long long *timeout*) [virtual]

6.475.2.20 virtual std::string activemq::commands::MessagePull::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 655).

6.475.2.21 virtual Pointer<Command> activemq::commands::MessagePull::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited. The command will call the proper processXXX method in the

visitor.

Returns:

a **Response** (p. 2781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1067).

6.475.3 Field Documentation

6.475.3.1 Pointer<ConsumerId> activemq::commands::MessagePull::consumerId [protected]

6.475.3.2 std::string activemq::commands::MessagePull::correlationId [protected]

6.475.3.3 Pointer<ActiveMQDestination> activemq::commands::MessagePull::destination [protected]

  Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.476.1 Detailed Description

Marshaling code for Open Wire Format for **MessagePullMarshaller** (p. 2351). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.476.2 Constructor & Destructor Documentation

6.476.2.1 activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::MessagePullMarsha () [inline]

6.476.2.2 virtual activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::~MessagePullMarsh () [inline, virtual]

6.476.3 Member Function Documentation

6.476.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.476.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.476.3.3 virtual void activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 686).

6.476.3.4 virtual void activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 687).

6.476.3.5 virtual int activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 688).

6.476.3.6 virtual void activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 689).

6.476.3.7 virtual void activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 690).

The documentation for this class was generated from the following file:

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 660).

6.477.3.6 virtual void activemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 661).

6.477.3.7 virtual void activemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 662).

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 667).

6.478.3.6 virtual void activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 668).

6.478.3.7 virtual void activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 669).

The documentation for this class was generated from the following file:

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.479.1 Detailed Description

Marshaling code for Open Wire Format for **MessagePullMarshaller** (p. 2363). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.479.2 Constructor & Destructor Documentation

6.479.2.1 activemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::MessagePullMarsha () [inline]

6.479.2.2 virtual activemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::~MessagePullMarsh () [inline, virtual]

6.479.3 Member Function Documentation

6.479.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.479.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.479.3.3 virtual void activemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 679).

6.479.3.4 virtual void activemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 680).

6.479.3.5 virtual int activemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 681).

6.479.3.6 virtual void activemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 682).

6.479.3.7 virtual void activemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 683).

6.480.2.2 virtual activemq::wireformat::openwire::marshal::v4::MessagePullMarshaller::~MessagePullMarsh () [inline, virtual]

6.480.3 Member Function Documentation

6.480.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::MessagePullMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.480.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::MessagePullMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.480.3.3 virtual void activemq::wireformat::openwire::marshal::v4::MessagePullMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 672).

6.480.3.4 virtual void activemq::wireformat::openwire::marshal::v4::MessagePullMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 673).

6.480.3.5 virtual int activemq::wireformat::openwire::marshal::v4::MessagePullMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 674).

6.480.3.6 virtual void activemq::wireformat::openwire::marshal::v4::MessagePullMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 675).

6.480.3.7 virtual void activemq::wireformat::openwire::marshal::v4::MessagePullMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 676).

6.481 activemq::transport::mock::MockTransport Class Reference

The **MockTransport** (p. 2371) defines a base level **Transport** (p. 3273) class that is intended to be used in place of an a regular protocol **Transport** (p. 3273) suck as TCP.

`#include <src/main/activemq/transport/mock/MockTransport.h>`Inheritance diagram for activemq::transport::mock::MockTransport:

Public Member Functions

- **MockTransport** (const **Pointer**< **wireformat::WireFormat** > &wireFormat, const **Pointer**< **ResponseBuilder** > &responseBuilder)
- virtual ~**MockTransport** ()
- void **setResponseBuilder** (const **Pointer**< **ResponseBuilder** > &responseBuilder)

  *Sets the **ResponseBuilder** (p. 2785) that this class uses to create Responses to Commands sent.*

- virtual void **oneway** (const **Pointer**< **Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

  Sends a one-way command.

- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

  Sends the given command to the broker and then waits for the response.

- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

  Sends the given command to the broker and then waits for the response.

- virtual void **setOutgoingListener** (**TransportListener** *listener)

  Sets a Listener that gets notified for every command that would have been sent by this transport to the Broker, this allows a client to verify that its messages are making it to the wire.

- virtual void **setWireFormat** (const **Pointer**< **wireformat::WireFormat** > &wireFormat AMQCPP_UNUSED)

  Sets the WireFormat instance to use.

- **Pointer**< **wireformat::WireFormat** > **getWireFormat** () const

  Gets the currently set WireFormat.

- virtual void **setTransportListener** (**TransportListener** *listener)

  Sets the observer of asynchronous exceptions from this transport.

- virtual **TransportListener** * **getTransportListener** () const

  Gets the observer of asynchronous exceptions from this transport.

- virtual void **fireCommand** (const **Pointer**< **Command** > &command)

Fires a Command back through this transport to its registered CommandListener if there is one.

- virtual void **fireException** (const **exceptions::ActiveMQException** &ex)

  Fires a Exception back through this transport to its registered ExceptionListener if there is one.

- virtual void **start** () throw (decaf::io::IOException)

  *Starts the **Transport** (p. 3273), the send methods of a **Transport** (p. 3273) will throw an exception if used before the **Transport** (p. 3273) is started.*

- virtual void **stop** () throw (decaf::io::IOException)

  *Stops the **Transport** (p. 3273).*

- virtual void **close** () throw (decaf::io::IOException)

  Closes this object and deallocates the appropriate resources.

- virtual **Transport** * **narrow** (const std::type_info &typeId)

  *Narrows down a Chain of Transports to a specific **Transport** (p. 3273) to allow a higher level transport to skip intermediate Transports in certain circumstances.*

- virtual bool **isFaultTolerant** () const

  *Is this **Transport** (p. 3273) fault tolerant, meaning that it will reconnect to a broker on disconnect.*

- virtual bool **isConnected** () const

  *Is the **Transport** (p. 3273) Connected to its Broker.*

- virtual bool **isClosed** () const

  *Has the **Transport** (p. 3273) been shutdown and no longer usable.*

- virtual std::string **getRemoteAddress** () const
- virtual void **reconnect** (const **decaf::net::URI** &uri AMQCPP_UNUSED) throw (decaf::io::IOException)

  reconnect to another location

6.481.1 Detailed Description

The **MockTransport** (p. 2371) defines a base level **Transport** (p. 3273) class that is intended to be used in place of an a regular protocol **Transport** (p. 3273) suck as TCP. This **Transport** (p. 3273) assumes that it is the base **Transport** (p. 3273) in the Transports stack, and destroys any Transports that are passed to it in its constructor.

This **Transport** (p. 3273) defines an Interface **ResponseBuilder** (p. 2785) which must be implemented by any protocol for which the **Transport** (p. 3273) is used to Emulate. The **Transport** (p. 3273) hands off all outbound commands to the **ResponseBuilder** (p. 2785) for processing, it is up to the builder to create appropriate responses and schedule any asynchronous messages that might result from a message sent to the Broker.

6.481.2 Constructor & Destructor Documentation

6.481.2.1 activemq::transport::mock::MockTransport::MockTransport (const Pointer< wireformat::WireFormat > & *wireFormat*, const Pointer< ResponseBuilder > & *responseBuilder*)

6.481.2.2 virtual activemq::transport::mock::MockTransport::~MockTransport () [inline, virtual]

6.481.3 Member Function Documentation

6.481.3.1 virtual void activemq::transport::mock::MockTransport::close () throw (decaf::io::IOException) [virtual]

Closes this object and deallocates the appropriate resources. The object is generally no longer usable after calling close.

Exceptions:

IOException if an error occurs while closing.

Implements **decaf::io::Closeable** (p. 1019).

6.481.3.2 virtual void activemq::transport::mock::MockTransport::fireCommand (const Pointer< Command > & *command*) [inline, virtual]

Fires a Command back through this transport to its registered CommandListener if there is one.

Parameters:

command - Command to send to the Listener.

6.481.3.3 virtual void activemq::transport::mock::MockTransport::fireException (const exceptions::ActiveMQException & *ex*) [inline, virtual]

Fires a Exception back through this transport to its registered ExceptionListener if there is one.

Parameters:

ex The Exception that will be passed on the the **Transport** (p. 3273) listener.

6.481.3.4 static MockTransport* activemq::transport::mock::MockTransport::getInstance () [inline, static]

6.481.3.5 int activemq::transport::mock::MockTransport::getNumReceivedMessageBeforeFail () const [inline]

6.481.3.6 int activemq::transport::mock::MockTransport::getNumReceivedMessages () const [inline]

6.481.3.7 int activemq::transport::mock::MockTransport::getNumSentKeepAlives () const [inline]

6.481.3.8 int activemq::transport::mock::MockTransport::getNumSentKeepAlivesBeforeFail () const [inline]

6.481.3.9 int activemq::transport::mock::MockTransport::getNumSentMessageBeforeFail () const [inline]

6.481.3.10 int activemq::transport::mock::MockTransport::getNumSentMessages () const [inline]

6.481.3.11 virtual std::string activemq::transport::mock::MockTransport::getRemoteAddress () const [inline, virtual]

Returns:

the remote address for this connection

Implements **activemq::transport::Transport** (p. 3274).

6.481.3.12 virtual TransportListener* activemq::transport::mock::MockTransport::getTransportListener () const [inline, virtual]

Gets the observer of asynchronous exceptions from this transport.

Returns:

The listener of transport events.

Implements **activemq::transport::Transport** (p. 3274).

6.481.3.13 Pointer<wireformat::WireFormat> activemq::transport::mock::MockTransport::getWireFormat () const [inline]

Gets the currently set WireFormat.

Returns:

the current WireFormat object.

6.481.3.14 virtual bool activemq::transport::mock::MockTransport::isClosed () const [inline, virtual]

Has the **Transport** (p. 3273) been shutdown and no longer usable.

Returns:

true if the **Transport** (p. 3273)

Implements **activemq::transport::Transport** (p. 3275).

6.481.3.15 virtual bool activemq::transport::mock::MockTransport::isConnected () const [inline, virtual]

Is the **Transport** (p. 3273) Connected to its Broker.

Returns:

true if a connection has been made.

Implements **activemq::transport::Transport** (p. 3275).

6.481.3.16 bool activemq::transport::mock::MockTransport::isFailOnClose () const [inline]

6.481.3.17 bool activemq::transport::mock::MockTransport::isFailOnKeepAliveSends () const [inline]

6.481.3.18 bool activemq::transport::mock::MockTransport::isFailOnReceiveMessage () const [inline]

6.481.3.19 bool activemq::transport::mock::MockTransport::isFailOnSendMessage () const [inline]

6.481.3.20 bool activemq::transport::mock::MockTransport::isFailOnStart () const [inline]

6.481.3.21 bool activemq::transport::mock::MockTransport::isFailOnStop () const [inline]

6.481.3.22 virtual bool activemq::transport::mock::MockTransport::isFaultTolerant () const [inline, virtual]

Is this **Transport** (p. 3273) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns:

true if the **Transport** (p. 3273) is fault tolerant.

Implements **activemq::transport::Transport** (p. 3275).

6.481.3.23 virtual Transport* activemq::transport::mock::MockTransport::narrow (const std::type_info & *typeId*) [inline, virtual]

Narrows down a Chain of Transports to a specific **Transport** (p. 3273) to allow a higher level transport to skip intermediate Transports in certain circumstances.

Parameters:

typeId - The type_info of the Object we are searching for.

Returns:

the requested Object. or NULL if its not in this chain.

Implements **activemq::transport::Transport** (p. 3275).

6.481.3.24 virtual void activemq::transport::mock::MockTransport::oneway (const Pointer< Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends a one-way command. Does not wait for any response from the broker.

Parameters:

command the command to be sent.

Exceptions:

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 3276).

6.481.3.25 virtual void activemq::transport::mock::MockTransport::reconnect (const decaf::net::URI &uri *AMQCPP_UNUSED*) throw (decaf::io::IOException) [inline, virtual]

reconnect to another location

Parameters:

uri

Exceptions:

IOException on failure of if not supported

6.481.3.26 virtual Pointer<Response> activemq::transport::mock::MockTransport::request (const Pointer< Command > & *command*, unsigned int *timeout*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command - The command to be sent.

timeout - The time to wait for this response.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 3276).

6.481.3.27 virtual Pointer<Response> activemq::transport::mock::MockTransport::request (const Pointer< Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters:

command the command to be sent.

Returns:

the response from the broker.

Exceptions:

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 3277).

6.481.3.28 void activemq::transport::mock::MockTransport::setFailOnClose (bool *value*) [inline]

6.481.3.29 void activemq::transport::mock::MockTransport::setFailOnKeepAliveSends (bool *value*) [inline]

6.481.3.30 void activemq::transport::mock::MockTransport::setFailOnReceiveMessage (bool *value*) [inline]

6.481.3.31 void activemq::transport::mock::MockTransport::setFailOnSendMessage (bool *value*) [inline]

6.481.3.32 void activemq::transport::mock::MockTransport::setFailOnStart (bool *value*) [inline]

6.481.3.33 void activemq::transport::mock::MockTransport::setFailOnStop (bool *value*) [inline]

6.481.3.39 void activemq::transport::mock::MockTransport::setNumSentMessages (int *value*) [inline]

6.481.3.40 virtual void activemq::transport::mock::MockTransport::setOutgoingListener (TransportListener * *listener*) [inline, virtual]

Sets a Listener that gets notified for every command that would have been sent by this transport to the Broker, this allows a client to verify that its messages are making it to the wire.

Parameters:

listener - The CommandListener to notify for each message

6.481.3.41 void activemq::transport::mock::MockTransport::setResponseBuilder (const Pointer< ResponseBuilder > & *responseBuilder*) [inline]

Sets the **ResponseBuilder** (p. 2785) that this class uses to create Responses to Commands sent. These are either real Response Objects, or Commands that would have been sent Asynchronously be the Broker.

Parameters:

responseBuilder - The **ResponseBuilder** (p. 2785) to use from now on.

6.481.3.42 virtual void activemq::transport::mock::MockTransport::setTransportListener (TransportListener * *listener*) [inline, virtual]

Sets the observer of asynchronous exceptions from this transport.

Parameters:

listener the listener of transport events.

Implements **activemq::transport::Transport** (p. 3277).

6.481.3.43 virtual void activemq::transport::mock::MockTransport::setWireFormat (const Pointer< wireformat::WireFormat > &wireFormat *AMQCPP_UNUSED*) [inline, virtual]

Sets the WireFormat instance to use.

Parameters:

wireFormat WireFormat the object used to encode / decode commands.

6.481.3.44 virtual void activemq::transport::mock::MockTransport::start () throw (decaf::io::IOException) [virtual]

Starts the **Transport** (p. 3273), the send methods of a **Transport** (p. 3273) will throw an exception if used before the **Transport** (p. 3273) is started.

Exceptions:

IOException if and error occurs while starting the **Transport** (p. 3273).

Implements **activemq::transport::Transport** (p. 3278).

6.481.3.45 virtual void activemq::transport::mock::MockTransport::stop () throw (decaf::io::IOException) [virtual]

Stops the **Transport** (p. 3273).

Exceptions:

IOException if an error occurs while stopping the transport.

Implements **activemq::transport::Transport** (p. 3278).

The documentation for this class was generated from the following file:

  *Creates a slimed down **Transport** (p. 3273) instance which can be used in composite transport instances.*

6.482.1 Detailed Description

Manufactures MockTransports, which are objects that read from input streams and write to output streams.

6.482.2 Constructor & Destructor Documentation

6.482.2.1 virtual activemq::transport::mock::MockTransportFactory::~MockTransportFactory () [inline, virtual]

6.482.3 Member Function Documentation

6.482.3.1 virtual Pointer<Transport> activemq::transport::mock::MockTransportFactory::create (const decaf::net::URI & *location*) throw (exceptions::ActiveMQException) [virtual]

Creates a fully configured **Transport** (p. 3273) instance which could be a chain of filters and transports.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQexception if an error occurs

Implements **activemq::transport::TransportFactory** (p. 3279).

6.482.3.2 virtual Pointer<Transport> activemq::transport::mock::MockTransportFactory::createComposite (const decaf::net::URI & *location*) throw (exceptions::ActiveMQException) [virtual]

Creates a slimed down **Transport** (p. 3273) instance which can be used in composite transport instances.

Parameters:

location - URI location to connect to plus any properties to assign.

Exceptions:

ActiveMQexception if an error occurs

Implements **activemq::transport::TransportFactory** (p. 3280).

6.482.3.3 virtual Pointer<Transport> activemq::transport::mock::MockTransportFactory::doCreateComposite (const decaf::net::URI & *location*, const Pointer< wireformat::WireFormat > & *wireFormat*, const decaf::util::Properties & *properties*) throw (exceptions::ActiveMQException) [protected, virtual]

Creates a slimed down **Transport** (p. 3273) instance which can be used in composite transport instances.

Parameters:

location - URI location to connect to.

wireFormat - the assigned WireFormat for the new **Transport** (p. 3273).

properties - Properties to apply to the transport.

Returns:

Pointer to a new **Transport** (p. 3273) instance.

Exceptions:

ActiveMQexception if an error occurs

Public Member Functions

- **Mutex** ()
- virtual ~**Mutex** ()
- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)

  Locks the object.

- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)

  *Attempts to **Lock** (p. 2023) the object, if the lock is already held by another thread than this method returns false.*

- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)

  Unlocks the object.

- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals the waiters on this object that it can now wake up and continue.

6.483.1 Detailed Description

Mutex (p. 2385) object that offers recursive support on all platforms as well as providing the ability to use the standard wait / notify pattern used in languages like Java.

Since:

1.0

6.483.2 Constructor & Destructor Documentation

6.483.2.1 decaf::util::concurrent::Mutex::Mutex ()

6.483.2.2 virtual decaf::util::concurrent::Mutex::~Mutex () [virtual]

6.483.3 Member Function Documentation

6.483.3.1 virtual void decaf::util::concurrent::Mutex::lock () throw (decaf::lang::exceptions::RuntimeException) [virtual]

Locks the object.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3123).

Referenced by decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::lock(), decaf::util::StlMap< std::string, cms::Topic * >::lock(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::lock(), and decaf::util::AbstractCollection< Pointer< BackupTransport > >::lock().

6.483.3.2 virtual void decaf::util::concurrent::Mutex::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [virtual]

Signals a waiter on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 3122) Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3124).

Referenced by decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::notify(), decaf::util::StlMap< std::string, cms::Topic * >::notify(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::notify(), and decaf::util::AbstractCollection< Pointer< BackupTransport > >::notify().

6.483.3.3 virtual void decaf::util::concurrent::Mutex::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [virtual]

Signals the waiters on this object that it can now wake up and continue. Must have this object locked before calling.

Exceptions:

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 3122) Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 3125).

Referenced by decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::notifyAll(), decaf::util::StlMap< std::string, cms::Topic * >::notifyAll(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::notifyAll(), and decaf::util::AbstractCollection< Pointer< BackupTransport > >::notifyAll().

6.483.3.4 virtual bool decaf::util::concurrent::Mutex::tryLock () throw (decaf::lang::exceptions::RuntimeException) [virtual]

Attempts to **Lock** (p. 2023) the object, if the lock is already held by another thread than this method returns false.

Returns:

true if the lock was acquired, false if it is already held by another thread.

Exceptions:

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3126).

Referenced by decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::tryLock(), decaf::util::StlMap< std::string, cms::Topic * >::tryLock(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::tryLock(), and decaf::util::AbstractCollection< Pointer< BackupTransport > >::tryLock().

6.483.3.5 virtual void decaf::util::concurrent::Mutex::unlock () throw (decaf::lang::exceptions::RuntimeException) [virtual]

Unlocks the object.

Exceptions:

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3127).

Referenced by decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::unlock(), decaf::util::StlMap< std::string, cms::Topic * >::unlock(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::unlock(), and decaf::util::AbstractCollection< Pointer< BackupTransport > >::unlock().

6.483.3.6 virtual void decaf::util::concurrent::Mutex::wait (long long *millisecs*, int *nanos*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions:

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 3122) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3128).

6.483.3.7 virtual void decaf::util::concurrent::Mutex::wait (long long *millisecs*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters:

millisecs the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 3122) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3130).

6.483.3.8 virtual void decaf::util::concurrent::Mutex::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [virtual]

Waits on a signal from this object, which is generated by a call to Notify. Must have this object locked before calling.

Exceptions:

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 3122) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 3131).

Referenced by decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::wait(), decaf::util::StlMap< std::string, cms::Topic * >::wait(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::wait(), and decaf::util::AbstractCollection< Pointer< BackupTransport > >::wait().

6.485 decaf::internal::util::concurrent::MutexImpl Class Reference

`#include <src/main/decaf/internal/util/concurrent/MutexImpl.h>`

Static Public Member Functions

- static **decaf::util::concurrent::MutexHandle** * **create** ()

  Creates a Reentrant Mutex and returns the handle, throws a Runtime Exception if the Mutex cannot be created for some reason.

- static void **destroy** (**decaf::util::concurrent::MutexHandle** *handle)

  Destroy a previously create Mutex instance.

- static void **lock** (**decaf::util::concurrent::MutexHandle** *handle)

  Locks the Mutex.

- static bool **trylock** (**decaf::util::concurrent::MutexHandle** *handle)

  Tries to lock the Mutex.

- static void **unlock** (**decaf::util::concurrent::MutexHandle** *handle)

  Unlocks the Mutex allowing other Thread to then acquire the Lock on it.

6.485.1 Member Function Documentation

6.485.1.1 static decaf::util::concurrent::MutexHandle* decaf::internal::util::concurrent::MutexImpl::create () [static]

Creates a Reentrant Mutex and returns the handle, throws a Runtime Exception if the Mutex cannot be created for some reason.

Returns:

handle to a newly created Mutex.

6.485.1.2 static void decaf::internal::util::concurrent::MutexImpl::destroy (decaf::util::concurrent::MutexHandle * *handle*) [static]

Destroy a previously create Mutex instance.

Parameters:

mutex The Mutex instance to be destroyed.

6.485.1.3 static void decaf::internal::util::concurrent::MutexImpl::lock (decaf::util::concurrent::MutexHandle * *handle*) [static]

Locks the Mutex. If the Mutex is already locked by another thread this method blocks until the Mutex becomes unlocked and this thread acquires the lock.

Parameters:

handle the handle to the Mutex to Lock.

6.485.1.4 static bool decaf::internal::util::concurrent::MutexImpl::trylock (decaf::util::concurrent::MutexHandle * *handle*) [static]

Tries to lock the Mutex. If the Mutex is unlocked this Thread acquires the lock on the Mutex and this method returns true, if the Mutex is already locked then the lock is not acquired and this method returns false.

Parameters:

handle the handle to the Mutex to attempt to Lock.

Returns:

true if the lock was acquired false otherwise.

6.485.1.5 static void decaf::internal::util::concurrent::MutexImpl::unlock (decaf::util::concurrent::MutexHandle * *handle*) [static]

Unlocks the Mutex allowing other Thread to then acquire the Lock on it.

Parameters:

handle the handle to the Mutex to attempt to Lock.

The documentation for this class was generated from the following file:

6.486.1.2 activemq::commands::NetworkBridgeFilter::NetworkBridgeFilter ()

6.486.1.3 virtual activemq::commands::NetworkBridgeFilter::~NetworkBridgeFilter () [virtual]

6.486.2 Member Function Documentation

6.486.2.1 virtual NetworkBridgeFilter* activemq::commands::NetworkBridgeFilter::cloneDataStructure () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns:

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1461).

6.486.2.2 virtual void activemq::commands::NetworkBridgeFilter::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters:

src - Source Object

Implements **activemq::commands::DataStructure** (p. 1462).

6.486.2.3 virtual bool activemq::commands::NetworkBridgeFilter::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1461) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns:

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1463).

6.486.2.4 virtual unsigned char activemq::commands::NetworkBridgeFilter::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns:

new **DataStructure** (p. 1461) type copy.

Implements **activemq::commands::DataStructure** (p. 1464).

6.486.2.5 virtual Pointer<BrokerId>& activemq::commands::NetworkBridgeFilter::getNetworkBrokerId () [virtual]

6.486.2.6 virtual const Pointer<BrokerId>& activemq::commands::NetworkBridgeFilter::getNetworkBrokerId () const [virtual]

6.486.2.7 virtual int activemq::commands::NetworkBridgeFilter::getNetworkTTL () const [virtual]

6.486.2.8 NetworkBridgeFilter& activemq::commands::NetworkBridgeFilter::operator= (const NetworkBridgeFilter &) [inline, protected]

6.486.2.9 virtual void activemq::commands::NetworkBridgeFilter::setNetworkBrokerId (const Pointer< BrokerId > & *networkBrokerId*) [virtual]

6.486.2.10 virtual void activemq::commands::NetworkBridgeFilter::setNetworkTTL (int *networkTTL*) [virtual]

6.486.2.11 virtual std::string activemq::commands::NetworkBridgeFilter::toString () const [virtual]

Returns a string containing the information for this **DataStructure** (p. 1461) such as its type and value of its elements.

Returns:

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 718).

6.486.3 Field Documentation

6.486.3.1 const unsigned char activemq::commands::NetworkBridgeFilter::ID_NETWORKBRIDGEFILTER = 91 [static]

6.486.3.2 Pointer<BrokerId> activemq::commands::NetworkBridgeFilter::networkBrokerId [protected]

diagram for activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller:

Public Member Functions

- **NetworkBridgeFilterMarshaller** ()
- virtual ~**NetworkBridgeFilterMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () const

  Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

  Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

  Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

  Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

  Write a object instance to data output stream.

6.487.1 Detailed Description

Marshaling code for Open Wire Format for **NetworkBridgeFilterMarshaller** (p. 2397). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.487.2 Constructor & Destructor Documentation

6.487.2.1 activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::NetworkBri () [inline]

6.487.2.2 virtual activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::~NetworkB () [inline, virtual]

6.487.3 Member Function Documentation

6.487.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.487.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::getDataStruct () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.487.3.3 virtual void activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.487.3.4 virtual void activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::looseUnmarsh (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.487.3.5 virtual int activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.487.3.6 virtual void activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

6.487.3.7 virtual void activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::tightUnmarsh (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1454).

6.488.3 Member Function Documentation

6.488.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns:

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1419).

6.488.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::getDataStruct () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns:

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.488.3.3 virtual void activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.488.3.4 virtual void activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::looseUnmarsh (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.488.3.5 virtual int activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1424).

6.491.3.3 virtual void activemq::wireformat::openwire::marshal::v4::NetworkBridgeFilterMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describs the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1430).

6.491.3.4 virtual void activemq::wireformat::openwire::marshal::v4::NetworkBridgeFilterMarshaller::looseUnmarsh (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions:

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1436).

6.491.3.5 virtual int activemq::wireformat::openwire::marshal::v4::NetworkBridgeFilterMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns:

int value indicating the size of the marshaled object.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1442).

6.491.3.6 virtual void activemq::wireformat::openwire::marshal::v4::NetworkBridgeFilterMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters:

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions:

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1448).

- **NoRouteToHostException** (const Exception &ex) throw ()
  Conversion Constructor from some other Exception.
- **NoRouteToHostException** (const **NoRouteToHostException** &ex) throw ()
  Copy Constructor.
- **NoRouteToHostException** (const char *file, const int lineNumber, const std::exception ***cause**, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- **NoRouteToHostException** (const std::exception ***cause**) throw ()
  Constructor.
- **NoRouteToHostException** (const char *file, const int lineNumber, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **NoRouteToHostException** * **clone** () const
  Clones this exception.
- virtual ~**NoRouteToHostException** () throw ()

6.492.1 Constructor & Destructor Documentation

6.492.1.1 decaf::net::NoRouteToHostException::NoRouteToHostException () throw () [inline]

Default Constructor.

6.492.1.2 decaf::net::NoRouteToHostException::NoRouteToHostException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.492.1.3 decaf::net::NoRouteToHostException::NoRouteToHostException (const NoRouteToHostException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.492.1.4 decaf::net::NoRouteToHostException::NoRouteToHostException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.492.1.5 decaf::net::NoRouteToHostException::NoRouteToHostException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.492.1.6 decaf::net::NoRouteToHostException::NoRouteToHostException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.492.1.7 virtual decaf::net::NoRouteToHostException::~NoRouteToHostException () throw () [inline, virtual]

6.492.2 Member Function Documentation

6.492.2.1 virtual NoRouteToHostException* decaf::net::NoRouteToHostException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 2973).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**NoRouteToHostException.h**

6.493 decaf::security::NoSuchAlgorithmException Class Reference

`#include <src/main/decaf/security/NoSuchAlgorithmException.h>`Inheritance diagram for decaf::security::NoSuchAlgorithmException:

Public Member Functions

- **NoSuchAlgorithmException** () throw ()
  Default Constructor.
- **NoSuchAlgorithmException** (const Exception &ex) throw ()
  Conversion Constructor from some other Exception.
- **NoSuchAlgorithmException** (const **NoSuchAlgorithmException** &ex) throw ()
  Copy Constructor.
- **NoSuchAlgorithmException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- **NoSuchAlgorithmException** (const std::exception *cause) throw ()
  Constructor.
- **NoSuchAlgorithmException** (const char *file, const int lineNumber, const char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **NoSuchAlgorithmException** * **clone** () const
  Clones this exception.
- virtual ~**NoSuchAlgorithmException** () throw ()

6.493.1 Constructor & Destructor Documentation

6.493.1.1 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException () throw () [inline]

Default Constructor.

6.493.1.2 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters:

ex An exception that should become this type of Exception

6.493.1.3 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const NoSuchAlgorithmException & *ex*) throw () [inline]

Copy Constructor.

Parameters:

ex An exception that should become this type of Exception

6.493.1.4 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.493.1.5 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters:

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.493.1.6 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred. Sets the message to report, using an optional list of arguments to parse into the message

Parameters:

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.493.1.7 virtual decaf::security::NoSuchAlgorithmException::~NoSuchAlgorithmException () throw () [inline, virtual]

6.493.2 Member Function Documentation

6.493.2.1 virtual NoSuchAlgorithmException* decaf::security::NoSuchAlgorithmException::clone () const [inline, virtual]

Clones this exception. This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns:

A deep copy of this exception.

Reimplemented from **decaf::security::GeneralSecurityException** (p. 1708).
